INTRODUCTION

THIS year's issue of the *Britannica Book of the Year* is the twentieth. For two decades—a period characterized throughout most of the world by coercions rather than by freedom—the book has been a popular annual whose area of distribution in the western hemisphere grows ever wider from year to year. Other countries need such books, as freely distributed, but the world's tyrannies do not encourage this. In the past year, however, there is striking evidence in Europe that at long last our modern version of tyranny may see its doom. Certainly the world can be at peace only when human dignity is respected and communication is free.

* * * * *

Two feature articles appear in the green section.

The growing concern about fresh-water supplies of the United States is discussed by Roscoe Fleming in "The Problem of Water." Fleming warns that this vital natural resource is limited in supply, and that the nation's future development may depend in no small measure on what we are now doing to conserve water and to develop additional sources of it. Fleming is a free-lance writer of Denver, Colo., centre of a region which has a critical water problem.

On July 4, 1946, a new Republic of the Philippines started its free and independent course with the assistance and blessings of the United States. In the second feature article, Albert Ravenholt reviews the history of the Filipino people and their land; tells of their achievements during the decade under their own leadership; and shows how democracy has fared in this region of Asia and the Pacific where live the world's great majority of awakening and uncommitted peoples. Ravenholt is a correspondent for the *Chicago Daily News* foreign service and an associate of the American Universities Field Staff, under whose auspices he is lecturing at leading educational institutions on the result of his intensive studies in the Philippines.

* * * * *

The current *Book of the Year*, as always, was made possible not only by its 600 and more authoritative contributors but by the fine co-operation of that portion of the permanent Editorial Staff which bears the burden of *Book of the Year* production.

Subeditors who checked for accuracy and prepared copy for the printer were: Judy Booth, Betty Cushman, Daphne Daume, Ruth Passin, Noreen Pine, Kathleen Ray, Helen Sund, Florence Williams and Marjorie E. Witte.

Others active in the work were indexers: Mildred W. Benson, Margaret Greenlee, Frances Latham, Janet Smith and Joan Stephenson; the Copy Control section which directs flow of copy to and from the editors, indexers and the printer: Félicité Buhl, Muriel Clarkson, Mary K. Finley, Grace Lord and Sally Recupido; Marianne Tamura, who, assisted by Catherine M. Cahill, Bernadette Rakers and Marie Reznick, prepared correspondence with contributors; Joan Bayliss and Carol Davis, who helped lay out the pages of the volume; general editorial assistants Russell Mahood and Edward Schulz; the geographer Ruth Martin; map and chart makers, Victor Figueroa, Theodore Jung, Jr., and Jobie Sayler; librarian, Adelaide Moen; typists, Ruth Bicking, Marie Chiaro, Irene Martinic and Florence Samuelson.

The work of this staff was under the general management of Mae Hallberg MacKay and her two associates, Harriet La Forge Milburn and Lorene Lawson.

The Problem of

WATER

Increasing demands
on a vital United States resource
call for a new national policy

By ROSCOE FLEMING

“THE United States can no longer treat water as an inexhaustible resource, and allow it to run a wayward and wasteful course to the sea.”—Wilbur N. Brucker, U.S. Secretary of the Army, at the dedication of the Gavins Point Dam, South Dakota, in 1955.

Not too far from where Secretary Brucker spoke, a steamboat many years ago was feeling its way up the Missouri River at low water, sometimes scraping the bottom. The pilot saw a homesteader come yawning out of his cabin on the bank and dip up a bucketful of water. Shaking his fist out the wheelhouse window, the pilot yelled, “Put that back!”

The United States is now at the “Put that back!” stage with respect to a natural resource which, next to the air itself, is basic to human life and civilization. All projections of increasing national production, consumption and prosperity should be prefaced by the stipulation “If there is enough water available.” The nation is at the end of one era, that of plentiful water, cheaply obtainable and pure enough for use without elaborate treatment, and at the beginning of another era, when the people must pay more for water, use it more thriftily, guard it more vigilantly against waste and pollution and spend more money on research and in developing new sources. As President Dwight D. Eisen-

hower said in naming his Advisory Committee on Water Resources Policy in 1955, “If we are to continue to advance agriculturally and industrially, we must make the best use of every drop of water which falls on our soil, or can be extracted from the oceans.”

It should be noted, however, that the country is not “running out of water” in the physical sense. No gigantic drought impends. Over a span of years the supply from the skies remains constant, within a few per cent, of a national average of 30 in. yearly. And of the 30% of this that constitutes the available water supply—that which does not return to the atmosphere at once, but remains within reach long enough for us to make fruitful use of it—we still consume only about 1 gal. out of each 6 or 7, or 200,000,000,000 gal. daily, nation-wide, out of an average daily supply of 1,300,000,000,000 gal.

This article is concerned primarily with the supply of water for consumptive purposes, such as domestic use, or for irrigation and industry. Such functions of water as providing electric power, or for navigation, which in themselves leave it essentially unchanged and fit for consumption, enter into the discussion only secondarily.

Closing of the Water Frontier

Just as the era of free land closed in the United States sometime before 1900, with vast economic, political and social consequences, so sometime after 1900 the American water frontier closed, with consequences which were perhaps as formidable and irreversible as those which followed the closing of the land frontier.

Only recently have most Americans come to realize that their country is faced with problems of water supply. In the early days,

ROSCOE FLEMING is a free lance writer of Denver, Colorado, where he settled in 1936. His strong interest in conserving the nation's natural resources and in problems of western development are reflected in articles which he regularly writes for national and international newspapers and magazines. Mr. Fleming was co-author with Irving P. Krick of the book *Sun, Sea and Sky*, a popular exposition of the forces which determine the earth's weather. Fleming was born in South Dakota in 1895, and studied at the University of Indiana (B.S. 1918).

the wave of immigrants that flowed from the humid climate of western Europe to the similar environment of eastern North America continued as a matter of course to regard water as bountiful and never failing in supply, and they pressed on with scarcely a pause to the humid climate of the Pacific coast. They overleaped on the way that wild, dry hinterland of the west of which Daniel Webster once asked, "What do we want with this region . . . of shifting sands and whirlwinds of dust . . . of great deserts and endless mountain ranges?" But that region is now settled by millions of people. And in the process of that settlement there passed in review, as it were, the lessons the whole nation must now begin to learn—lessons learned by the inhabitants of the arid and subhumid west in the painful working out of a regional code of water law. From this may come eventually a closer national approach to the western system of water regulation, under which rights to water are generally recognized on the basis of "first come, first served" as long as the appropriator puts the water to beneficial use.

In brief, the day has passed when our use of fresh water can be expanded limitlessly. From now on the American community as a whole will be increasingly concerned with the husbanding, development and proper use of the nation's water supply. This presages, whether we may like it or not, an era of increasing governmental activity and supervision.

On every hand—from the housewife, from the farmer, from the industrialist, from officials of the burgeoning cities and suburbs, from conservationists, from government officials—come complaints and overtones of worry about water shortages. To attract prospective industries, many a community now boasts of its constant supply of pure fresh water, something which would have been taken for granted a generation ago. Huge expenditures are being made by many industrial plants to build large new

tanks and reservoirs to store their own water supplies. About one-fourth of all United States communities are chronically short of water and are under some sort of restriction or rationing. Only a minority of cities, such as some of those on the Great Lakes, collectively the earth's largest storage tank of fresh water, are free from worry over water.

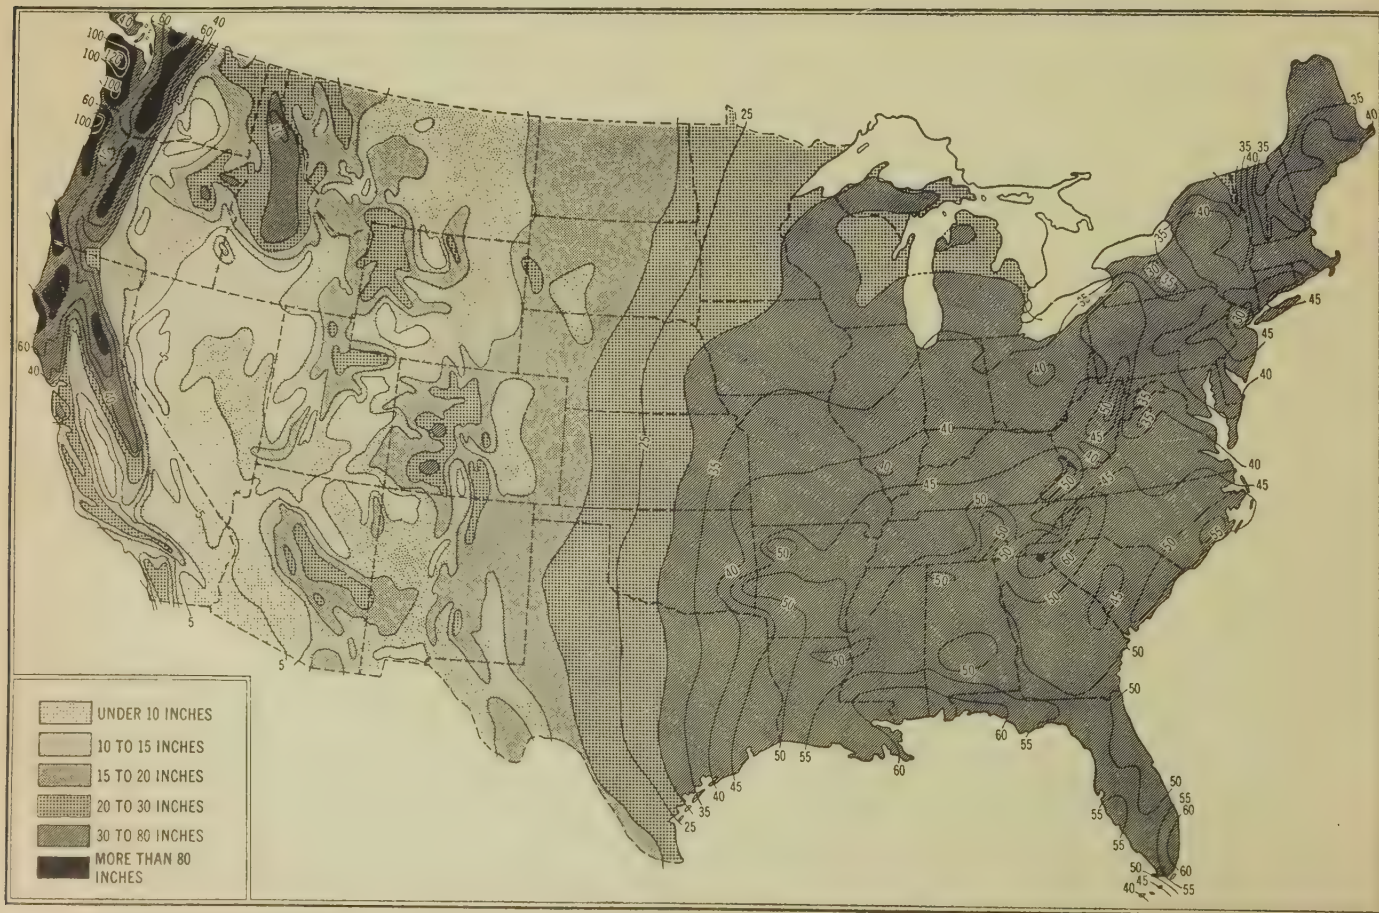

The Amount and Distribution of Precipitation

Yet, as has been said, the country's over-all supply remains roughly constant. Nature lifts from the salt seas, cleanses in her mighty evaporation machine and drops upon the face of the land about 5,000,000,000 ac.-ft. of water yearly, or about 4,300,000,000,000 gal. daily. (An acre-foot is that amount of water which would cover one acre one foot deep, or 325,851 gal. It is so convenient a unit for describing large quantities of water in numbers small enough to be comprehensible that it is used frequently throughout this article.)

Naturally, the supply varies from place to place and from time to time. If all the water that falls on the United States in an average year were to remain exactly where it fell, there would be pools on the northwestern coast more than 11 ft. deep, while at some southwestern points the depth of the water would be only a little more than one inch. East of the 98th meridian, water would lie from 30 to 60 in. deep, while west of that line it would measure from 25 in. down to less than 5 in., except on parts of the Pacific coast.

The country's supply of water is also unevenly distributed in time. In some areas a week without rain is regarded as the beginning of drought, while in others six months to a year without rain is a too-common experience. Most areas of the country experience periods of relative drought and relative plenty. Broadly speaking, the western half of the nation receives about one-third of the rainfall and the eastern half receives two-thirds. From the farming standpoint, the saving grace of midwestern precipitation

AVERAGE ANNUAL PRECIPITATION of the U.S., compiled from U.S. Weather Bureau data

AN ACRE-FOOT: The amount of water required to cover an area of one acre to a depth of one foot

is that a great deal of it falls during the crop season; but even so, the agricultural rule of thumb is that 20 in. or more of rainfall is necessary to produce unaided even the most water-thrifty crops. Hence the interior west is the land of irrigation farming, where water that falls on the mountains is stored in reservoirs and used to supplement natural rainfall.

The west in general is also the land of rivers smaller than their reputations. The Rio Grande, for example, which is so famous in song and story and whose very name means "Great River," actually discharges only about 1% of the flow of the Mississippi, and the Colorado River only about 3%.

This uneven distribution of the yearly precipitation is attributable largely to the location and direction of the two huge atmospheric rivers of water vapour that swirl across the United States: one from the Pacific Ocean, which tends somewhat northeast across the country, and one from the Gulf of Mexico and the Caribbean Sea, which typically streams northward and northeastward across the Gulf and southeastern coast lines and then is bent eastward in the mighty current of the westerlies. This broad picture of the atmospheric circulation accounts for both the well-watered east and the southwestern deserts, which lie in the angle between these two converging rivers of aerial moisture.

Of the 5,000,000,000 ac.-ft. of water that falls each year on the nation, about 70% is snatched back up into the atmosphere by evaporation or by transpiration from plants. From the purely physical standpoint, trees and vegetation are simply so many stationary pumps which pull water from the soil to release it as vapour into the atmosphere. Animals act in the same manner, performing the same functions, but are mobile. This is not a simple, one-time process. Tracer measurements conducted with tritium, the ultrarare isotope of hydrogen, by Willard F. Libby, formerly of The University of Chicago and now of the U.S. Atomic Energy Commission, indicate that some water coming inland over the Pacific coast may have fallen as rain and risen into the air again several times before falling at Chicago.

Man's Use and Abuse of Water and the Land

Of the water that falls, about 30% remains on or under the surface. It collects in rivers and lakes and in the earth's sponge-like crust, which holds more fresh water than all the surface collections combined. This 30% constitutes the supply for man's major use. It is not the drying up of the supply, therefore—save in local situations—that is of so much concern as the inordinate multiplication and expansion of the use of water by man. Not that he began that way. Anthropologists say that man once used water for little other than drinking purposes; from that point his use of it has increased until, in the most complex and luxurious civilization of all time, that of the United States, each person now requires daily on his individual account, though not for direct personal use, an average of about 1,200 gal. or five tons of water, much more than the people of any other country.

The ideal environment for man is a well-watered region between the polar zones of perpetual frost and the tropic zones of no frost. In such an environment human civilizations originated and spread, and in such regions the highest civilizations flourish today. Some specialists, such as Ellsworth Huntington, maintain that human movements and migrations have been dictated by climatic change as much as by the economic, social and political causes to which historians generally attribute them. In any event, among the country's most bitter internal quarrels are those over water, and water disputes furnish much provocation between nations, as today in the middle east.

The efforts of man to make water do his bidding probably began quite early, perhaps with the laying of a line of stones across a brook to guide the water up and over an area planted conveniently nearby. The evolution of that line of stones continued until it culminated in gigantic modern structures such as the Grand Coulee Dam.

Man's efforts to turn water into a "manageable crop" have been distinguished, first, by his dogged determination to cling to an area and seek to improve its water supply rather than to move away; and, second, by the fact that his efforts to coerce nature have often backfired. More than 4,000 years ago the Chinese were spreading water over thousands of acres of plains below their mountains; the Cretans of the same period had flush toilets. Two thousand years ago Roman engineers were bringing to the Imperial City 200,000,000 gal. of water daily, a supply sufficient

for a large modern city, through aqueducts up to 60 mi. long. A thousand miles to the southeast, in that desert now called the Negev, Nabataean engineers were building check dams so skillfully as to provide a whole year's water supply for the people and their crops from a rainfall of only a few inches yearly which fell only during a few weeks in the spring.

Yet the impress of man's mistakes is engraved as deeply upon the face of the land as is that of his constructive achievements. Some 2,300 years ago Plato mourned the eroded desolation of Attica that had resulted from the destruction of its forests and other vegetation. Where the cedars of Lebanon once grew are now rutted hillsides. Much of the spreading desert around the Mediterranean is blamed on man's unthinking destruction of the forests and of other natural covers and binders of the soil surface.

But it is not necessary to go so far back to find a typical history of water use and abuse. Four centuries ago European immigrants began to rush into North America. They found a continent thinly inhabited by man but very little altered or harmed by his use of it, since the people were largely hunters and food gatherers rather than cultivators. The spongy floor of the vast forest that covered the eastern half of the continent was ideally suited to absorb water, filter it and slowly let it down into streams to find its way to the sea. The deep aboriginal sod of the prairies farther west accomplished much the same purpose. The continent was thickly inhabited with burrowing animals, down to the ubiquitous earthworm, and their burrows made channels through which water could percolate down from the surface; the beaver built small storage dams which also held back the water and let it down gradually.

In his headlong exploitation of the continent, man cleared the forests and tore up the sod for agriculture. The farmers made war on the larger wild animals, and the smaller ones were inadvertently destroyed. Overplowing and overgrazing have contributed to the deterioration of the land as a holder of water, and erosion and flash flooding have increased.

Then during our national lifetime more than 115,000,000 ac. of land have been withdrawn from rural uses to be occupied by cities, highway and railroad rights of way, defense establishments, mines, factories, airports, parks, etc. The U.S. Soil Conservation Service has found that this withdrawal is proceeding

even faster than in the past, with about 17,000,000 ac. withdrawn in the past 15 years. Much of this land has been hard-surfaced, which adds to the runoff problem; and some remote areas, such as those used for bombing or artillery ranges, have received even less conservation care than former owners gave them.

Erosion is still robbing the nation of the equivalent of 400,000 to 500,000 ac. of good topsoil annually, despite all soil conservation efforts of recent years. Erosion also increases the disastrous character of floods, particularly as people build more thickly along the watercourses, so that even the catastrophic floods of 1951 in the midwest and of 1955 in the midwest and California may be merely precursors of worse to come.

Erosion also fouls the water supply. Some streams that once ran clear, cool and slow, with relatively little difference between their highest and lowest stages, now boil with flash floods and at other times dwindle to trickles. Further, their water is freighted with mud, hundreds of millions of tons of it going to sea yearly, so that it is said that the Mississippi delta is being built of the farms of 30 states, and that at flood stage the Mis-

ROMAN AQUEDUCT, Segovia, Sp.

souri River carries two farms a minute past St. Louis. Besides representing the loss of rich soil, this silting requires expensive treatment to clear up the water again for human use, and the sediment then fills up the reservoirs that are built at so much expense to store or to control the water.

The Demand for Water Is Increasing

So far we have been able to obtain our water supplies at extremely low cost, simply because water moves itself downhill and we need only to intercept it. Indeed, it acquires so much energy on its way downhill that it can be made to turn water wheels and thus do work, as in generating electricity. Human settlements have been built either beside the moving waters themselves, the immemorial highways, or the waters have been brought to the cities and towns through canals and pipelines. The cost of supplying water to homes and factories can rise rapidly and steeply when it must be pumped uphill or when it must be rid of impurities which are unbearable by human bodies, plants and animals, or, lately, by machinery, which is in some respects the most finicky user of all.

The use of water is increasing much faster in the United States than is the population, as more uses are found for it. The Task Force on Water Resources of the second Commission on Organization of the Executive Branch of the Government (Hoover Commission) estimated that total U.S. consumption approximated 200,000,000,000 gal. daily in 1955, out of the total supply retained on the face of the land of 1,300,000,000,000 gal., and that by 1975 consumption may amount to 400,000,000,000 gal. daily.

The demands of the increasing human population are in themselves formidable. Approximately 170,000,000 Americans have to be supplied with food and drink, about ten pounds daily for each person, which in altered form must be eliminated. Each day there are 11,000 little newcomers squalling their demands for water and for goods which require water for their production; each day therefore sees a net national increase of about 7,500 persons, or enough to populate a typical county seat town.

For each meal set before an American family, at least a ton of water must have been used in growing, processing and preparing it. The quantity of water required for vegetable growth varies from 300 to 700 lb. for each pound of dry product. For example, raising a pound of wheat takes about 500 lb. of water, plus additional water at almost every stage of its con-

version into bread. One pound of sugar requires one ton of water to grow and prepare. Other constituents of our meals require water in varying proportion.

The population of the larger domestic animals—cattle, hogs, sheep and horses—outnumbers the human population in the United States by about 20,000,000, and the domestic animals must also be provided with water. One milk cow, for example, will drink from 60 to 180 lb. of water daily.

Americans scrub themselves more than any other people, use water more lavishly on their lawns and gardens, and in general never stint themselves except in desert communities—though even there may be seen pathetic little plots of land diked by sand in front of the houses, where a few sprigs of grass or a few flowers are nurtured by the patient housewife with waste water carried out by hand.

Not only do Americans take more baths, but they surround themselves with more and more water-using devices: farm ponds,

HOOVER DAM, Colorado River. Completed in 1936, this is the world's highest concrete arch-gravity type dam. It is 726 ft. high and 1,244 ft. long, and its volume is 4,400,000 cu.yd.

THE PROBLEM OF WATER

A SINGLE DROP OF RAIN and the amount of soil it can displace (above), a fundamental lesson in erosion. Left unchecked, the combination of rain, runoff and wind can quickly produce serious upland erosion such as is shown in the photograph below

backyard swimming pools, air coolers and air conditioners, dish-washing machines, home laundries and garbage disposal systems.

Such examples show both the need for increased water supplies and the changing aspects of the problem. The individual well and the backyard privy may still do for an isolated farm or a rough country place, but not for the enormous subdivisions into which the nation's cities and towns are exploding. Each new subdivision requires a central water supply and waste disposal system, which must ultimately be maintained by the community. The same is true with industry. The traditional builder of a factory once dug a well to provide water for it, or hitched onto the community supply pipes; or, locating on a stream, he began to take in its waters for cooling, cleansing or chemical purposes and to discharge them back into the stream at a lower point, often without so much as a by-your-leave, despite his obligation under riparian law to leave the waters unimpaired for the use of others.

But times have changed. The provision of water for a big new industrial plant is now always the subject of serious consultation among its owners and managers and the representatives of the community, and in an increasing number of cases it has become the determining factor in plant locations. Not for nothing is Charleston, S.C., extending as the fairest flower in the bouquet with which it seeks to attract northern industry its feat in diking off, close beside the sea, a fresh-water supply of 10,000,000 gal. daily!

And water has also become an important factor in government planning; for example, water supply or water power, or both, have determined the location of almost all the plants of the U.S. Atomic Energy Commission.

Water has on the whole remained so cheap as to spoil us. The average purchaser of a domestic water supply, country-wide, pays about five cents a ton, or one cent for 48 gal., and in some cities the cost is much lower. For example, in one large western

DUST STORM approaching Springfield, Colo., in the 1930s. A widespread program of careful cultivation might largely have prevented this carrying of Colorado topsoil hundreds of miles from the eroded fields

city, Denver, Colo., the householder can fill and empty the standard 30-gal. hot water tank in his cellar three times for a penny. Yet the water has been brought into his house through a gathering system which extends more than 100 mi. into the mountains and pierces the continental divide through a 6-mi. tunnel; it includes four large artificial mountain lakes, a purification plant, scores of miles of large mains and hundreds of miles of smaller ones. The capital value of this plant is \$85,000,000, its annual budget is \$11,000,000, and it employs about 700 persons directly, in addition to those employed by contractors on work they do for it. By any standard it is one of the larger industrial enterprises of its community.

This city, which is located on what was formerly a dry prairie, is perhaps a more lavish user of water than most. Its people use water unstintingly to keep alive their parks and trees, their gardens and lawns. Its total requirements are larger than those of a humid-region city, and average about one acre-foot per year per family; but that family gets all its domestic requirements at a total cost of \$30 to \$70 per year. Except during long droughts, there has historically been no rationing of water, but this idyllic situation is ending there as in hundreds of other communities throughout the nation, many in regions of more plentiful natural water supply.

In fact, the business of supplying potable water to a big city is so elaborate a process that the finished product might almost be said to be manufactured. For example, Minneapolis, Minn., gets its water from the Mississippi River, and the city's water supply engineers annually use 6,000,000 lb. of alum to remove colour and materials that will not dissolve, 18,000,000 lb. of lime to soften the water, 2,500,000 lb. of carbon dioxide to keep it soft, 700,000 lb. of chlorine to kill bacteria, 500,000 lb. of ammonium sulphate to keep the water pure until it reaches the household faucet, and 500,000 lb. of carbon to control taste and odour.

The Cost of Water

Considered as an industry in itself, the supplying of water throughout the United States was estimated even by 1950 to represent a capital investment of at least \$50,000,000,000 and an annual expenditure of more than \$3,000,000,000. The prospect is that both figures will at least double by 1975.

The cost of supplying water is rising rapidly partly because it has to be brought from farther away, as the nearer sources become overtaxed, and partly because the water supply has been

permitted to become contaminated, as in the case of numerous towns and cities which turn their untreated or only partially treated sewage into streams. This in turn compels downstream communities to install expensive treatment plants to make the water fit for drinking.

Estimates of the cost of water ignore very large amounts of money which are spent essentially on water but that are not reckoned as such. For example, the national forests have become increasingly valuable as sources of water for cities and farms which lie below them. One expert has estimated that more than 80% of the annual revenue value of the western forests now lies in their use as watersheds, as compared with that for timber production, grazing and recreation, all lumped together. This water value is rising steeply, too, as population rushes into the west. Another estimate is that even the barest boulder-strewn mountain-top in the Rockies is now worth \$50 or more an acre as a gatherer of water, or much more than unwatered prairie land

STREAM CONTROL AND FLOOD PROTECTION. Before and after views of a U.S. army corps of engineers project on a stream serving Cumberland, Md., and Ridgeley, W.Va. Stream bank erosion, threatening the railroad on the left and the buildings on the right, was eliminated

at the base of the mountains. Each acre above timber line yields an average of one acre-foot of water yearly. Yet expenditures of the U.S. Forest Service are not computed as for water supply.

In industry, many large corporations now have budgets for water supply alone that are comparable with the water budget of the city of Denver, both to ensure themselves of pure water and in many cases to make sure that their waste water does not pollute the community supply. Such private expenditures are increasing. Yet they are hidden in corporation accounts and do not figure in any public reckoning of the cost of water.

Industry the Biggest User

Most persons are accustomed to think of water only in terms of their direct personal use of it. But the vastly greater use of water is in ways that are out of sight of most persons and of which they do not often think. For example, Jack R. Barnes, formerly of the U.S. Geological Survey, estimated for the President's Materials Policy Commission of 1952 (the Paley Commission) that people were then directly using 17,000,000,000 gal. daily and would use 25,000,000,000 gal. daily by 1975. Yet in 1950 industry was estimated to consume 80,000,000,000 gal. daily, and irrigation was consuming 88,000,000,000 gal. daily of the national total daily consumption of about 200,000,000,000 gal. Direct domestic consumption was therefore less than one-tenth the total. By 1975, in Barnes's projection, industry would require 215,000,000,000 gal. daily and irrigation 110,000,000,000 gal., so that the daily domestic requirement of 25,000,000,000 gal. would then be only 7% of the total.

The most steeply rising curve of water use is by industry, particularly the chemically based industries, such as oil refining and the manufacture of synthetic materials such as plastics, rayon, nylon and the like. Papermaking alone consumed about 3,200,000,000 gal. daily in 1950 and 3,800,000,000 gal. daily in 1954. About 300 lb. of water goes into the making of a newspaper that weighs 1 lb., and in the process much of this water is polluted beyond immediate human use. Water is the most widely used industrial chemical. It serves as a raw material, a heat exchanger, a catalyst, a solvent, a binder. It must be available whenever and wherever needed and in condition suitable for use. Previously, and especially in the humid regions, industries needed to give little thought to the water supply; it was almost always adequate. Now the supply of water is often the foremost consideration. The

National Association of Manufacturers lays emphasis on its importance: "A shortage of water for industrial purposes—just as surely as a shortage of capital—could defeat our hopes for future growth and prosperity, and even imperil our national safety. No industry or business can long survive where water is unavailable or inadequate as to quantity or quality." And Barnes says that industry has an ever-increasing claim on water, as contrasted for example with the claim of agriculture; *i.e.*, a gallon of water used in industry is more valuable employed than a gallon of water used in agriculture.

Each new type of industry seems to require greater quantities of water. The oil industry, largest in the country, requires tremendous amounts at every stage, from the oil well through the refinery to the automobile service station. When the liquid oil reserves of the country begin to fail and it becomes necessary to hydrogenize coal or distill oil from shale, these processes will require still more water. It is estimated, for example, that to establish a major extraction industry on the trillion-barrel shale reserves of the Rockies will require 300,000 ac.-ft. of water yearly. And any plans for turning coal into gasoline would also require locations where large fresh-water supplies are available.

Some new water-using industries are so far out of public sight that the public scarcely knows they exist. In the late 19th century a miner's wife in Australia noticed that flecks of galena and other ores clung to the bubbles of the suds in which she washed her husband's dirty work clothing. From this observation sprang the process known as froth flotation. Finely ground ores, or other substances, are channelled through huge washtubs in which small amounts of various chemicals are mixed with the continuously agitated water. The minerals to be removed or recovered cling to bubbles, which rise to the surface and are skimmed over the side. The process is now used to recover almost all nonferrous metals, and the drain on local water supplies is heavy. It is also used to prepare wheat for milling, to cleanse sesame seed and other farm products, to redeem coal dust for fuel, to reclaim used paper and for scores of similar purposes. The process can be reversed to cleanse polluted water and is being increasingly used for that purpose.

Water drafts are increasing in other ways. The fast-growing air-conditioning and air-cooling industry is largely based on the use of water. Much summer municipal consumption, particularly in the hotter parts of the U.S., is for this purpose.

Most Uses Speed Evaporation

Most uses of water are of a nature to increase evaporation. Evaporation is part of the inevitable penalty of storage. Even in the cooler parts of the country the evaporation from an exposed water surface runs from 30 to 36 in. yearly; in the hot, dry southwest it may run up to 100 in. or more. When water is allowed to stand in large shallow pools—and in cross section all pools are

DAILY WATER CONSUMPTION IN THE U.S. (In billions of gallons) in the 1950s, and the estimated figures for 1975

GALLONS OF WATER required to perform a variety of industrial services

Make a ton of synthetic rubber	600,000
Brew a barrel of beer	470
Produce a ton of aluminum	320,000
Make a ton of smokeless powder	50,000
Can a case of lima beans	250
Generate a kilowatt-hour of electricity	6,000
Test an aeroplane engine	50,000
Produce a ton of bromine	5,000,000
Refine a barrel of petroleum	770
Make a ton of steel	65,000
Produce a ton of coke from coal	3,600
Make a ton of viscose rayon	200,000

METROPOLITAN WATER SUPPLIES

The photographs on this page illustrate some of the steps in the collection and purification of water to be used for direct human consumption in cities. In general these are the conditions for areas which depend directly upon rainwater—and runoff—as the supply source. For a slightly different situation, in which the city supply is derived by purification of river water, see page 18

Right: Typical mountain watershed, the Cedar River valley, Washington, source of the Seattle water supply. To prevent deterioration of their watersheds, cities maintain them by replanting trees and practising other conservation measures which preserve the terrain and control runoff

Below: Primary storage reservoir, a natural lake artificially diked by gravel shores, with a capacity of 3,660,000,000 gal. Storage reservoirs serve to collect runoff when precipitation is above normal (spring and fall) and maintain an even flow of water to other installations downstream throughout the year

Above: Aeration plant of the Ashokan reservoir, a major basin of the New York city supply. Water leaving the storage lakes receives here its first purification

Above: Additional cleansing takes place as the water approaches the city. Shown here is a view of the filtration galleries of the water system of Baltimore, Md. Insoluble products are removed as the water passes through sand, gravel and other screening materials

Left: Final sterilization of the water is usually accomplished through the addition of chemicals, chiefly chlorine. Machines such as those shown regulate the chlorination and indicate the degree of purity of the treated water

Right: Purified water is then pumped directly into the city mains or stored until needed in covered reservoirs or gravity pressure tanks like the one shown here

shallow—it is simply an invitation to the sun and atmosphere to come and get it. From the 160 sq.mi. of Lake Mead, for example, an estimated 800,000 ac.-ft. of water is lost yearly as vapour. This is not an argument against storage, for before Lake Mead was created the same amount of water now lost to the sky in a year would have run to waste in the Gulf of California in three weeks. But increasing evaporation is indubitably part of the price of storage. In all the projects of the Bureau of Reclamation the yearly loss to the atmosphere is estimated at about 2,000,000 ac.-ft., enough to irrigate up to 1,000,000 ac. of land, or to provide a domestic supply for a city larger than New York.

All over the United States, the needs of the people and the conservation policies of the government have created pools in increasing numbers—convenient evaporation tanks, in nature's view. The number of farm ponds, small irrigation reservoirs and small dams in watersheds, created with Soil Conservation Service assistance, totalled about 800,000 in 1956. Private ponds, and lakes created by and for other federal and governmental units, brought the grand total to 1,000,000 or more. At the end of 1956 there were an estimated 60,000 residential and community swimming pools, and others were being built at the rate of 30,000 yearly.

In short, there is no material aspect of American life, domestic, agricultural, industrial or commercial, that is not based upon storing and drawing larger and larger supplies of fresh water for increasingly larger and more diverse uses. However, all consumptive usage today amounts to only a little more than 1 in. of the 30 in. which nature bestows on the nation in an average year, or about 15% of the 1,300,000,000,000 gal. daily that remains long enough for man to use.

More Effective Management Needed

There are definite limits upon the annual amount of water which can effectively be converted to the use of man; upon the size of the "manageable water crop" which can be harvested even by the most enlightened management and by new techniques only now coming into sight. Yet such management can greatly increase the available supply, and according to J. R. Mahoney, senior natural resources technician for the Library of Congress:

A national program for increasing the quantity and improving the quality of products vital to human welfare can be achieved more effectively through water-management than by any other method. The undeveloped potentials are probably greater than for all other resources combined.

Waste Not, Want Not

The population of the United States is increasing its demands upon the available water supply at a rate greater than the population increase, but partly because of waste rather than of legitimate need. A chief cause of waste is pollution, since most of the water is either dirtied inadvertently or is deliberately used to dilute, dissolve and carry away impurities. If it were possible to clean up all the water so polluted, or to refrain from polluting it in the first place, most parts of the United States would be able to tap a larger "new" supply of pure water by this than by any other means.

First, there is waste due to siltation, which is in turn largely caused by past extravagant misuse of the soil. Such misuse is by no means ended, though it seems to be slowly diminishing as a result of wiser and thriftier policies of soil conservation. Siltation is one of the easier types of pollution to correct, since the particles will settle out if the water is held still long enough, unlike pollutants that dissolve in water and cannot be removed by gravity.

Then, in a fashion as free and easy as his misuse of the soil, man has got rid of waste, organic or industrial, by dumping it into the watercourses upon which he also depends for fresh water. This abuse has grown until public health authorities now characterize some of the major rivers as "sewers a thousand miles long."

Organic Pollution

So far as organic wastes are concerned, largely sewage, the national picture shows that there are 16,000 community water supply systems but only about 9,000 sewage disposal systems. This means that there are 7,000 communities of some size which have no sewage disposal or purification facilities whatsoever, beyond dumping the raw wastes into the community stream, well below town, of course, but above other communities which draw their drinking water from the same stream. The lower community usually complains of the pollution coming down the river, but often only adds the burden of its own refuse, and the process is repeated down the length of the stream. Further, of the sewage treatment plants that have been installed, many were inadequate to begin with, or have become so overloaded as the result of

RAW SEWAGE ENTERING A STREAM, posing a health problem for downstream communities

BIOLOGISTS SEINING A POOL to collect fish and smaller organisms in a U.S. Public Health Service project to determine the kinds of life which can exist in the three zones—septic, recovery and clean—of a contaminated stream

increasing populations that their contribution to the stream is little better than raw sewage.

The comfortable assertion with which communities sometimes salve their collective consciences rather than spend money on adequate sewage purification is that "running water purifies itself." It may do so in the course of many miles, when the burden of pollution is not overwhelming. But this is not true where a stream is overloaded with organic and chemical wastes, whether human, animal, industrial or those carried down with topsoil. Indispensable for aquatic animal life is the oxygen dissolved in the water—not the "O" of H_2O , but the elemental oxygen itself interspersed throughout the water. Decay of organic material is, however, an oxidizing process; that is, one of combination with oxygen. When a large quantity of sewage or other organic wastes is dumped into a stream it robs the water of its dissolved oxygen, perhaps for many miles, and fish and other aquatic animals are asphyxiated. All such life vanishes from the body of the stream. If this process is repeated at intervals along its course by successive use of the stream as a community sewer, it will eventually kill the whole living river.

One sad example of organic pollution is the Potomac River, around and below the nation's capital. Where fresh water meets incoming salt water and is slowed up, the former tends to drop its load. Health authorities discovered that the Potomac is so overloaded, largely with human wastes, that its estuary around Washington, D.C., is carpeted with such wastes over a large area to a depth of several feet. They are simply accumulating there, unchanged and uncleansed. Nothing can be done about this except to stop the pollution, which would require huge capital expenditures.

The plight of some inland cities is if anything worse. When the Ohio River is flowing at minimum stage, it is said that one quart of every gallon of water flowing through the faucets of Cincinnati has been through someone's toilet or kitchen sink upstream, or

through a mine dump or industrial plant. According to the U.S. Geological Survey, the present surface water withdrawals in the Ohio River basin at times of minimum flow of the river are greater than that flow.

Such a water supply is naturally loaded with bacilli of many varieties. Although it can be rendered safe by chlorination, the fact remains that the city is put to extra expense to purify its water supply of the filth and dirt deposited by cities above; and this is repeated until the city farthest downstream gets the accumulated detritus of all those above it.

Nonorganic Pollution

A second cause of stream pollution is the dumping of industrial wastes, which may contain active poisons such as acids, alkalies, sulphur compounds, cyanide compounds, etc. The steel industry uses huge quantities of "pickling liquor," which is sulphuric acid, to eat the scale off newly rolled steel shapes. Formerly, after this became diluted and full of iron oxides, it was dumped into the nearest stream. Now, however, many steel mills reclaim this sulphuric acid and so have reduced pollution.

In mining areas the pollution may be compounded by waste water from the mines themselves, by runoff from their dumps and by waste from ore treatment plants. In some mining communities the floors of streams are covered for many miles with coal dust. In nonferrous mining, where ores must be ground as fine as talcum powder, these fine "tailings" formerly were dumped into the streams, where they not only killed aquatic life

KILLED VEGETATION resulting from brine which escaped from an oil well in Michigan

but also floated downstream and killed grassland and farm land by tightly sealing the surface of the soil. Protests from fishermen and farmers have largely ended such practices. Gold dredges have ruined many fine western valleys and streams. These machines simply turned the valley floor upside down, leaving it in windrows of boulders. Most such dredges are now inactive, however. Strip mining, as for coal, used to ruin many square miles of land, but most strip-mining companies now practise various methods for recovering the land.

A case history of the causes and effects of stream pollution is afforded by a recent study made on behalf of a western city of 16,000 persons, located upon a tributary of the Missouri River. An investigator discovered the following sources of pollution: A railroad tie-treating plant dumping carbolic acid wastes into the river; a railroad roundhouse dumping greasy and highly alkaline wastes; the state college stock farm dumping the untreated sewage of hundreds of animals; the overloaded local sewage plant dumping its product only partly treated; and many residences disposing of untreated sewage directly into the river. State game inspectors could find no fish in 50 mi. of the river below the town. All that is needed to round out the picture is a slaughterhouse and a vegetable-packing plant. It may seem incongruous to the housewife that fresh vegetable waste, such as she discards daily, or fresh animal offal, such as a packing plant must dispose of, are greater sources of water pollution, pound for pound, than is sewage. But the latter is already partly decomposed or oxidized, and therefore makes a lesser draft upon the free oxygen in the stream, while oxidation must proceed from the beginning in the case of fresher and less offensive wastes. Several cities have adopted new quick-composting processes which, with the aid of cultures of extraordinarily efficient bacteria, reduce garbage to usable topsoil within a few days, and thus relieve to some extent the pollution load.

New types of pollutants are constantly appearing. Sprays and insecticides of a deadliness unknown a decade ago are used by the farmer to fight pests. But many such sprays are definitely toxic to human beings as well as to the pests, and the effect of others is as yet unknown. The U.S. Food and Drug Administration consequently insists on thorough cleansing of fresh fruit and vegetables in interstate commerce, and state and local authorities follow up the precaution—but the wash water runs off into the community disposal system. Detergents, now used in greater quantity

CANAL DIVERSION PROJECT under construction in Florida. Completed control structure would permit regulation of floodwaters from the interior and prevent the intrusion of salt water from the Atlantic ocean

INDUSTRIAL POLLUTION CONTROL, a view of the water-treatment facilities of the River Rouge, Mich., plant of the Ford Motor company. Waste water from manufacturing enters at the right; before the water joins the main stream of the river the structure at left skims off the surface oil and screens out other insoluble products

than soap, sometimes make waste water foam as high as a man's head at turbulent spots on a stream below a city. New chemicals are continuously being introduced in industry, and these complicate the disposal problem. Some communities, in lieu of building expensive sewage treatment plants, simply acquire or build large ponds into which the sewage is run for oxidation before it enters the stream. Such ponds do oxidize it if not overloaded, but people downwind complain strenuously of the stench.

Heat may become a problem, altering and usually impoverishing the biological fitness of a river. The Hanford works of the Atomic Energy Commission at Hanford, Wash., for example, cast off enough heat to raise the temperature of the whole mighty Columbia River by one degree; and the waters of the Merrimac River in New England, bordered for many miles by industrial plants on both sides, get as hot as 110° F. during the summer.

Then there is the wholly new problem of atomic wastes so deadly to life that they must be carefully screened out and buried. At Hanford the Atomic Energy Commission has incongruously become a salmon tender and a shepherd, for it watches the effects upon these animals of effluent cooling water from the plant, to detect any possible leak of radioactive material into the river or into underground water supplies.

Redeeming Water

Even with all such considerations, however, most waste water is still less heavily laden with pollution, and thus more easily reclaimable, than is sea water, with its 3.5% burden of minerals. So the first and most obvious way to provide more usable water in many parts of the United States—apart from not polluting it in the first place—is to reclaim the waters that are laden with topsoil, those polluted by the sewage of cities and those carrying the wastes of factory installations.

If an appreciable fraction of the 200,000,000,000 gal. of water consumed daily in the United States could be reclaimed, it would also go far toward solving the immediate water problems of at least some communities. In the ideal situation each community, or each industrial installation, would take care of its own wastes and would release the water for the next user as clean and sweet as when it fell from the skies or flowed in clear mountain streams. If each city reclaimed its own waste water and recirculated it, its water supply problem would be limited to replacing the amount lost into the ground or through evaporation. But for

some reason Americans have a distaste for reusing their own waste water, so that this solution has to the writer's knowledge not been adopted by any water supply system in the country. This distaste apparently does not extend to reuse of the waste water of the next community upstream, or some Americans would become very thirsty.

The ideal of clearing all pollution at the source would be very expensive. The Task Force on Water Resources of the second Hoover Commission estimated that U.S. cities spent an average of \$145,000,000 yearly on sewage treatment plants for the four years 1950-53 inclusive; it added that no means were available of estimating the expenditures of industry for this purpose. As of 1955 the U.S. Public Health Service estimated that, merely to keep pace with increasing pollution, the nation's cities would have to spend an average of more than \$500,000,000 yearly for the succeeding ten years. In Aug. 1956 it was announced that New York city alone planned to spend \$225,000,000 in an endeavour to rid all its surrounding waters of pollution by 1964. The use of waste water as a new source of water supply, rather than letting it run down to the sea and be lost, depends largely therefore on the willingness of the taxpayer to pay the bill. The amended water pollution act passed by congress in 1956 authorized the federal government to grant 30% of the cost of approved local projects to abate pollution, but not more than \$250,000 to any one such project.

It also outlined procedures by which the U.S. Surgeon-General may proceed to abate continued pollution.

Saving Water

One obvious opportunity for saving water is before the point of use. Man's rivals for water are on the job every minute, striving to rob him of it. This begins even before it reaches the ground. Raindrops descending from the clouds into warmer, dryer air may evaporate at such a rate that they never reach the ground. "Virga," or rain that trails from a cloud but never reaches the land, is a common sight in dry regions, and a discouraging one. Once the water is on the ground, sun and atmosphere snatch at it greedily. Often this occurs while it is still in the form of snow. It sublimates, changing directly from the frozen to vapour form, without going through a liquid phase. The warm chinook winds of spring may take billions of tons of snow from the soil surface or directly from the branches of millions of acres of evergreen trees which have held it above the ground.

Once the water reaches the ground, useless plants may drink it. It is estimated that about half the water in the big irrigation reservoirs never reaches the roots of the farmer's plants, because of evaporation, seepage from the canals or ditches and the fierce thirst of water-loving vegetation useless to man. The proportion of loss may be less for domestic water, since its value is greater and community supply systems can afford to guard it better, but there is still loss.

Selective Cutting of Forest Trees

Most progress in water saving has naturally enough been made in dry regions. The U.S. Bureau of Reclamation and the U.S. Forest Service have devoted much attention to saving water. One of the programs of the latter agency, experimental so far but of great promise, tackles the problem of saving water from sublimating into the atmosphere while it is still in the form of snow. Deciduous trees shed their leaves and allow snow to reach the ground, but much of the evergreen forest of the Rockies is so thick that it forms a virtual roof over the earth. Upon this roof may lie as much as two feet of snow, much of which never reaches the ground but vanishes back into the atmosphere when the warm winds come.

At Fraser, Colo., high in the Rocky Mountains, the staff of the

STRIP CUTTING of a mountain forest near Fraser, Colo., a water-saving project of the U.S. Forest Service. The cleared areas permit snow to reach the ground which would otherwise remain on the trees until spring and then be returned by sublimation to the atmosphere, unavailable as water. The standing trees also cast enough shade to prevent evaporation losses in the spring, when the snow is melting and running off the slopes

U.S. Forest Service's Rocky Mountain Forest and Range Experiment Station of Fort Collins, Colo., has conducted a decade of experiments in selective cutting of the forest in various patterns to increase the proportion of snow that reaches the ground. The snow melts, thereby increasing the runoff. This selective cutting has two purposes: to open a space between the trees for the snow to fall into, yet to retain enough trees to shade the snow and prevent it from melting too early. The most efficient patterns for the purpose appear to be those which take out the trees in blocks or rows about as wide as the trees are tall.

Runoff has been increased by such means as much as 29%, which means an increased yield of at least several acre-inches from each acre. "Crop forestry," or selective cutting of mature trees, also increases the amount of snow which reaches the ground. But until water becomes more valuable, most of these techniques are too expensive to be practised for the sake of the water itself.

LINING A CANAL with asphalt or concrete is a method of saving water by preventing seepage. The photograph shows gravel being spread on asphalt membrane during lining of the Casper canal, Wyoming

Lining Reservoirs and Canals

Much work has also been done in lining reservoirs, canals and ditches with watertight materials. Every householder is familiar with the way that water-seeking roots can choke off a water line and every transcontinental air passenger with the way his eye can trace the green fringe of vegetation of a watercourse clear to the horizon. So the aim is to line ditches tightly enough to prevent

WATER-WASTING PLANTS (phreatophytes) covering thousands of acres of the valley of the Rio Grande in southern New Mexico. In the centre is a section of a channel which when completed would confine the river and reduce the loss of water to the useless plants

water from seeping out and to prevent invasion by the roots of water-loving plants. Big long-distance canals are lined with concrete as a matter of course. On smaller canals a variety of linings is used—asphalt sprayed on the bottom and sides, allowed to harden, then covered with soil; watertight membranes; or very fine or colloidal clays floated downstream to settle and fill up pores and crevices in bottom and sides, a method which is comparatively inexpensive. In other instances, sides and bottom of the ditch are simply compacted by pounding, then covered with gravel to avert washing. Leakage is especially serious and hard to stop where a ditch or canal runs across a stretch of sand and gravel or of fractured rock, such as the surface of an underground storage basin. Sometimes canals are lined along such stretches only, when lining throughout their length would be too expensive.

Fighting Undesirable Water-Consuming Plants

Phreatophytes, a name given to water-loving plants that are useless to man, present a special problem. Such plants are so efficient at pumping water into the atmosphere that, where they cover the surface thickly, the loss of water may be as great as that from a water surface under a hot sun. Aquatic plants often invade a canal itself, and these must be combated with special care, since what will kill them may, if carried into the field or the reservoir, destroy crops or affect the health of people or animals. Aromatic chemicals, which do their work and then evaporate, are used for this purpose.

But the water-loving plants that root in saturated soil are even more formidable foes than those plants that invade the canals. In the dry southwest, well levels often fluctuate up by night and down by day, in rhythm with the water-using activities of nearby phreatophytes. The U.S. Geological Survey estimates that in the 17 western states such plants may transpire nearly 17,000,000 ac.-ft. of water yearly into the atmosphere from 11,000,000 ac. This is enough water to grow 7,000,000 to 8,000,000 ac. of useful crops, or to supply the entire water needs of many millions of persons.

One of the penalties of storing water is that, as the water slows up at the head of a reservoir and drops its load of silt, it builds up a delta of saturated soil—where phreatophytes promptly es-

tablish themselves and pump the water into the sky. If such plants are destroyed, however, the water will evaporate just about as fast. So the remedy is to canalize—that is, to confine the water to one narrow channel—and, since the penalty of evaporation is inevitable, to pay it in growing useful plants rather than useless ones. It is almost impossible to get rid of phreatophytes by any means other than denying them water. Sprayed, cut or burned, they come back strongly if the soaked subsoil continues to carry the moisture to nourish their roots.

Along the middle Rio Grande above the Elephant Butte Dam built in 1916, many thousand acres of land, virtually the entire flood plain, had become waterlogged. In 1951 the Bureau of Reclamation began canalizing the river to cut down on the resultant water loss. By the end of 1956 the program had saved 165,000 ac.-ft. of water in all, and a project to dike another 12 mi. of river promised to save another 45,000 ac.-ft. annually. This is enormously worthwhile in a land as perpetually starved for water as the Rio Grande valley.

Methods of Preventing Evaporation

The ideal way to carry water would be through pipelines and tunnels, impervious alike to seepage, to plant and animal invasion and to evaporation. Some day the land may indeed be interlaced with pipelines carrying water, as it is now with long-distance gas and oil lines. Some bold innovators even talk of transporting fresh water long distances by pipeline below the sea, as from water-plentiful northern California to water-short southern California, or overland from the Great Lakes to Kansas or Oklahoma. Indeed, there are now water tunnels as long as 25 mi. which move water by gravity through mountain ranges, thus avoiding the immense cost of pumping it up and over.

Surface-Film Method

When it comes to preventing evaporation, however, much simpler and less expensive ways are being explored than to cover the water with stone or metal. Certain chemicals, the types that will spread over the surface of the water in layers only one molecule thick, are amazingly effective in preventing evaporation. The commonest example may be seen in the rainbow glint of oil re-

ALUMINUM-COVERED MUNICIPAL RESERVOIR at Santa Ana, Calif. Designed to reduce operating and maintenance costs, the corrugated aluminum cover eliminates evaporation losses and keeps the water clean

"TRASH PLOWING," a method of dry-land cultivation that loosens the soil sufficiently for planting while disturbing the surface only slightly. The "trash" then serves as a mulch to retain moisture in the soil after planting

flected from the surface of a puddle.

The process of evaporation takes place when water molecules at the surface one by one absorb so much heat energy, as from the sun, that they move faster and faster and finally get up flying speed, as it were, and take off. Now if an impervious curtain could be laid upon the water—for example, a sheet of one of the new transparent plastics—these active molecules would exhaust their energies in battering against its undersurface, without being able to break through. The chemical surface film acts in precisely this way, and the amazing thing is the amount of resistance that such a film can put up when it is only one molecule thick, or about one ten-millionth of an inch.

At two points in the United States, elaborate experimentation is going forward to find the chemical best suited to this purpose, yet harmless to users of the water, either plant or animal. This technique has not as yet been introduced on water supply reservoirs and will not be until health authorities are completely satisfied that it is harmless. But it promises more water saving, at less cost, than any other under investigation. From the Dallas watershed alone, evaporation loss is estimated at 35,000 to 45,000 ac.-ft. yearly.

One research project is going forward at Lake Hefner, near Oklahoma City, the scene of earlier elaborate evaporation studies by the U.S. Geological Survey in co-operation with the Bureau of Reclamation. These agencies, together with the U.S. Public Health Service, the state of Oklahoma and the city of Oklahoma City, are partners in the new enterprise. The other research project, financed by private capital, is at the Southwest Research Institute at San Antonio, Tex. There research workers have set up what they call a "fur-lined bathtub" which contains a series of battery cells, each open at the top, each in its own compartment, each kept automatically filled with water and each supplied with its own variety of water-filming chemical. Automatic devices record the amount of evaporation from each cell and thus measure the relative efficiency of the various chemicals which are being tested.

One of the most efficient of these water-coating films is hexadecanol, a material used in cosmetics. W. W. Mansfield, research scientist of the Australian government, reported his experiments with it to an evaporation institute held in 1956 at San Antonio. He had covered a 320-ac. lake with 2.2 lb. of hexadecanol. It spreads itself, as do all these surface-covering chemicals. Placed in small floating boxes with gauze windows open to the water surface, it feeds out molecule by molecule, the molecules clinging together so as to keep intact the surface layer, until the whole surface is covered or until the substance is exhausted. Waves do not part it, and it recoalesces immediately after the water surface is broken by an object, be it a small one like a raindrop or a large one like a motorboat.

Mansfield calculated that his invisible coating, only one ten-millionth of an inch thick, saved 45%, or nearly half, of the water that would otherwise have evaporated from the lake. It cost about 50 cents a pound, so the water saving on the 320-ac. surface was accomplished at a total cost of \$1.10 for material. If this saving were even as much as one vertical inch of water for the period, it would have totalled about 27 ac.-ft. or nearly 9,000,000 gal. of water, at a cost for materials of about four cents an acre-foot.

If the technique is as efficient as such research indicates, and harmless to health of man, animals or vegetation, it offers the

possibility of huge water savings, since 30 in. are lost to the atmosphere yearly from an exposed water surface, even in relatively cool and humid climates. A drop of water in a reservoir is worth many in the clouds. For example, consider the 800,000 ac.-ft. which yearly evaporate from the surface of Lake Mead. Once risen into the sky it is gone forever, except for that small fraction which may fall again as rain or snow and remain upon the surface. And even if it all fell again at once, it would make a shower of only about one-sixth of an inch over an area the size of the state of Colorado. Yet where it is available from the storage reservoir, it is a treasure. One-half of it, or 400,000 ac.-ft., would be enough to irrigate 200,000 ac. of land or to supply with domestic water a city the size of Los Angeles. If water savings of this order can be made at costs as low as the experiments indicate, the surface film technique may become important in attempts to save the increasingly precious supply of water.

Mulching the Surface

Every home gardener knows how much more moist the soil surface stays beneath a covering of grass clippings or leaves. Farmers, particularly in the drier parts of the United States, have learned much about the water-conserving efficiency of a mulch covering the surface. Dry-land farmers plow with the aid of special equipment which "leaves the trash on top" and the surface largely undisturbed, yet loosens the underneath soil to encourage the entry of rain from the top and to break the capillary train which brings water up from beneath toward the drying surface. By such means crops can be raised on amounts of water that seem unbelievably small to humid-region farmers. Dry-land farmers also practise fallowing, which means leaving the soil idle in alternate seasons. They cultivate it sufficiently, however, to keep it loosened up and to destroy water-robbing weeds and grind them into the surface, which also helps to clothe it against evaporation.

Dew Nourishment

Another technique for establishing dry-climate agriculture, only lately being intensively studied, employs dew nourishment. Plant circulation is reversed at night; that is, water which falls upon the leaves as rain or gathers there as dew is absorbed and passed into the body of the plant; and, if there is a surplus, it may be stored in the soil by the root tips.

The Israeli, struggling with the problem of making their southern desert produce crops, have studied dew agriculture most intensively. In the United States, research has been carried on by F. W. Went, of the California Institute of Technology, and others. The promise of the process lies in the extraordinary efficiency with which plants utilize dew. In regions where dew is heaviest, it can apparently take the place during the growing season of five to ten inches of rain or irrigation water. So a very fine spray of water applied on dewless nights apparently can have the effect of several times as much applied during the hot day, either by spraying or through ditches. This means that a few inches of simulated dew might accomplish as much growth during a crop year as two feet or more of irrigation water. Some specialty crops in California apparently ripen their fruit on dew alone, during the rainless season. But Went warns that smog defeats the formation of dew on the ground, since the dew forms on the particles of smog which continue to float in the lower air.

Utilizing Water-Saving Plants and Animals

Another way to stretch nature's bounty in a dry climate is to find and cultivate useful plants that require only a small amount of water. The Israeli, again, have taken the lead in these investigations. Such plants are very tough and able to stand the repeated wilting and freshening, the stretching and contracting, that ruin

SAVING WATER WITH CHEMICALS. Normal process of evaporation is shown at left; the heat of the sun sets molecules in motion with the eventual escape of some as vapour. With the spreading of a chemical film on the surface, the water molecules are unable to break through the cohesion of the chemical molecules

INVESTIGATION OF THE SNOW PACK. Left, team has driven hollow tube into drift to determine depth of the snow; right, snow-packed tube is weighed to gauge the water content of the snow

lusher types of plants when they are subject to a capricious water supply. Desert plants consequently do not make good eating, though they are useful for other purposes. One promising dry-land variety is the grain sorghums, now widely cultivated in the Great Plains of the United States because of their ability to deliver a crop under conditions so dry as to mean failure for other crops, even wheat.

Still another way to make a dry climate productive is to raise animals which nature has evolved to survive in such conditions. The camel, although not indigenous to the United States, is a striking example. It is "air-cooled"; *i.e.*, its nighttime body temperature of 93° F. will go up to 105° F. before it begins to sweat, even slightly. The camel's faeces are almost dry, and it eliminates less than a pint of water daily. Its body is apparently capable of making some of its own water by combining oxygen from the air with the hydrogen of the carbohydrates it eats. Also, when the camel begins to run short of liquids it is apparently capable of concentrating the remaining supply of water in its blood plasma, thereby avoiding the thickening of plasma which is a precursor of death by thirst.

Gauging Supply

Another way of stretching the water supply is to determine precisely the amount that will be available by seasons, and then to adjust one's activities to the supply. If an electric power company, for example, operates both steam and hydro plants, foreknowledge of river flow allows it to operate its plants as a team for utmost efficiency. Most such companies therefore employ private meteorological services to pinpoint expected flow, and several use cloud-seeding services to increase rainfall and snow pack upstream. Some cities which depend on rivers for their water spend money to forecast precipitation, and some of them, such as Ft. Worth and Dallas, Tex., also employ cloud seeders.

A power company which has its turbines between a higher-level reservoir and a lower-level one may increase the supply of power to meet peak demands by using water twice. It may employ surplus power during times of slack demand to pump the water back up from the lower reservoir to the higher one. Then the water is available to run back down through the turbines again, when the demand for power is highest.

The co-operative snow surveys which report on winter snow pack on western mountains are a fascinating example of teamwork. The mountains are deficient in ground-water storage, so the main water supply to be expected from them is in the snow, which piles high on their upper levels each winter, driven there

by the moist Pacific winds, and melts to run off in the spring and summer. Cities, industries and irrigation farmers all want to know how much water to expect. The interest of the latter lies largely in application of western water law, "first in time, first in right." This means that older decrees, on record in district courts, are satisfied first, and later comers get water only if there is enough for all. Therefore many farmers in an irrigation district must adjust their plans to an expected full supply of water, to a partial supply or, in a dry year on the mountains, to no water at all.

To meet the great need for information about the snow pack, the federal and state governments, plus private companies and individuals, established about 20 years ago the co-operative snow surveys that cover the whole mountain west and result in monthly water supply forecasts. Surveys are run monthly from Jan. 1 to May 1 on about 1,200 snow courses that together cover most of the important watersheds. Participants are members of the U.S. Soil Conservation Service, the U.S. Geological Survey, state experiment stations and state engineers, the Forest Service, the National Park Service, the army engineers in some areas, plus local organizations and persons such as power companies, city water departments, high-country ranchers, etc.

The procedure is simple but tiresome. Once monthly, a crew of men slogs on snowshoes over a 20- to 30-mi. course, stopping at the same spots each time. One man thrusts a long hollow tube vertically into the snow until it reaches the soil surface, withdraws it filled with a core of snow, and his partner weighs it on portable scales. Snow varies greatly in water content, but the difference in weight of the tube empty and full gives the weight of the contained water, regardless of snow depth. About 20 to 40 of these stops are accomplished daily. Once monthly all such results are added up, and maps and reports giving the totals, in terms of normal, are sent to all interested persons. These reports correlate with the monthly *Water Resources Review* of the Geological Survey, with reports of the Bureau of Reclamation as to storage in its reservoirs, and with the monthly *Water Supply Forecasts for the Western United States* which are issued in partnership by the Weather Bureau, the Soil Conservation Service and the California state division of water resources. Canadian provinces also participate in the case of watersheds which, like that of the Columbia, lie partly in Canada.

Ingenuity has short-cut some of this work. The California Electric Power Company has its watershed in the high Sierras planted with poles carrying vertical crossbars one foot apart. In one 35-minute flight in an airplane, an observer can accomplish what formerly kept a crew at work in the high mountains for a week, by photographing the poles to record how deep the

WATER PURIFICATION

This series of photographs illustrates some of the processes required to cleanse and purify water for drinking and other direct human use. The city is St. Louis, Mo.; the source of water is the Mississippi River; but the situation is similar for many other cities which are unable to obtain fresh water from mountain reservoirs and an aqueduct system (see p. 9). Each 1,000,000 gal. of river water at St. Louis is freighted with nine tons of suspended matter—principally mud—and has a high bacteria count caused by the dumping of sewage and industrial wastes upstream. The process of purification takes 24 hours. It begins (fig. 1) at the intake towers. Those shown are the three at the St. Louis Chain of Rocks bridge. Water flows by gravity through rock tunnels into a masonry chamber 68 ft. deep called the "wet well" (fig. 2). Before reaching the well the water has been screened of fish and large submerged particles such as twigs and branches. From the well the water is pumped into a presedimentation basin where about half the mud settles out and is deposited. As the water passes from this basin, lime and iron sulphate are added. Fig. 3 shows the slaker tank in which lime is converted into a liquid before being added to the water. The water and chemicals are mixed thoroughly in a baffle chamber (fig. 4) and pass into a sedimentation basin. The chemicals act to form jellylike coagulants which carry suspended matter and bacteria quickly to the bottom. After leaving this group of tanks the water is sterilized by the addition of more chemicals—ammonium hydroxide and chlorine. Final clarification of the water is achieved by filtering it through sand and gravel. Fig. 5 shows a cross section of a model of a typical filtration tank. Finally, the purified water is ready to be distributed to the consumer from one of the pumping stations (fig. 6).

Untreated water (left) and purified water (right), magnified samples showing elimination of harmful bacteria. Each white dot represents a colony containing several million bacteria (colony in cleansed sample is harmless variety). Grid pattern aids bacteriologists in counting colonies

SAND

GRAVEL

DRAIN

snow is around each. The photographs give the power company a very good idea of how much runoff to expect in the spring. In some areas, helicopters are employed in much the same fashion. Harry L. Potts, water supply engineer of the Denver Water Commission, simply drives monthly during the winter to a certain spot facing the 13,000-ft. mountains which provide a large proportion of the Denver supply. He photographs these mountains and calculates the relative area covered with snow. By comparing these photographs with those taken in past years, Potts obtains a close approximation of expected runoff.

The army engineers in southern California have gone one step further. They have planted cement blocks at ground level at selected points on the watershed, each block containing a wafer of radioactive cobalt in its upper surface. The gamma rays from this cobalt are beamed at a target, a radio transmitter, directly above. The water content of the snow that covers the block in winter weakens the rays in direct proportion to the amount of water cover; and the weakening of the radio signals, registered at a central point, gives the engineers a very good idea of the amount of runoff to expect.

Saving at Point of Use

The problem of saving water at the point where it is used has many facets, and all of them involve community control, sometimes to a degree for which public opinion is not ready. The attitude of the American citizen often constitutes one of the chief problems of the water supply engineer. It frequently represents an unrealistic complex arising from a past of unthinking plenty. Why should water be short? It falls all around us many times yearly from the bounteous sky. We find it hard to realize that the water we use, unlike the rain we run to get out of, is essentially a processed or even manufactured commodity, produced for our use by great labour and immense ingenuity and at large community cost. Subconsciously we think of water as being "free," and it annoys us to be ordered to save it, or to be told that we must pay more for it, or that we must finance a great construction program in order to ensure our continued use and enjoyment of it. We are the touchier because water supply is normally one of the duller and most routine of community activities, and "water never makes news until the well is dry" to paraphrase Thomas Fuller.

The U.S. Department of Commerce reported in 1955, however, that only 58% of the nation's major water supply departments had satisfactory reserves and that it would take \$3,200,000,000 to provide sufficient national reserve capacity. Nearly one-fourth of all communities in the United States are chronically short of water, to the extent that they impose some form of rationing. It is a rude shock to the city dweller, with his unthinking acceptance of the miracles that capable city government works daily on his behalf, to be rationed on water supply. Yet sometimes it is a salutary shock, as with New York city in 1949-50. The experience of that metropolis brought home to the nation the problem of water supply as nothing else has done. Since New York is a national nerve centre and news centre, water supply has been more nationally newsworthy ever since.

A picture of what life is like in a community that depends almost entirely on fresh water won from the sea might provoke similar interest. In Curaçao, in the Netherlands Antilles, the government sells freshened sea water to the people at \$1,300 an acre-foot, and still loses money; a household water bill may run from \$40 to \$50 monthly; people have found that there is a minimum drip where water meters will not register, and they run their faucets at that rate all day long, catching the water in pans. Industrial employees do all their bathing on "company water."

It isn't even necessary to go that far. Chamberlain, S.D., has

more water treatment capacity than the town needs, and sells its surplus "cash and carry" to surrounding towns and residents at \$1,900 an acre-foot, to which the buyer must add the cost of transportation. No water is wasted by those buyers! And when Dallas, Tex., in 1956 was forced by drought to call upon reserve supplies too brackish for many tastes, its dairy companies did a rushing business in delivering sweet water with the morning milk, and at nearly half the cost of milk, or 20 cents a half-gallon.

But the difficulty of providing an adequate water supply, in a nation whose inhabitants are accustomed to get all they want to use—or to waste—for only a few cents a ton, lies largely in persuading the public to pay enough for it. Some cities are wholly metered—that is, payment for water is based directly on the amount used. Others use various payment formulas based on such factors as size of lot, number of rooms and outlets, etc., but without measuring every gallon used. It is probable that every water supply manager, given a new start, would prefer metering, but it is hard to change over to meters because of the cost. Some cities meter new customers, and others meter consumers to whom they sell water outside the municipal boundaries.

Careless use rather than cheating is one of the greatest water wasters, and the way to check waste is to impose a charge proportionate to the amount of water used. In New York in 1949-50, a check on household facilities uncovered thousands of leaks that in the aggregate were wasting millions of gallons daily. Chicago, in a similar survey, uncovered leaks that were costing the city more than 10,000,000 gal. daily. Even a dripping faucet may waste many gallons over a long period. Nor is the householder the only offender. Neglect of community lines may result in losing thousands of gallons of water that have been brought a long distance and made wholesome for human use, all at community expense.

The psychology of plenty, where there actually is no plenty, sometimes affects public authorities as well as consumers. How else is it possible to explain commercial and industrial water-rate schedules which reward the large user by lowering the price per gallon as the quantity used goes up, and thus encourage them to waste water? In one city the cost to large users is as low as nine cents per 1,000 gal., and it was discovered during a drought that as much as 10% of the city's entire consumption was passing only once through air-conditioning or air-cooling devices and was then being dumped into the gutter. This condition was ended, and large savings were effected, merely by compelling such users to install recycling devices. Most users discovered that they were only being compelled to adopt good business practices, since, after the cost was amortized in a few years, they would save on their water bills.

Persons and organizations interested in community water supply problems might find it possible to stop large "leaks" of this nature by adopting stricter rules. Saving water that has already been expensively transported and treated is a thriftier way of stretching the community supply than building large and expensive new works to develop a new source.

Technical studies have shown that there may be considerable avoidable waste at the point of use on the 28,000,000 ac. of irrigated land in the United States. Irrigation farmers tend to wait too long to apply water and then overapply it. Since most crops do as poorly in a saturated soil as in one that is too dry, this alternation of water feast and famine cuts down their yield. Several types of water-need meters have been devised, most being based on the difference in electrical conductivity between a moist medium and a dry one. Porous blocks so made that they dry out at about the same rate as the surrounding soil, with an electrical attachment at either side leading to the surface, are buried in a field. The farmer clamps a resistance meter, with earphones, to the exposed attachments. If the underground block is dry and

TERRACED WADIES (stream beds) of the Negev desert, an aerial photograph of the remains of an elaborate system of water control devised by the Nabataeans, an Arab people of about 2,000 years ago. The lines across the channels are the bush-reinforced walls of the terraces. By collecting soil and water in the terraces the Nabataeans were able to farm the desert despite an average annual rainfall of only four inches. Some of the fertile terraces are still being cultivated

its resistivity high, he hears the high-pitched cry of his land for water; silence or a low hum reflect the moist contentment of the earth.

Large industrial users of water have found that it pays, either in money, or in community satisfaction with them as neighbours, or both, to install water-saving devices. Where water costs as much as \$500 an acre-foot, as in the Morro Bay installation of the Pacific Gas and Electric Company that freshens sea water for plant use, recycling and the utmost economy of use are automatically dictated. The Kaiser Steel Company, at its Fontana, Calif., plant, used recycling to reduce to 1,100 gal. the net amount of water needed to make a ton of steel, whereas 65,000 gal. is normal in the industry. Oil refineries that would otherwise consume as much water as a large city have been able to reduce their needs to a fraction by recycling. Some industries have found large sources of water in sewage effluent. The Bethlehem Steel Company, for example, buys part of the product of the Baltimore

sewage treatment plant for cooling and other purposes that do not involve human use.

Sources of Additional Water

But even if the nation should effectively make use of much of the water which is now wasted, people in some areas would still have to find new sources if population and the use of water should increase at the rate now indicated. Therefore, many agencies are studying the most promising means of providing new water. Three of the lines of endeavour, not necessarily in order of promise or importance, include: Development of new ground-water sources; production of fresh water from sea water or from brackish waters; and the possible increase of precipitation by means of cloud seeding.

Ground-Water Development

The agencies studying ground water are led by the U.S. Geological Survey, which has been collecting data on the subject since 1895, much of it in co-operation with state and local agencies. The supply of ground water is still relatively undeveloped. In many areas it may offer a large potential resource, since there is more water stored underground than on the surface. Much of it, however, is inaccessible, and much is so laden with salt and other minerals that it is unusable without special treatment.

Of the water that falls on the United States and is retained for some time before it finds its way back to the sea, an average of about 85% remains on the surface and 15%, or perhaps 200,000,000,000 gal. daily, percolates into the soil, some of this into the underground strata. Some remains in the soil only a few days to a few months, until summer brings its water-consuming plants and its evaporating sun and wind. But some moves deeper and becomes ground water, although not all water underground is entitled to this term. Water that is merely held in moist soil, where there are air spaces between sand or soil particles, is not ground water. Molecular attraction holds this water so strongly to the soil particles that it is impossible to collect the water from the soil. Nor is it possible to collect water in useful quantities from the rocks, of which it is a chemical constituent.

Ground water may be described as that free water which lies below the water table, the latter being the level beneath the surface at which soil or rock is entirely saturated. Quantities of ground water large enough to be considered worthwhile additions to the "manageable water crop" are found only in underground sand or gravel, or in fractured rock or rock such as limestone that

SALT-WATER INTRUSION. Natural shoreline conditions are shown at the left; the fresh-water table slopes gently toward the sea. Excessive pumping, however, as shown on the right, depresses the water table and draws salt water into the fresh, eventually contaminating the well

has been eaten full of holes by the chemical action of the water itself. Such underground formations are called "aquifers."

Salt water is denser and heavier than fresh water. Therefore in the slow arrangement of geologic ages, most supplies of fresh ground water ride on top of salt-water strata. Too rapid withdrawal of the fresh water may bring the salt water rushing in to replace it. At many points near the seacoast, fresh water is obtainable from wells which lie almost to the brink of the sea, but some communities in such places have suddenly found their wells offering only salt water. One Texas seacoast community found that overpumping had lowered the fresh-water table to a depth 100 ft. below sea level.

Wide areas of the nation, where impervious rocks underlie the surface only a few feet down, or where rainfall is so scanty that the underground remains dry and there is no subsurface runoff from mountains, are without large ground-water resources. Ground-water supplies are largest where copious rains have soaked the surface for ages.

Some large reserves are found along the beds of "fossil rivers" which have dried up on the surface. One example is the mighty Teays, a river greater than the present Mississippi, which once rose in what is now North Carolina and flowed across Ohio, Indiana and Illinois to empty into an arm of the Gulf of Mexico which then extended above the present site of St. Louis. Other supplies percolate underground toward living rivers or are cut across by the river channels and are in geological fact tributary to such rivers.

From the mechanical standpoint all ground waters may be classified as those under pressure and those not under pressure. The latter may be tapped by the ordinary surface well, a familiar sight in rural places. It consists simply of a vertical shaft sunk far enough into the ground-water zone so that the water in the surrounding soil will run into the well by gravity. If such a well were left alone, the water would simply rise to the water-table level and stay there. But pumping creates a condition in which the water is drained by gravity from the soil around the well, forming an inverted cone. Drainage into the well is down the slope of this cone.

In many cases the water has percolated a long way down slopes of inclined underground strata. It sometimes has taken hundreds or thousands of years for the journey, and the water finally has ended up as an aquifer scores or hundreds of miles from the mountains or hills where it originally entered the ground. Typically, it has seeped along permeable layers trapped between or beneath strata of dense impervious rock, and so is under pressure, sometimes great pressure. It may find a fissure and escape in living springs, some so large as to originate small rivers. In many areas the underground pressure pool has remained to be tapped by wells driven through the upper rock lid; here the water will rise in the well and, if the pressure is great enough, will spout into

BAKED MUD FLAT, once the Red Butte (Ariz.) water hole. During the ten years from 1941 to 1951 water was continuously withdrawn for irrigation, but because of severe drought conditions little was replaced. As a result, the ground-water level fell until all that remained was the hard mud surface with fissures large enough to admit a man's arm

the air. This type of underground basin and well is called "artesian." There are many such basins in the United States, and their history is invariably that they lose pressure as more and more wells are put down, until at last the wells have to "go on the pump." Such wells are much more expensive than the simple surface type of well.

Some ground-water reserves have been greatly overdrawn, as in the Texas Panhandle where "water mining" is estimated to be drawing water from the underground store at 20 to 40 times the natural rate of replenishment. But other such reserves have scarcely been touched. One of the largest of these stretches from north to south along the Great Plains, beginning at some distance from the Rockies whence the water originally flowed. All these plains were formed of material washed or blown down from the Rockies as the latter were worn down, thus forming huge reefs, now underground, of sand and permeable soils, into which the mountain waters also percolated and lodged. Nearer the mountains the rivers, generally speaking, have cut into and drained the underground reserves.

The "New Water" Theory of Stephan Riess

Stephan Riess of California formulated a theory that "new water," which never existed before, is constantly being formed within the earth by the combination of elemental hydrogen and oxygen, and that this water finds its way to the surface and can be located and tapped, to constitute a steady and unfailing new supply. In 1956 a foundation was financed by Clint Murchison of Texas to investigate the Riess theory, which Riess claimed

ARTESIAN WELL flowing just after penetration of an artesian zone 210 ft. deep within a glacial drift near Kent, Wash. The water is shown flowing at about 1,700 gal. a minute through the six-inch-diameter well

to have vindicated by the successful drilling of many wells.

Hydrologists generally doubt the existence of "new water," although that of "juvenile water" has long been conceded. This latter is water which has always existed in the earth but which is only now reaching the surface through volcanoes, geysers, hot springs, etc. It is generally too full of minerals to be fit for human use.

Dowsing or Water Witching

Another controversial theory for finding water is that of dowsing, a procedure which involves holding in the hands a forked stick (generally of hazel, willow or peach) or other object. When held over a source of water, the forked stick turns downward strongly. Only a few persons seem to have the gift of locating water by this method, and the theory is scouted by most hydrologists. But it has strong advocates who claim many successes in finding subsurface water by means of it.

Freshening Salt Water

One potential source of an increased water supply lies in reclaiming waters which are too full of minerals to be useful. The most striking example is in the concerted efforts being made by many agencies, public and private, including the United Nations, the U.S. government and other governments, to find economic means to freshen sea water.

The art of freshening sea water goes back to the 16th century. It is now practised to reclaim many billion gallons of water yearly. Conversion equipment varies from survival kits on sea rafts to huge installations supplying the needs of whole populations. For example, the sultanate of Kuwait has a purification plant that supplies 2,000,000 gal. of fresh water daily, using as power "free" natural gas that would otherwise be wasted, and in 1956 the capacity of this plant was being doubled. Formerly, Kuwait had to get its fresh water in the dry season from the confluence of the Euphrates and Tigris rivers, 100 mi. away, whence it was brought by dhow. The French have an experimental installation in the Gold Coast in Africa which brings cold sea water from the depths and vaporizes it in a semivacuum, producing fresh water, salt and power, all scarce commodities in the region. It has already been mentioned that Curaçao, in the Netherlands Antilles, produces fresh water from sea water, and in 1956 it was announced that the government of Aruba, a neighbouring island in the Netherlands Antilles, had let a contract for the designing and building of the world's largest salt-water conversion plant on the island. Large installations were also being planned on the island of Bahrein in the Persian Gulf, and in Israel.

One big utility in the United States produces fresh water from sea water for the needs of its plant, while another in north Texas is experimentally producing fresh water from brackish waters which are plentiful in its vicinity.

The U.S. congress has financed an elaborate and continuing research program seeking an economic process for freshening sea water and other salty waters. This program centres in the office of the Secretary of the Interior. Any installation to use sea water would necessarily be near the coast, but seacoast cities are large consumers of river water which flows down from the interior. So if they were supplied cheaply from the sea, such cities could then leave the river supplies to the people inland.

But all such programs must meet the stern test of economics;

FRESHENING SEA WATER BY ELECTRODIALYSIS. Salt water enters a charged watertight tank at the top. In the two chambers marked "Fresh" the positive ions, shown as cubes, pass out through screens toward the negative electrode; similarly, the negative ions, shown as spheres, pass through a screen on the opposite wall toward the positive electrode. In the three chambers marked "Salt," however, the screens are reversed in relation to the electrodes, thus trapping and collecting the ions

DOWSING

Water dowsing (or water witching) is the detection of supplies of underground water through the use of a dowsing rod—a flexible Y-shaped twig of any woody plant (commonly hazel or willow), or a pendulum. In the hands of a skilled and experienced dowser, it is claimed, the device will by its movements enable him not only to locate underground streams and veins, but even to tell the depth of the vein, amount of flow and quality of water.

Henry Gross of Biddeford, Me. (shown above), has dowsed for individuals and companies in many parts of the United States and other countries. Novelist Kenneth Roberts, Gross's associate, reported many of their cases in two books, *Henry Gross and His Dowsing Rod* and *The Seventh Sense*, both published by Doubleday & Co.

that is, their costs must be compared with those of other means of obtaining water. Present programs are situated in locations where water is needed so badly that cost is not the final criterion. To quote a report on the subject made to the United Nations, "the cost is never too high when human life is at stake." No one cares that fresh water from a survival kit costs \$5 a pint; but for large-scale use in competition with other sources, such as for supplying an American city or for crop irrigation, fresh water from the sea is still too costly. Many methods have been devised to separate salt from water or water from salt, but all develop innumerable costly complexities when put into actual operation.

Sea water averages 35,000 parts per 1,000,000 of contained minerals, mostly sodium and chloride, but including at least 49 of the elements. The U.S. Public Health Service's criterion for drinkable water of the best quality allows for no more than 500 parts contained solids per 1,000,000, although 1,000 parts is permissible. In some areas people survive on water containing as high as 3,000 parts per 1,000,000, simply because they have to. They are never happy about it.

Vegetation, particularly food plants, is more selective about water than is man or his animals. For example, some plants are hurt by as little as 1 part of boron in 1,000,000 parts of the water they drink, and by very small amounts of sodium. Salt hampers the water intake of plants and may starve them by indirection. In short, any water that plants thrive on is acceptable to man, but the reverse is not true. The Bureau of Reclamation rates as "excellent" for irrigation only water that contains less than 175 parts per 1,000,000 of minerals.

Concerning cost, the Department of the Interior program set a first goal of \$40 an acre-foot for irrigation water and \$125

an acre-foot for municipal water. These figures are very high, several times the current costs of providing water except in very special circumstances. But even so, they are far from being attained. At present, by existing methods, from \$300 to \$330 an acre-foot, or 90 cents to \$1 per 1,000 gal., appears to be the practicable lower limit of cost. To this must be added the cost of distribution and of getting rid of the solid salts or the brine into which the unwanted minerals concentrate. The sea water conversion plant of the future will probably be a complete chemical conversion unit which will continuously separate many useful products from sea water—pure water, lithium, magnesium, bromine, chlorine, gold, sodium, etc.

The limiting economic factor for fresh-water extraction is the cost of energy. It takes a certain required amount of energy to free water from its mineral content, whether that energy is supplied by nature or by man. In the case of sea water the minimum cost of such energy runs about \$20 an acre-foot, even if power is supplied at the low figure of $\frac{1}{2}$ cent per kilowatt-hour. So the search for an economical method of extraction evolves into a search for low-cost power. Cecil Ellis, in *Fresh Water From the Ocean*, computes that the separation of 1,000,000,000 gal. daily of fresh water from sea water would require a power plant of 830,000-kw. capacity, or enough to supply a large city.

It is possible, of course, to use the "free" energy supplied by the sun to evaporate sea water. However, the sun's energy is available only part of the time, and the complex apparatus which would be required to collect and condense the water would be costly. Briefly, no present method of freshening sea water appears to promise really large supplies at a cost low enough to supplant present sources for general use. Yet as the work progresses, new ways and short cuts open up. Hence, the program appears to be a wise and long-sighted one, to provide for a day when increasing need and decreasing cost may meet. Congress in 1956 again increased the funds first provided for this program and lengthened its life. In that year, Secretary of the Interior Fred A. Seaton said he thought fresh and palatable water from sea water might be piped to many points in America "before the year 2000 or even 1990."

Following are some possible ways of reclaiming salt water, but no attempt is made here to choose the best among them, since each has its earnest proponents:

1. Freezing salt water to drive the brine into an unfrozen core, then cracking off or otherwise removing the fresh-water ice.
2. Distillation by solar energy, either by itself or in combination with other practices. Construction of an experimental solar distillation plant covering $\frac{1}{8}$ ac., to produce 600 gal. of fresh water from sea water daily, was planned in 1956 in San Diego, Calif., under the Interior Department program.
3. Boiling at high heat and under pressure, then piping the hot steam back through incoming sea water to preheat the latter.
4. Sieving out the salt or the water by selective membranes, as certain forms of aquatic life sieve out or concentrate within themselves unneeded or needed elements; kelp, for example, concentrates iodine, and a large marine alga cited by Ellis contains a proportion of potassium 42 times as great as in the sea around it, but only one-fifth as much sodium.
5. Putting sea water under electrical tension. Salt dissolved in water separates into its constituent sodium and chlorine ions, which are charged particles, the sodium ion being positively charged and the chlorine ion negatively charged. Since like charges repel and unlike charges attract each other, a tank of sea water may be "sliced up" transversely by a new type of plastic membrane, each adjacent pair composed of one sheet that will allow only negatively charged ions to pass through, and another sheet that will pass only positively charged ions. When the tank is charged at the ends with an electric current, the positive ions

CLOUD SEEDING. Ground generator (at left) releases silver iodide particles into the air at the rate of 30,000,000,000,000,000 a minute. The particles are swept up mountain slopes by normal air currents and updrafts, entering the clouds at 10,000 to 15,000 ft. Reaching the freezing point, they are supercooled and gather moisture to form ice crystals. These in turn are converted to snow, later turning to rain as they fall. Inset shows detail of ground generator

begin to move away from the positive pole, the negative ions from the negative pole. They move until each type meets the membrane that bars its progress, so that the water freshens in one of these narrow slices or cells and grows saltier in the next. The fresher water may be piped off for use and the saltier water discarded as waste.

Such "partial" processes as ion exchange, which freshen water little by little, are more suited to treating water which is merely brackish than is complete distillation. Many types of ion-exchange water softeners are already in use for special purposes, from household units to large industrial installations. The immediate possibilities of the separation processes lie in the fact that the cost of eliminating minerals is directly proportional to the percentage of minerals in the water, and there are large sources of brackish water in the United States which contain too much salt to be usable, but not nearly as much salt as sea water. In many places such waters come so near to the surface that they inhibit crops, and where fresh irrigation water is cheap and plentiful enough, it is often used merely to wash the salts out of surface soil.

Where brackish water contains only a little too much salt to be useful, it may even now be reclaimed at a cost that farmers and city dwellers can pay, in some instances not more than \$5 an acre-foot.

Mining Icebergs

There is another possibility, if only for the future, in taking advantage of work that nature has already done in freshening sea water. This consists in mining icebergs for fresh water. At first glance such a scheme seems fantastic, but it is being seriously discussed as a future possibility. The water frozen in the polar ice caps is fresh water, and there is probably more of it than in

all other surface or underground fresh waters of the earth, some estimates being that the ice on the earth's surface totals several million cubic miles. The ice caps are constantly "calving"—that is, pieces of them are shoved off the continental shelves by relentless crowding from behind—and these float away as icebergs. These bergs may be enormous, especially in the Antarctic, a single one of them weighing billions of tons and containing perhaps up to several million acre-feet of fresh water.

John D. Isaacs of the Scripps Institution of Oceanography pointed out that such bergs often float northward from the Antarctic for thousands of miles on the Humboldt Current. He calculated that the cost of keeping them on this northward course by using ocean-going tugs would be small, compared with the cost of bringing fresh water to the coast of southern California by other means. Once such a berg was anchored off the coast, harvesting the water would be simple. Fresh water will float on top

CLOUD BOILING UP shortly after being seeded with silver iodide

of salt water, so the berg could be surrounded by a watertight fence and a fresh-water lake would form which could be tapped by pipeline from the shore. Isaacs calculated that as fresh water from the atmosphere would also condense constantly on the berg's cold surface, the total yield might thus be considerably increased. Therefore, when the needs of an increasing population press hard enough upon available fresh-water supplies, a fenced fresh-water lake in the ocean may be added to the tourist attractions of southern California.

Cloud Seeding

Another possibility of increasing fresh-water supplies lies in precipitating, if possible, more of the huge volume of fresh water which is freed from the salty ocean by evaporation and which floats over the earth in the atmosphere. Why should man do all the expensive work of purifying water if it is possible to increase the fall of water which is already cleansed by nature? It should be noted, however, that rain water is not by any means absolutely pure. It is rather a very weak mineral soup, since the raindrops sweep down all sorts of particles from the atmosphere. These include a small amount of entrapped nitrogen, which is vital to the growth of plants. In a humid climate, precipitation will bring down several pounds of nitrogen per acre per year, a weak solution, indeed, but perfectly suited for feeding plants. Householders know how much better and faster their lawns and gardens respond to even a light rain than to water laid on with a hose.

An ideal solution of the need for water would therefore seem to lie in the possibility of inducing nature to let down more rain and snow, and a technique has been worked out to do this, called "cloud seeding." Although developed as early as 1946, the concept of cloud seeding is still subject to dispute, but there is increasing evidence that seeding does change the characteristics of clouds and their behaviour. That it may afford a means of changing whole climates and of making desert areas bloom, however, remains a matter for the remote future and awaits a vastly improved technology—if it can be done at all. Man's powers are still too weak and partial to alter the course of the vast currents of air that sweep the sky and that by their clash and interaction bring down rain.

The technique is to watch what nature does and then try to do likewise. A cloud is formed when the air can no longer retain water as invisible molecules in the form of transparent vapour. This is wholly a matter of temperature. Warm air can hold much more water in the vapour state than can cold air. At 90° F. a cubic foot of air can hold approximately $\frac{1}{2}$ oz. of water vapour, while at 32° F. it can hold only about $\frac{1}{16}$ oz. And the atmosphere grows colder rapidly with increasing height, so that at an altitude of several miles above the earth the temperature is colder than zero, even in summer.

But water vapour, to condense, must have something to condense upon (down to about -40° F.), and this is supplied by the invisible particles which are always present in even the clearest air. Cloud is composed of tiny water globules, each condensed on one of these particles or nuclei, and under the right conditions these water globules will further coalesce into raindrops, or freeze into ice crystals, which pull in surrounding moisture and thus grow into snowflakes large enough to fall.

Much cloud floats along in the peculiar state called "super-cooled"—below freezing, yet still liquid. In fact, water droplets will not all spontaneously flash over into ice crystals until the temperature goes down to about -40° F. Vincent Schaefer, formerly of the General Electric Company, found that if part of a cloud can be cooled by any means to a temperature lower than -40° F., snow will form, and that this effect will spread through the cloud. He used dry ice, first in the laboratory and then in the atmosphere. Bernard Vonnegut, a fellow worker, found that

A SMALL MULTIPURPOSE WATER PROJECT in Nebraska. At the top a small storage lake collects water from a larger lake farther away and from nearby runoff, and thus serves somewhat to check against floods. The water is then diverted through the power plant (centre) for the generation of electric power. Finally, the water is released into an irrigation canal which makes it available to farms

crystals of silver iodide (a compound of silver and iodine) are so like crystals of ice that they will "fool the water" into freezing at temperatures much warmer than -40° F., though still below freezing. The most popular present technique of cloud seeding is

to burn silver iodide at high heat in a small furnace on the ground, whence it is wafted skyward in the form of crystals, billions of them each minute. Released according to the operator's skill and knowledge, so as to drift on the winds into an oncoming or forming storm, the silver iodide crystals add greatly to the number of nuclei that nature provides. If rightly placed, they greatly increase the number of snowflakes or raindrops that form, and gravity brings the snow or rain to the ground.

In 1952, by congressional authority, the president named a commission of leading weather experts to investigate the whole subject of weather control. This group reported in 1956 that six out of seven seeding projects it had investigated, all admittedly conducted under very favourable conditions, had increased precipitation variously from 9% to 17%, and that seeding "produces results which are not spectacular or breathtaking, but which can be very important to the water economy of the nation."

Further, the technique of seeding clouds from the ground is so inexpensive that an economic study conducted under the commission's auspices showed that an increase of 1% in rainfall in semiarid regions will increase crop values enough to pay for a year's seeding. Also, some of the increased precipitation will percolate into the ground or increase the stream flow. One long-continued power company project in seeding a high mountain watershed apparently produced much more than enough extra power to pay for itself and enough extra water to meet the domestic needs of 25,000 to 40,000 persons downstream, an over-all

increase of about 9% in runoff.

Yet it is very easy to overkindle enthusiasm about the possibilities of cloud seeding, as both clients and seeders have found. For one thing, the projects evaluated by the president's commission were all in the most favourable terrain, where moist air currents from the Pacific were forced up and over the mountain ranges. It was relatively simple to station silver-iodide generators right in their path. During 1956 the commission was conducting and studying projects undertaken under greater difficulties.

The behaviour of "warm" clouds is also coming under intensive study. These do not freeze, and air temperatures show that such clouds supply most of the rain for large regions, particularly in the tropics. The specialists believe the seeding agents in these cases are relatively large nuclei, such as particles of sea salt blowing over the continents. Water drops and droplets themselves are also believed to act as seeding agents here, as they are dashed around by the winds in the interior of storms. In Australia, in particular, elaborate experiments in releasing fine sprays of water into the upward currents in the hearts of incipient storms have been followed by apparent large increases in rain.

WATER BY TELEPHONE, an example of supply control as practised at the local level—the water user's association of Phoenix, Ariz. Top left: Operators in the field office receive water orders and notify customers by telephone when water will be turned into irrigation ditches and supply mains. Service on a zone system reduces costs. Bottom left: Service schedule is posted along a roadside. The schedule records the amount of water delivered to users in the area. Right: A home-owner flooding his lawn by releasing water from an underground line. The yard is surrounded by an earth dike, permitting the lawn to be covered to a depth of four inches. Watering is allowed each 12 to 16 days

HOOVER DAM OUTLET WORKS shooting water into the river below the dam. The size and power of the streams of water may be judged by comparison with the group of men riding a skip above the river. On the left and right sides of the canyon walls are parts of the hydroelectric power station

Seeding is studied also as a means of lessening lightning and suppressing hail by "triggering off" rain and thus reducing the potential violence of thunderstorms. It should be emphasized, however, that seeding will not end drought, since a dry sky can produce no rain, and in drought areas the skies are dry. In an area seeded the year around, there might be no more frequent storms, but each storm might produce a little more precipitation.

A National Unified Water Policy Needed

In the physical realm we know what to do, to increase or to conserve the national supply of usable water. But the national difficulty is in deciding to do it and to summon the joint determination to stage a unified attack upon the water problem through an effective national policy. The problem has been studied, in whole or in part, by at least a dozen official national groups and commissions since 1940, including the two Hoover commissions, the President's Water Resources Policy Commission of 1950 and, more lately, by the President's Advisory Committee on Water Resources Policy. Each group has recommended unified long-range policy and practice within the area of its study, be it a

river basin or the continental United States.

Yet we are a long way as yet from such a policy. Must nature make it a condition of national survival before we tackle our water problem as a whole? Why do we lag? It is largely because the problem originally presented itself, and continues to do so today in many aspects, to each person only in terms of his own needs and to each interest in the terms of its own desires.

The New York householder is interested primarily in ensuring that his faucets run healthful water at a price he thinks he can afford, the western irrigator in a sure supply for his fields. The power company manager thinks in terms of enough water to turn his turbines; the industrialist in terms of water as an indispensable raw material, solvent or coolant, and as a convenient carrier-away of his wastes; the transportation man only in terms of its function as a highway, and so on.

Each such interest has attached itself to the water complex at a different point, and as the use by each has grown and the avail-

able water becomes inadequate to supply the needs of all simultaneously, each has at some point found itself face to face with a rival claimant for the same water. Each interest may be represented also by a different governmental unit, federal, state or local, and each such governmental unit has behind it an active lobby of citizens, if the need requires. Most such groups on the national scene maintain offices in Washington, D.C.

There was a joint water supply service in Boston, Mass., as early as 1652, but it was not until 1875 that the first filtration plant for domestic water was established, at Poughkeepsie, N.Y. By 1956, of the 570 largest community water supply plants, only 14 still distributed wholly untreated water to their users.

Congress passed its first antipollution act in 1886, one that forbade the dumping of sewage and garbage into New York harbour. Although the army engineers had been commissioned to improve navigation at the very birth of the republic, and specific authority to deal with flood problems in single basins had been granted them later, it was not until 1936 that their civil functions were widened to include a nation-wide flood-control program. It was only in 1902, when it was recognized that the resources of private capital and enterprise clearly were no longer able to deal with the growing size and complexity of the works necessary to harness the great rivers of the west, that congress created the Reclamation Service, now the Bureau of Reclamation. And even today its works supply the water, in whole or in part, for only 7,000,000 of the nation's 28,000,000 irrigated acres.

Only in 1935, and then fortuitously to meet a crisis of regional decay, did congress authorize the Tennessee Valley Authority to deal with a river basin and its waters as an organic whole, an example not yet followed in any other large domestic basin (largely because of clashes of various interests as to the division of benefits) although adopted, in whole or in part, in more than a score of river basin projects elsewhere throughout the world.

In 1948 congress passed the first act authorizing the U.S. Public Health Service to deal with interstate pollution, although in a very limited way and in strict subordination to the wishes of the

TWO GREAT DAMS OF THE WEST: Left, Grand Coulee Dam, Washington; below, Shasta Dam, California. Both dams were built for multiple-purpose benefits: flood control, irrigation and electric power. Grand Coulee was completed in 1942; it is 4,173 ft. long, 550 ft. high and has a volume of 10,585,000 cu.yd. The photograph, a view toward the southwest, shows clearly the relationship of the dam and reservoir to some of the land surrounding them. Shasta, located in the mountains of northern California and in sight of the peak from which its name was derived, was completed in 1945; it is 3,460 ft. long and 602 ft. high

FONTANA DAM, Little Tennessee River, North Carolina. Fontana, a key dam in the Tennessee Valley Authority system, was completed in 1944. It is 2,385 ft. long and 480 ft. high. The dam serves for flood control and navigation purposes as well as furnishing power at a capacity of 202,500 kw.

states—those which originate pollution as well as those which suffer from it. In 1954 came the Watershed Protection and Flood Control act, which sought, though also in a limited way, to authorize and to encourage the efforts of local citizens and organizations to protect watersheds “from the top down.” Both these acts were extended and strengthened in 1956.

Other federal agencies which have important water supply and water conservation functions include the Department of Agriculture, largely through the Forest Service and the Soil Conservation Service, and the Department of Interior, through both the Bureau of Reclamation and the Geological Survey. The latter has since 1888 been compiling data on surface-water supply and since 1895 on ground waters. Its statistics and its engineering and geological studies are by now literally beyond price; there would be no means of attacking water problems nationally if it were not for them. But still more data are needed.

The Weather Bureau measures and forecasts precipitation and thus deals with expected supply. Scores of other federal agencies, for example the Bureau of Indian Affairs and the National Park Service (both of the Interior Department), deal with water in ways that are contributory to their main functions but that are nonetheless often locally and nationally significant.

Each state has established an agency, or sometimes several, to deal with water supply and to enhance water conservation. In most instances such agencies were originally created to deal with a single phase of the water complex, as the federal agencies originally were. Disputes among classes of users are repeated within states as well as nationally. If the states, particularly the 17 western states, may be said to have a water policy in common, it is the assertion of complete state authority over water resources, together with incessant demands for federal aid. States both co-operate and compete with each other and with the federal government in demanding, husbanding and developing this vital resource. In various parts of the nation, those states which share a single river basin have formed organizations among them-

selves, all the way from loose compacts to effective and close-knit administrative agencies. In some regions, particularly where water is scarce, it sometimes seems that interstate compacts were formed chiefly for the purpose of more effective interstate feuding; but in other instances they are very useful co-operative organizations.

Multipurpose Dams

Physically speaking, the most important development relating to water in the United States during the 20th century was probably the multipurpose dam, as the final evolution of that prehistoric line of stones across a brook. Most dams before this time were single-purpose ones; that is, each was set down at a single point in a river for one particular purpose, such as flood control, navigation, power development, domestic water supply, irrigation, etc. But planners and engineers evolved the idea of dams high enough, long enough and with reservoirs capacious enough to serve several such purposes at the same time. Such a dam typically has space assigned to store the silt that comes down the river, to control floods and to store water for such specific purposes as irrigation, domestic supply or the generation of power. It might be characterized as an all-purpose valve controlling a whole river. The great modern dams—Hoover, Grand Coulee, Shasta, Fort Peck, etc.—are all multipurpose structures.

But to store a very large quantity of water at a single point requires a dam either on the main stem of a river or on a major tributary, and usually well down the tributary. This seems natural and right to the people downstream, who profit from a regulated flow from above, but it often appears in a different light to people upriver, and from this derives one of the great and growing conflicts in United States water supply policy.

If it were possible to find a wholly virgin river basin without

Above: Contrast of sagebrush wastelands and fertile, arable valley irrigated from the Yakima River near Prosser, Wash.

IRRIGATION

In the 1950s irrigation and industry accounted for about four-fifths of the 200,000,000,000 gal. daily consumption of water in the U.S.

Right: All-American canal, which carries water from the Colorado River to irrigate the Imperial and Coachella valleys of southern California. The photo shows the canal crossing the desert west of Yuma, Ariz.

Above: Siphon tubes delivering water to a Nebraska cornfield. Dam in the foreground regulates the water so that it is evenly distributed to each row

Right: Canal tender, or "ditch rider," adjusting flow of water in irrigation canal of the Salt River project, Arizona. Water from the canal is applied to fields either by direct flooding or by methods such as siphoning or sprinkling

Below: Farmer adjusting valve on sprinkler irrigation system. Sprinklers operate under pressure, and extra power is usually needed for this type of irrigation

a single human inhabitant, and to study and shape it from the beginning with an eye to the most valuable development of its water resources, and then to settle the people where they could take best advantage of those resources, the place to begin would be at the top of the basin, far back in the mountains or hills. There would be two reasons for this: First, the relatively narrow and deep canyons of the upper basin are best suited for water storage, since their depth would minimize evaporation as compared with a wide flat valley downstream; they are also less suitable for intensive human settlement. Second, stored water is as a general rule available only below the point of storage, and by this device most of the water would be contained above the points of use.

But development does not in real life proceed in that fashion. Storage is more immediately beneficial near the point where people need to use or control the water. Human settlement proceeds inward from the seacoasts, and the big cities and populous rural districts grow up around the estuaries and in the plains downriver. The people there begin using the water where it is, and by the time water planning and upstream settlement have begun, the downriver people have established what they claim as vested and prior rights in the water supply, and they often assume to dictate for their own purposes the development and the uses of the whole stream.

Feuding Over Water

This priority of settlement is the essential cause of most of the country's river basin disputes. Some have become so acrimonious as to resemble cold civil wars, as in the Colorado basin. The people at the top of the watershed refuse to be left out, and they reinforce their refusal with every economic and political weapon at their disposal. Such priorities are also at the bottom of local water feuds, and, particularly in the west, there is a saying that more men have been shot over water than over gold. Every irrigation project must have a water master to resolve disputes. (There is a western story of a lawyer who heard that a certain interstate water dispute had been settled, whereupon he sighed and said, "Too bad. It put my father through college, it put me through college, and I was counting on it to put my son through college.")

There have also been feuds between federal agencies themselves. As the army engineers worked upstream from the coasts and the Bureau of Reclamation worked downstream from the mountains, for example, they eventually found themselves presenting elaborate and rival plans to congress for development of the same basin. This was resolved by the Flood Control act of 1944, which ended, at least on the surface, the most famous of these feuds, that over the Missouri River basin. This act allotted the army engineers control over dams for flood control and navigation purposes, gave the Bureau of Reclamation control over irrigation functions and gave the Interior Department control over the sale of electric power. In the case of the Missouri River itself, the act reserved its waters originating west of the 98th

UPSTREAM CONTROL PROJECT constructed of earth and timber. The sandbags and planking become more effective after underwater vegetation growth and siltation fill in. Adjustable spillway permits regulation of flow

meridian primarily for western domestic and irrigation purposes.

Much progress has been made in resolving jurisdictional difficulties, and state, federal and local agencies are learning to operate more effectively together. Perhaps the largest remaining area of confusion and conflict lies in the status and development of ground water. The nation has never made up its collective mind where jurisdiction of such waters should lie: whether they are always attached to a surface water system, and therefore should come under the rules governing the distribution of surface waters; whether they are owned by the owner of the surface; or whether, like oil, they are "wild" and subject to capture by the first comer to put down a well.

The usual story is that the first group to tap a ground-water deposit thereupon attempts to assert a vested right in it and resists attempts to impose state rules, meanwhile opposing the attempt of later comers to tap in on the supply. Most states, particularly in the west, have attempted to enact ground-water codes, but where these exist they usually lack enough authority to exert much effect upon the conservation of ground water. South Dakota in 1955 succeeded in establishing a law based on complete state ownership and requiring a state licence to put down a well, but this is an exceptionally strong law.

Upriver Revolts

One interesting aspect of the past few years concerns what might be called the revolt of the upstream folk. As has been noted, river development has been largely in behalf of downstream users, through big "main stem" dams. The news that is published of disastrous floods, as in 1951 and 1955, centres largely upon the damage to populous towns and downstream industries, while upstream damage is largely unreported.

For example, the picture that the nation got of the great Missouri basin flood of 1951 that centred in Kansas was largely concerned with broken levees, flooded cities and damaged industries. But the Soil Conservation Service concluded after a special study of this flood that the upstream damage—ruined farm struc-

tures and standing crops, fields ruined by erosion or sanding, rich topsoil carried away—reached the appalling total of \$400,000,000, or more than all downstream damage. The Department of Agriculture in general, and the Soil Conservation Service in particular, have long laboured to focus national attention upon the problems of upstream dwellers, especially those of farmers. Their thinking and that of their adherents went as follows:

Every person in the United States lives in a watershed, from a hundred square feet to several acres in area, which drains into a larger shed, which drains into a still larger one. All large watersheds and major river basins, therefore, are made up of a system of much smaller sheds which fit together like the pieces of a jigsaw puzzle.

Now, say the upstream dwellers, give the people of each local shed the encouragement, the planning and some of the means to stop the water where it falls, through terracing, through contouring, through keeping the soil in good organic state to hold water and covered with protective vegetation, etc., and to build small retaining and retarding dams at key points so as to reduce violent runoff. Do this watershed by local watershed, and this will eventually solve the water problem of the whole major basin.

The advocates of this method met at first with violent opposition, but great success has been claimed in retaining water in the land and in cutting down flood damage in pioneer projects of this nature in Oklahoma, Nebraska and elsewhere. Supporters finally succeeded in 1954 in getting congress to pass the Watershed Protection and Flood Prevention act, which congress amended in 1956. The original act hedged small watershed projects about with many reservations and limitations. Despite all these barriers the act proved so popular that by the end of fiscal 1956 the Soil Conservation Service had received nearly 500 applications for assistance from 46 states, had authorized 164 projects for planning in 44 states and had submitted 13 specified work plans to congress. Costs in most such instances are divided about equally, between the local people and the federal government.

The National Prospect

As of 1957 the national prospect is that the problem of water supply will from now on force itself increasingly upon the nation. More ingenuity and human effort than ever before, plus a greater proportion of the national income, must be spent on water. The prospect is for greater emphasis on developing the water supply for domestic and industrial use, and for relatively less emphasis on new, large-scale irrigation developments and on the use of water to develop power. In the realm of government, the outlook is for an increasingly closer approach to a truly national water policy.

The United States has developed into the most complex and highly advanced material civilization on earth. To maintain its standards, the nation must pay increasing attention to developing sources of raw materials, of which water is probably the most universally necessary. The measure of our wisdom in regard to water may well measure our future material advance. The passage of time will reveal whether our ingenuity is capable of meeting the challenge, to increase the manageable water crop sufficiently to supply our needs for the future.

BIBLIOGRAPHY

Following is a selected list of books for the reader to consult for further information on the fresh water supply problems of the United States.

General

- Carhart, Arthur H., *Water—Or Your Life* (J. B. Lippincott Company, Philadelphia, 1951), a discussion of the nation's water problems by a well-known conservationist.
- Collis, John Steward, *The Moving Waters* (William Sloane Associates, New York, 1955), a book by an English farmer, poetic in spots, but with a good deal of information interspersed on the characteristics and use of water.

- Forman, Jonathan, and Fink, Ollie E. (eds.), *Water and Man, A Study in Ecology* (Friends of the Land, Columbus, O., 1950), essays on various aspects of the subject, each by an authority in the specific field.
- Fox, Cyril S., *Water, A Study of Its Properties, Its Constitution, Its Circulation on the Earth, and Its Utilization by Man* (Philosophical Library, New York, 1952).
- Frank, Bernard, and Netboy, Anthony, *Water, Land and People* (Alfred A. Knopf, New York, 1950).
- King, Thompson, *Water* (Macmillan Company, New York, 1953), a book by the director of the Maryland Academy of Science.
- Kuenen, P. H., *Realms of Water*, trans. by May Hollander (John Wiley and Sons, Inc., New York, 1956), a generalized, semitechnical but fascinating discussion of water and its role upon the earth and in human affairs, by a well-known Dutch geologist.
- President's Water Resources Policy Commission, *A Water Policy for the American People*, 3 vol. (Superintendent of Documents, Washington, 1950), contains valuable information on the U.S. water problem as a whole.
- Report of Presidential Advisory Committee on Water Resources Policy, house document 315, 84th congress, 2nd session (1956), an excellent brief discussion of leading problems of water supply and utilization in the United States, by a committee of three cabinet members.
- Report of the Task Force on Water Resources and Power of the Commission on Organization of the Executive Branch of the Government (second Hoover Commission), 3 vol. (1955)—this report is obtainable, together with the commission's report to congress, from the Superintendent of Documents, Washington.
- U.S. Department of Agriculture, *Water, The 1955 Yearbook of Agriculture* (Superintendent of Documents, Washington), perhaps the most valuable single volume ever prepared on the subject, for the nontechnical reader.

Technical

- Colman, E. A., *Vegetation and Watershed Management*, sponsored by the Conservation Foundation (Ronald Press Company, New York, 1953).
- Ellis, Cecil B., *Fresh Water From the Ocean*, sponsored by the Conservation Foundation (Ronald Press Company, New York, 1954).
- Foster, Edgar E., *Rainfall and Runoff* (Macmillan Company, New York, 1948).
- Hoyt, William G., and Langbein, Walter B., *Floods* (Princeton University Press, Princeton, 1955).
- Huffman, Ray E., *Irrigation Development and Public Water Policy* (Ronald Press Company, New York, 1953).
- Johnstone, Don, and Cross, William P., *Elements of Applied Hydrology* (Ronald Press Company, New York, 1949).
- Lane, Ferdinand C., *Earth's Grandest Rivers* (Doubleday and Company, Garden City, 1952).
- Lane, Ferdinand C., *The World's Great Lakes* (Doubleday and Company, Garden City, 1952)—both Lane's volumes contain incidental information on water supply, in the United States and elsewhere.
- Leopold, Luna B., and Maddock, Thomas, Jr., *The Flood Control Controversy: Big Dams, Little Dams, and Land Management*, sponsored by the Conservation Foundation (Ronald Press Company, New York, 1954).
- Linsley, Ray K., Jr., Kohler, Max A., and Paulhus, Joseph L. H., *Applied Hydrology* (McGraw-Hill Book Company, New York, 1949).
- Maas, Arthur, *Muddy Waters, the Army Engineers and the Nation's Rivers* (Harvard University Press, Cambridge, Mass., 1951), an analysis, in places unsparring, of the nation's flood-control and navigation policies over 150 years.
- Peterson, Elmer, *Big Dam Foolishness* (Devin-Adair Company, New York, 1954)—well-known crusader for upstream rather than downstream water control has his say.
- Steel, Ernest W., *Water Supply and Sewerage* (McGraw-Hill Book Company, New York, 1938).
- Sverdrup, H. U., Johnson, Martin W., and Fleming, Richard H., *The Oceans* (Prentice-Hall, Inc., New York, 1942).
- Thomas, Harold E., *Conservation of Ground Water*, sponsored by the Conservation Foundation (McGraw-Hill Book Company, Inc., New York, 1951)—the authoritative work on ground water (many papers on this subject may be obtained from the U.S. Geological Survey).
- Wister, O. O., and Prater, E. F., *Hydrology* (John Wiley and Sons, Inc., New York, 1949).

Regional

- Baumhoff, Richard G., *The Dammed Missouri Valley* (Alfred Knopf, New York, 1951).
- Davis, Kenneth S., *River on the Rampage* (Doubleday and Company, Inc., Garden City, 1953), the story of the Great Plains flood of 1951 and the lessons to be learned from it.
- Kraenzel, Karl Frederick, *The Great Plains in Transition* (University of Oklahoma Press, Norman, 1955).
- Nadeau, Remi A., *The Water-Seekers* (Doubleday and Company, Inc., Garden City, 1950), the struggle over the Colorado river from the California viewpoint.
- Saunderson, Mont H., *Western Land and Water Use* (University of Oklahoma Press, Norman, 1950).
- Sundborg, George, *Hail Columbia* (Macmillan Company, New York, 1954), a dramatic account of the 30-year struggle for the Grand Coulee reclamation project.
- Terral, Rufus A., *The Missouri Valley* (Yale University Press, New Haven, 1947).
- Waters, Frank, *The Colorado* (Rinehart and Company, New York, 1946), one of the "Rivers of America Series," all of which throw sidelights on the subject of the nation's water supply (this one is specifically listed because the river of which it treats is the "last water-hole" of seven states).
- Williams, Albert N., *The Water and the Power* (Duell, Sloan and Pierce, Inc., New York, 1951), development of the five great rivers of the West.
- Woodbury, David O., *The Colorado Conquest* (Dodd, Mead and Company, New York, 1941), what happens when a great river breaks loose.

The Philippine Republic: A Decade of Independence

By **ALBERT RAVENHOLT**

UNITED STATES concern with the less developed countries of Asia, Africa and Latin America often assumes that Americans can make a major contribution toward their advancement. It is an assumption that merits examination in detail in this era that has seen county agents from Iowa working in India and teachers from Michigan assisting the Okinawans. More than half a century ago—long before the world had heard of Point Four and United Nations technical agencies—hundreds of American school teachers went into the barrios, or villages, of the Philippines to help the inhabitants of those Islands build a new way of life. This “experiment” has been the major intensive United States effort at helping another people achieve progress. Joined to the aspirations of the Filipinos, it led in time to the creation of the Philippine Commonwealth and the establishment of the independent Republic of the Philippines in 1946. Now ten years after the birth of this new nation it is possible to distinguish the first beginnings of Filipino achievements under their own leadership, some of the problems that lie ahead and the extent to which they have found useful their co-operation with Americans and others.

ALBERT RAVENHOLT, the author of this article, is an associate of the American Universities Field Staff and a correspondent for the Chicago Daily News Foreign Service. His interest in the Philippines dates from his first visit there in 1940. He served as a war correspondent in the China-Burma-India Theater during World War II and saw some action by U.S. troops liberating Luzon. While covering the Far East since that war he made periodic visits to the Philippines and conducted intensive studies in the Islands in 1953, 1955 and 1956.

The author is much indebted to the dean of American scholars on the Philippines, Dr. H. Otley Beyer, who gave generously of his learning but is not responsible for any statements made herein.

NATIONS, like individuals, experience especially formative years, and for the Philippine republic the decade marked by its tenth anniversary on July 4, 1956, was such an era. It was a time of trial for Filipinos, whose independence from the United States came as they were emerging from the ruins World War II had left them. Pent-up desires from years of Japanese occupation and privation were indulged in a heavy buying spree made possible by guerrilla back pay and war damage and other payments from the United States totalling almost \$2,000,000,000. But wrist watches and new automobiles reaching Manila failed to still smouldering discontent among the ordinary rural folk, who were bound by an often primitive agriculture and an archaic land tenure system. Exploiting this raw material and using arms the war had left behind, the Communist Hukbalahap leaders staged a rebellion and for a time set aside government in large sections of the main island of Luzon. The resistance legacy of defying authority also led politicians in the capital to flaunt their corruption and encouraged the little man who could get away with it. These elements all conspired to subvert for their own ends governmental administration and the electoral process.

The decade was equally one of triumph for the young republic of the Pacific tropics. Confronted for the first time in more than four centuries with the opportunity and need to make decisions fully their own, Filipinos showed commendable good sense. Most

of them channelled their dissatisfaction with the character of government into creative political action, and the ballot box became the instrument for change. In re-establishing rule by law and by fairly chosen representatives, the nation began to discover that its democracy must also be economic and social. While workable solutions proved elusive, a new generation of leaders emerged who expressed the acute “felt needs” of average citizens, including a president of rare energy, Ramón Magsaysay. Divisive issues concerning the role of religion in schools and politics and the right of “alien” Chinese to do business tested the tolerance of these people. It was a period when the “mould was being set” within which Filipinos would evolve their national destiny.

Among the new nations struggling for self-realization in the teeming world of south and east Asia the Philippines has a special place. Because it is the only predominantly Christian country in this region and its people have borrowed much of their practices of government and life from Spain and the United States, the island republic is watched critically by its Asian neighbours who now are choosing their styles in political fashions. Its strategic role is attested by the presence of some of the largest United States naval and air bases in the Pacific.

The great natural wealth of land, minerals and timber of the Islands could promise a bountiful future for Filipinos and help fill the urgent needs for raw materials of such overcrowded industrial societies as Japan. In the insistent councils of the countries newly liberated from colonialism, the Filipinos are becoming a moderating influence that may help bridge the gulf of bitter experience dividing East and West.

While filling this unique role, the Philippines remains a land of great contrasts. Greater Manila with its 2,500,000 residents is home to more than one out of every ten Filipinos. It is a 20th-century metropolis complete with air-conditioned hotels along Dewey boulevard, plush motion-picture theatres, supermarkets and traffic jams. Only 30 miles distant, within sight of this sprawling port city, are the unexplored jungles of the Sierra Madre. On the 158,000-ac. Clark Air Force Base—Fort Stotsenburg military reservation in central Luzon, where the U.S. air force bases its jet fighter planes and B-52 intercontinental bombers, Negrito tribesmen still hunt with their bows and poisoned arrows. The Quezon City millionaire with his palatial Spanish-style home, swimming pool and Cadillac in Manila's suburb feels little in common with the ordinary *tao*, or peasant, who usually lives in a one- or two-room bamboo house, perched on stilts and thatched with leaves

Above: Primitive Igorot hunter of northern Luzon

LAND OF CONTRASTS

Below: Typical thatched-roof houses of Philippine rural areas

Above: A Filipino farmer working his field with carabao-drawn plow across the street from a modern petroleum refinery

Below: The water front of Manila, capital of the Philippines and one of the most modern cities of the East

of the nipa palm. Moro sultans of the Sulu archipelago and Lake Lanao plateau who make pilgrimages to Mecca are scornful of the predominantly Christian Filipino community, most of which looks to Rome. While English is the chief language of government and education, 70 different mother tongues are spoken throughout this geographically fragmented country of more than 7,000 beautiful islands that extend for 1,200 miles between Formosa and Borneo.

Ten years after the Stars and Stripes were hauled down over these islands, Filipinos and their friends are taking stock of what independence so far has meant. They are concerned with how well Filipinos have succeeded in welding a nation from such diverse components. How has democracy fared in the land where the United States sought for nearly half a century to implant its ideas of government? What does the Philippine experience mean for the future of this region of Asia and the Pacific where live the world's great majority of awakening and uncommitted peoples? Can Americans and others learn guides to action in co-operating with less-developed countries by examining here the handiwork in nation building? Before considering these questions we will review briefly the history of this land and its people that provides the stuff with which Filipinos are working.

The Island World

Few people are more the creatures of their geography than the Filipinos, and the republic they are building is profoundly influenced by its setting and physical character. Filipino temperament, customs, problems and aspirations are conditioned by the land where they have taken form. And their relationship with Japanese, Chinese and other neighbours in part reflects nature's great bounty to the Philippines.

Together with Formosa on the north and neighbouring Indonesia on the south, the Philippines in ancient times were looked upon as a world by themselves. It was first brought to the knowledge of Europeans in the 13th century by the traveller Marco Polo, who speaks of the eastern part of the China sea as "containing 7,459 islands" and being frequented by many Chinese and Arab ships and merchant traders "who spend their lives in navigating that sea." This first account is so informative that another paragraph may be quoted:

Within this sea there are innumerable islands, almost all well-peopled, and in these is found a great quantity of gold dust which is collected from the sea where the rivers discharge. There is copper also and other things that are peculiar to their respective islands.

They have also a traffic with the people of the Mainland, selling them gold and copper and other things, and purchasing, in turn, what they stand in need of. In the greater part of these islands, plenty of grain grows. This sea is so great and inhabited by so many people that it seems like a world in itself.

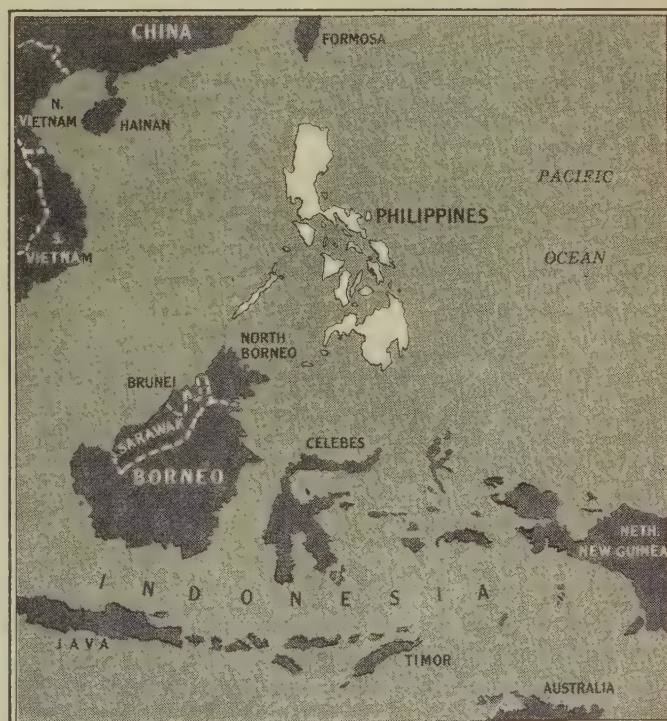

Actually, by modern count, the Philippines alone have 7,100 islands. They lie between the 5th and 20th parallels of latitude north guarding southeast Asia from the Pacific. In total area occupied the archipelago covers about 700,000 sq.mi., of which about 115,600 sq.mi. is actual land surface. It roughly equals in size the British Isles or the New England states and New York combined. The Islands have a total coast line almost as long as that of the United States. It is a land of bold topographical variety and brilliant colour contrasts; the dark green of the tropical forests and the pattern of the coconut palms is silhouetted against gleaming white and black sand beaches and emerald waters so clear it is often possible to see to a depth of 60 or 70 ft. Nearly two-thirds of the land is on the two largest islands which form the northern and southern anchors of the archipelago—Luzon and Mindanao. Luzon is dominated in the north by high, rugged mountains reaching to nearly 10,000 ft. and the cordillera of the Sierra Madre along the east coast that often drops straight into the Pacific. These ranges break down to form the narrow and periodically dry northwestern Ilocos coastal strip and the north-

eastern Cagayan river valley, where rigs now are drilling for oil. The intensively cultivated central Luzon "rice basket" or plain begins at Lingayen gulf and opens onto Manila bay and its extensive fresh-water neighbour, Laguna de Bay. On the southerly Bicol peninsula is one of the most perfect volcanic cones found anywhere in the world, Mt. Mayon, easily seen from the old port of Legaspi.

Mindanao, the "frontier" island to the south, is believed by some scientists to be comprised of five separate islands that merged through geologic action. Two 10,000-ft. volcanic formations dominate it: Mt. Apo, in the southeast, and Mt. Ragang, not far from the 2,200-ft.-high Lake Lanao which fills the cone of an enormous extinct volcano. Other smaller and usually inactive volcanoes throughout Mindanao add their profiles to the landscape. Two areas particularly attract Westerners—the cool uplands of Lanao and the rolling grasslands of the Bukidnon plateau, which are among the finest examples of tropical highlands. In northeastern Mindanao the lush Agusan river valley is now being developed, and in the south-central section the wide and fertile Cotabato plain offers a tempting opportunity for pioneers.

Nine other islands of principal importance to the Philippines range in size from 1,250 to 5,000 sq.mi. each. These include the coconut-producing islands of Leyte and Samar, where liberating United States forces landed in 1944. Cebu, the long, narrow "central island," lifts its almost treeless, razor-backed ridges out of shallow seas. Bohol nearby is dotted with curious limestone mounds. Sugar-rich Negros is dominated by its volcanic skyline, the largest formation of which is Mt. Canlaon, intermittently still active. Panay and Masbate have rolling landscapes that are largely grassland. Less well-explored are Mindoro and Palawan with their extinct volcanoes forming the backbone of islands that face the South China sea. Another 455 islands range in size from 1 to 500 sq.mi. each. The Philippines also has often beautifully sculptured smaller islands, few of them measured as to actual size, which are of so little significance to the life of the country that about 4,000 of them have never been given names.

Although connected to the Asian mainland by land bridges most recently during the Ice Age (Pleistocene), the Philippine

THE PHILIPPINES AND NEIGHBOURING COUNTRIES

MT. MAYON, one of the most perfectly shaped volcanoes in the world, rising more than 7,900 ft. above the port of Legaspi, Luzon Island

Islands, except Palawan and its smaller neighbours, do not constitute a true extension of the Asiatic continental shelf. The Islands are the higher portions of a partly submerged mountain mass of tectonic and volcanic origin; they were lifted up from the ocean floor as crests of anticlinal folds and as upthrust blocks caused by faulting, or formed from ashes and lavas spewed forth from numerous volcanoes. The process still goes on. More than 40 volcanoes today are more or less active. New islands are being thrust up out of the Pacific ocean and sometimes recede again. Others are being enlarged as the volcanic debris is carried down by streams and deposited near the periphery.

Luzon, Mindanao and Panay are continental type formations; they have coastal ranges that reach considerable altitudes, interior valleys and, consequently, substantial rivers. The other eight large islands lack significant rivers and must be classed as true islands. It is the submerged land masses and craters near the surface in the intervening seas between these large islands that have provided the foundation for the growth of numerous coral islands, atolls and fringing reefs.

The Philippines occupy probably the sharpest break anywhere on the earth's surface. To the southeast is the Mindanao deep, where water extends down about seven miles from the surface of the ocean. Nearby mountains of eastern Mindanao rise to almost two miles. Like other islands on the western rim of the Pacific from Japan to New Guinea, the Philippines experience violent activity in the earth's crust, and earthquakes regularly shatter this part of the world. Over eons of time, the process has created scores of fault lines, some running through the entire archipelago. A sector of one of the largest can be seen in the bottom of Ragay gulf off southern Luzon from planes flying at an altitude of 2,000 to 3,000 ft. It is this extensive faulting and shattering of the land masses that has given the Islands their numerous mineralized veins. Rich deposits of copper, gold, silver, lead, zinc and other minerals are some of the major and, so far, little-explored sources of natural wealth for this young republic.

Extensive prehistoric and recent volcanic activity has provided the Philippines with some of the finest soils on the planet. Unlike

many tropical soils, such as those of the Congo and the Amazon river valley, that have lost much fertility through leaching, the Philippines have much soil still sufficiently new to have retained most of the mineral elements disgorged by volcanoes or deposited in alluvial formations. There are perhaps 30,000,000 ac. of arable land, of which an estimated 16,500,000 ac. is now cultivated.

Over the Philippines the normally light to moderate winds carry moisture throughout most of the year, providing a heavy rainfall usually in the form of intense showers. Of prime importance are the monsoons. During the summer months the monsoon winds move in from the southwest, bringing rain to the western sides of the Islands, and during winter months the northeast monsoon waters the eastern slopes. Interior valleys have less pronounced seasons and some moisture throughout the year. Nature's wrath is most felt when typhoons strike, often with centre winds of more than 100 m.p.h. Typhoons regularly sweep from the areas of the Pacific around Guam westward against or near the Philippines. Then they pass on north and west to strike other island areas of Okinawa and Formosa, and sometimes spend themselves on the China coast. With them come drenching downpours, the summer capital of Baguio, nearly a mile above sea level in northern Luzon, having recorded up to 47 in. of rainfall in 24 hours.

These influences of soil and weather combine with warm sunshine to give the Philippines an exceptionally varied flora and fauna. More than half the land area is covered with rich forests and dense jungles that reach in places from the water's edge to the crests of the mountains. The stand of timber is estimated at 446,000,000,000 bd.ft. and is possibly the greatest single natural resource of the republic. There are about 65 commercial species of timber including those now finding favour abroad under the name of Philippine mahogany. The broken surface of the Islands has encouraged a diversity of climate and a rich differentiation among the species. Approximately 1,000 native orchids have so far been identified, and more than 15,000 flowering plants.

THE SINIGUELES, a tropical fruit tree of the cashew family. Before budding and producing its fruit, the *siniguel* sheds its leaves, thus appearing barren at the moment of its greatest activity. The sweet, juicy fruit is relished by Filipinos

The Islands once were inhabited by the larger forms of wild animal life characteristic of mainland Asia, including elephants and rhinoceros. But these have become extinct. The only large wild animals presently found are the fierce cattle, or tamarao, on Mindoro and a wild buffalo not much different in appearance from the domesticated carabao. Prevalent throughout the Islands is the wild pig, a curse to the farmer, particularly on the frontiers. Small deer are found in abundance in uninhabited areas. Snakes range from pythons that have been measured up to lengths of 34 ft. to cobras with poisonous venom, and sea snakes are plentiful. Among the 750 species of birds are some of brilliant plumage, and the famed monkey-eating eagle.

Sea life includes the dugong, or sea cow, a tropical mammal whose body sometimes measures 12 ft. in length. There are giant sting rays, up to 17 ft. across, much feared by fisher folk. More than 2,400 different species of fish have been identified, including many of commercial interest as well as the smallest found in the world, *Pondoka pygmaea*. Within the Sulu sea are islands noted for the millions of eggs of the green turtle *Chelonia mydas*, gathered there annually. Nearby are the Snake Islands, reputed to be those visited by Sinbad the Sailor in his travels as recounted in the *Arabian Nights*. There serpents from the South China sea come in to lay their eggs in such profusion that snakes are every-

CARABAOS wallowing in a Luzon mud hole. The carabao, a domesticated water buffalo, is the principal work animal of the Philippines

where within a few feet of each other. Not far away lie the oyster beds that are famed for producing the Sulu pearls.

From the Philippine region come many of the waters that join to form the Japan current and move across the North Pacific and down along the western coast of North America. Filipinos with some justice can claim that the salubrious climate which makes possible present forms of life and habitation from British Columbia to northern California depends in no small measure upon heat the sun deposits on the Philippine seas.

The Filipino People

Throughout this archipelago today live nearly 22,000,000 Filipinos, and their numbers are increasing at the rate of approximately 500,000 annually. One out of every ten is resident in Manila and its suburbs—the buoyant commercial, political, cultural and educational capital of the republic where important careers and decisions usually are made. Most Filipinos, however, live scattered throughout about 800 of the larger inhabited islands; a small proportion dwell in provincial towns and ports, but Juan de la Cruz, or Mr. Average Citizen, resides in one of about 20,000 barrios, or rural communities. This population is concentrated in two regions. The central Luzon plain stretching north from Manila bay is overcrowded, as are portions of neighbouring Batangas and Laguna provinces and sections of the Bicol peninsula to the south. The densest inhabited area is along the narrow Ilocos coast—the province of La Union has 1,400 residents per square mile. The second major grouping of people is in the central Visayan Islands, particularly on Cebu, Bohol, Leyte, Siquijor, Negros and portions of Panay and Masbate. Cebu, for example, with approximately 700 sq.mi. of land area, is home to considerably more than 1,000,000 persons. It is from these two areas of primary population concentration that have come the tens of thousands of Filipinos who opened new lands on neighbouring islands or migrated to Hawaii and the continental United States.

Much sparsely settled land remains, however, and it is estimated that with proper development the Philippines could support five times its present population at a higher standard of living than at present.

Citizens of this republic are evolving into a new ethnic type that some anthropologists have named the "Filipino blend." It is a mingling of the many peoples that over the centuries migrated into the Philippine Islands, and combines characteristics of major ethnic stocks including the Mongoloid, the Caucasian and a little of the Negroid. The first known human inhabitant of the Philippine Islands lived about 250,000 years ago—a primitive type similar to the Java man. His stone implements have been found in Rizal, Bulacan and Batangas provinces. This early man, accompanied by the *Stegodon* elephant and the rhinoceros, had wandered in over the land bridges that then connected the Philippines with Borneo, Sumatra, the present area of Malaya and the Asian mainland. He became extinct, so far as scientists can judge, before the time of the last glacial period, coincident with the disappearance of most large mammals.

The earliest ancestors of the present Filipinos reached these islands about 25,000 to 30,000 years ago, also arriving over the land bridges. They were the dark-skinned ancestors of the present pygmy Negritos, whose adult men stand to a height of from 3 ft. 10 in. to 4 ft. 8 in. Another migration of people followed about 10,000 to 15,000 years ago over the same land bridges—a Proto-Malay or short Mongoloid people. They possessed the blowgun and bows and arrows and practised a crude kind of dry agriculture in forest clearings. Shelters of tree branches and leaves were built by them, and they probably wore primitive clothing and ornaments made of barks and leaves. Anthropologists have estimated that together these two migrations contrib-

uted perhaps 10% of the blood strain of the present Filipino population.

The first seafarers of which there is record crossed the horizon of Philippine history from the north about 5,000 to 6,000 years ago. They had learned to make and sail sturdy plank boats. These early New Stone Age people carried polished stone axes, chisels and other tools which tell, archaeologically, of an advanced culture and craftsmanship. They practised dry agriculture, constructed rock and stone walls around their homes and lived in grass-covered houses with wooden frames and rounded roofs, much like a modern Quonset hut, built directly on the ground over yard-deep pits. These early Neolithic or Indonesian "A" men were tall and slender and added an estimated 12% of the present stock.

A second wave of immigrant seafarers started arriving about 2000 or 1500 B.C. from Indochina and south China, and their influx continued for perhaps a millennium. This is known as the Indonesian "B" or late Neolithic migration, and it contributed roughly another 18% of the "ethnic mixture." Between 800 and 500 B.C. a smaller migration with a Copper-Bronze culture arrived. They also carried jade and small tools and introduced irrigated rice culture, building the first terraces, but contributed at most 3% toward the ancestry of the present population.

The last prehistoric migration, occurring between 300 and 200 B.C., brought from the south the most numerous and advanced influx, the Malays with their Iron Age civilization. They are responsible for an estimated 37% of today's ethnic composite. These people travelled in fleets of dugout boats from the west coast of Borneo to Luzon by way of Palawan and Mindoro, and along the Sulu Islands to Mindanao and the Visayas. In addition to advanced lowland agriculture, they introduced new industries such as pottery-making, weaving, glass and metalworking and the manufacture of improved tools and weapons.

The blood strain was also enriched in historic times. Arab and Indian merchants reached the Philippines about the beginning of the Christian era and continued to trade throughout these waters, and occasionally settle on the islands, for almost 1,000 years. They were followed by the Chinese, who, beginning with the southern Sung dynasty in 1127, developed extensive trade with southeast Asia, particularly with the Philippines, coming in search of rare woods, rattan, pearls, cotton and prize delicacies such as bird's-nests. The Chinese established colonies along the coast and later in the cities and left their ethnic stamp upon the population. With the arrival of the Spanish and Americans, a substantial Caucasian element was introduced. Altogether ethnologists estimate these historic arrivals have added perhaps 20% to the present blood stock of the Filipino people.

This varied ancestry is reflected in today's Filipino; while generally brown-skinned and of medium stature, he is not true to a single physical type. Most men and women have straight black hair, typical of the Mongoloid or Malay. But some families have children with long wavy locks characteristic of the Indian or Spanish, and, occasionally, a head of tight black curls suggests

some Negroid ancestry. The comparatively light skin found in many families and admired by Filipinos in their babies is usually indicative of European progenitors. There is evidence of hybrid vigour, particularly among the men. Folklore holds that certain ethnic mixtures have greater prospects of success in life. For example, a wealthy man who has made and kept his money is usually credited with a strain of Chinese blood. Blending of the races in these islands produced women who, by Western standards, are judged among the most attractive in Asia. They have the small bones of the oriental but with the fuller figures and sharper facial features the West admires.

The complex origin of the present Filipino people is manifested by the numerous native languages now in use. There are about 55 different ethnographic groups speaking a total of 70 or more languages and dialects that divide into 137 subdialects. These languages emerged as the successive waves of immigrants to the Philippines added their forms of speech to those of the earlier inhabitants, and verbal differentiation resulted as settlers on an island or in an isolated mountain valley evolved terms to fit their particular environment.

However, today about 88% of the population has, as a mother

THE FILIPINO, a blend of many ethnic stocks. On the following pages are photographs of the modern Filipino and of some of the native ethnic groups within the Philippines

tongue, one of the eight principal native languages, for which there is a limited written literature.

Minorities

The influx into the Philippines of numerous peoples and cultures from the neighbouring islands and the Asian mainland, and their relative geographic isolation, has left substantial minorities that have not yet been integrated into the society of the republic. Almost one-half of these are known as pagans or have been improperly termed "wild peoples." The largest communities are in the Mountain province and Abra in northern Luzon and in the interior of Mindanao, Palawan and Mindoro. There are about 250,000 Igorots, Ifugaos, Bontocs and other tribal groups that have inhabited the highland areas of northern Luzon since the beginning of historic times and developed a distinctive culture notable for its terraced rice paddies extending up the sides of mountains. These terraces were laboriously built by one generation after another, and some of the walls that hold the soil rise from 10 to 40 ft.

Another class of pagan peoples is known as the "shifting dry

WOMAN AND CHILD of San Luis, a rural village in Pampanga province, central Luzon

agriculture, hunting and fishing groups" of eastern Mindanao, Mindoro and Palawan. Living in remote forests, they clear and burn the trees and the brush and plant crops in between the stumps. The soil becomes depleted after a few years, since they know little modern agriculture, and the village moves to a new site. A community usually makes three or four such moves in a generation. In Mindanao the most numerous are the Manobos, who number perhaps 75,000 in the east central region, formerly distinguished as head-hunters but now relatively peaceful. Other small pagan communities are scattered through Davao, Cotabato and the Zamboanga peninsula. In northern Luzon there are also the Apayaos and Eastern Kalingas, and in Nueva Vizcaya the Ilongots who belong to the shifting dry agriculture groups. They are distinguished for their artistry in ornament and picturesque clothing.

Deep in the forests of Luzon, Negros and Panay live remnants of a third group of timid, wandering tribal people who subsist chiefly on wild fruits that grow in the jungles, such as bananas, and the occasional fish, fowl and small wild animals that they are able to trap or to bring down with their primitive weapons. Most prominent among these shy people who shun civilization are the Negritos, who live today much as their ancestors did when they first reached the Philippines.

Sea Gypsies, otherwise known as the Badjaos, form a unique minority in the Sulu archipelago. They number several thousand and spend their entire lives on their houseboats, each of which holds two families. They live by fishing, by searching for turtle

eggs and by trading with land people for their other needs, sometimes moving their entire boat villages overnight when danger threatens or fishing lures them elsewhere. Altogether, these pagan peoples in the Philippines number more than 800,000. They are separate from Philippine society, do not benefit significantly from government services, nor do they share to any important extent in the decision-making processes of the republic.

An even larger minority comprises the Mohammedan Moros, who dominate the areas of southwestern Mindanao and the Sulu archipelago. The several ethnic groups among them include the Tao Suug people, or Land Moros, of Sulu and the Sea Moros, or Samals, whose craft ply the swift currents among the coral reefs and coconut palm-shaded isles. On the Lanao plateau live the Maranaos, and to the south in the huge province of Cotabato are the Magindanaos. For these Moslems, religion is the centre of their lives. It moulds their social customs, sustains the class system and conditions relations with the rest of the Filipinos. Moro communities are still run by hierarchies of *datus* and sultans whose powers are reinforced by tradition, extensive "clan" relationships and the religious courts. The ordinary Moro shuns the Philippine civil courts established in the capitals of these provinces and some of the larger towns. A Moro feels his land was given him by God and, as a consequence, many have refused to register their property with the Philippine government and secure titles to it. They become easy victims of outsiders and some unscrupulous *datus* who claim their land and are awarded legal title. This struggle over land, particularly when Christian settlers open new areas that the Moros claim by hereditary right, often leads to bitter and bloody feuds. The difficulty arises in part from the government's failure to recognize the Moro type of communal land ownership.

Moros have rarely had much modern education, since their parents feared that this might lead to Christianization. As a consequence, there are few doctors, nurses and teachers to help elevate the Moro ways of life. Sanitation and health are primitive and infant mortality is high. Ancient feudal customs still are in force, including slavery. On the Lanao plateau, where some families own up to 50 "slaves" each, these usually were purchased as small children or were captured from neighbouring Christian communities during World War II.

The young Moro today is torn between allegiance to values of the past and the present. Among the Maranaos, for example, he seeks to become an expert chess player, learns to sing the ancient *darangan*, or warrior ballads, and often carries a .45-calibre pistol instead of a kris. While he learns to recite the Koran in Arabic, he may understand little of its meaning. And none of these skills equip him to compete in the modern economic community whose products he increasingly craves. Only in Cotabato do the Moros, to any important extent, intermarry with the Christians. In the Lanao area and the Sulu archipelago, the Moros continue to hold themselves apart. However, they are becoming politically conscious. A number of Moro leaders now sit in the Congress in Manila where the politicians are beginning to recognize Filipino Moslems as a potent minority determined to protect its particular interests.

Filipino Christians

About 90% of all Filipinos are Christian, and these are the chief concern of this article; it is they who shape the young republic and give it its special character. Like their pagan and Moslem neighbours, these Christian Filipinos have never known the necessity for planning ahead and saving to survive through the winter. A "discipline of nature" more moderate than that felt by peoples in temperate zones has given an optimistic and less methodical cast to the national outlook. Equally important, Filipinos never have experienced the grinding competition for

THE PEOPLE

About 55 ethnographic groups inhabit the Philippines. Approximately 88% of the population is composed of eight large ethno-linguistic groups: Tagalog, Iloco, Bikol, Pampangan, Pangasinan, Cebuano, Hiligaynon and Waray-Waray. Members of these groups form the typical "Filipino." Among the pagan and primitive groups are descendants of racial migrations of 25,000-30,000 years ago; their way of life is not much changed from that of their ancestors.

survival as it is known in overpopulated countries such as Japan, China or India, where the spectre of famine periodically has emphasized the price of failure or misfortune. Although the Filipinos have a rare talent for learning rapidly, the multiplicity of languages has combined with this influence of geography to discourage verbal exactness and foster in them a casual attitude toward life in general.

Filipinos as a result are lighthearted and carefree to an extent seldom found in other people. Their hospitality is almost boundless. Basic social obligations dictate that a Filipino who is employed frequently supports his less fortunate or less energetic relatives for years without complaint. Dignity and self-respect are found among even the simplest folk, and they are ready to do favours for those with whom they come in contact. They are attached to their children and to the home, where the wife is a dominating and conservative influence; the ordinary Filipino husband usually gives his wife all the money he earns, for her to manage, and receives an allowance for his personal use which he may bet on cockfighting, spend on *tuba*, the fermented juice of the coconut palm, or lend to his friends.

Heritage From Spain

These Christian Filipinos are heirs to the "most effective large scale European missionary enterprise in the Orient." It was this work, continued through more than three centuries of Spanish rule followed by a half-century under the United States flag, that so fundamentally sets the Philippines apart from the rest of Asia. Christianity and other values and Western institutions brought from Europe and the United States have been superimposed upon the native customs and beliefs and have caused the nation now emerging to become an amalgam of East and West.

When the Spanish colonizers under Miguel López de Legaspi began occupying the Philippines some years after Ferdinand Magellan's discovery of the Islands in March 1521, they hoped

SAN AGUSTIN CHURCH, built by the Spanish in the 16th century, the only church inside the old walled city of Intramuros not destroyed during World War II

to find wealth in gold and silver as the *conquistadores* had done in Mexico and Peru. Disappointed in this quest, the Spanish considered abandoning the Islands, fearing they would become an administrative and defensive burden. Instead, the Spanish court, with some persuasion from the religious orders, determined to keep the Philippines with the avowed purpose of Christianizing the inhabitants. This mission led to building a distinctive kind of colonial rule in which maintenance of law and order was not so much a means to economic exploitation as to conversion of the populace. The Spanish in Manila, however, did not forgo the profits of the "galleon trade" that thrived upon purchasing porcelains, silks and spices from Chinese merchants and transshipping them in the vessels that annually sailed to the west coast of Mexico, docking at the port of Acapulco.

As Spanish administration was established throughout most lowland populated areas during the 16th century, it was accompanied by thorough Christianization. In these islands there were no deeply entrenched religions comparable in sophistication with the Buddhism of China and Japan, with its corps of devout monks, to oppose the Christian missionaries. Mohammedanism, which had crept into the Philippines a century earlier, survived only in Mindanao and Sulu where the sultans and *datus* fought off the Spanish forces. And the Spanish priest in the Philippines, with his quasi-official status as the local arm of government, had many arguments to buttress his work as missionary. With conversion and baptism the Filipinos were given Christian first names and were organized into parishes; surnames only became common in the Islands in the mid-19th century, when the Spanish authorities distributed copies of the Madrid tax lists from which Filipinos, as a rule, were assigned their family names.

Most Filipinos accepted then and do today the forms of Christianity, but many of them also have retained some of their traditional beliefs in the world of numerous spirits. These include an almost infinite number of beings who live in trees, ant hills, lakes, on the land and in the air, who may be propitiated with offerings of food to ensure a plentiful harvest or a good catch of fish. Recitation of protective phrases and avoidance of places where harmful spirits are thought to reside is common, and a number of Filipinos carry *anting anting*, or charms, in which they place great trust.

Similarly, ancient practices continue alongside those introduced with Christianity. In Pangasinan province of central Luzon there are communities where a church wedding is not considered a real marriage. The bridegroom must afterward go through the traditional ritual of breaking into his father-in-law's house and with the aid of comrades forcibly carrying off his bride. Customary law likewise continues to be respected in most rural areas. While the widow is legally assured of inheritance as provided originally in Spanish law, there are sections of Ilocos where the elder son receives all property and is responsible for supporting the family, and neighbouring regions where the youngest son acquires all the wealth. A barrio resident who seeks the advantages of statutory law becomes an outcast in many communities.

Along with Christianity the priests brought Westernization. Symbolic of this is the plaza which today is the centre of life in the more than 1,200 *poblaciones* that are the seats of government for the municipalities, or Philippine equivalent of counties in the United States. A site was chosen along the projected route of the King's highway. Along one side of the square was constructed the church, usually patterned on mediaeval European architecture with massive stone buttresses to withstand the frequent earthquakes. Across the plaza government offices were erected which today are headquarters for the municipal mayor and his councillors. Prominent citizens were encouraged to build their homes around this setting, which became the scene of the annual fiesta celebrated in honour of the saint to whose patronage

TERRACED RICE FIELDS of Luzon. Rice is the principal staple food and major farm crop of the Philippines

the community had committed itself. Among the wealthy, dress and eating habits were equally Europeanized. Ordinary Filipinos continue to eat with their fingers, and one requirement of a successful politician today is that he must be known as a man who does not need a knife and fork. The Spanish priests were conscientious in erasing all vestiges of pre-Spanish literature, as part of what they considered their Christian duty. Since the church had control over education the Spanish language became a common tool for communication among the few who were schooled. European values of that time found a place in the Philippines, including the Spanish regard for the *ilustrado* class, or gentlemen of letters and leisure. The energetic work of the priests for the first time gave the Filipinos a sense of a larger unity that reached beyond clan and local chieftain to include other men of like habits and tastes—particularly among prominent land-owning gentry—in neighbouring provinces or islands.

This comparatively creative role of the Roman Catholic Church in the Philippines was reversed after the British occupation of the Islands between 1762 and 1764, and from the experiences of the subsequent period stems the anticlericalism, largely imported from Europe, that is a vital factor in modern Filipino life. As the Spanish civilian and military authorities sought to end the participation by the clergy in administration, the friar orders, including the Recollects, Dominicans and Franciscans, turned increasingly to economic pursuits to support their religious efforts. On their large landed estates they pioneered in introducing many of the crops that now are important. Corn, potatoes and cassava were brought from Central America, the coconut was introduced for commercial cultivation, and the sugar industry was launched primarily through the efforts of the priests. But as the religious orders became wealthy the priests lost direct touch with the people, who often became merely tenants and workers. The Philippines were remote from Spain, particularly before 1819 when they were administered from Mexico, and they served as a convenient place to send persons not wanted

closer to home. In time, some of the priests became corrupted, partly because the church in the Philippines was largely unaffected by the intellectual movements in Spain and other areas of western Europe. However, the religious and civilizing influence of the church ensured the unique status of the Philippines in the Far East.

While the Roman Catholic Church became an increasingly conservative influence in the Islands, Filipinos began to sense the 19th-century European liberalism. Opening of the port of Manila to world trade in 1837 brought prosperity based on production of hemp, sugar and, for a time, coffee. This new wealth enabled young Filipinos to study in Europe, and they were soon caught up in the heady intellectual atmosphere of the day. From these European contacts emerged the Masonic movement in the Philippines, encouraged initially by Spanish intellectuals who saw it as an instrument for curtailing and modifying church influence. For Filipinos it became a popular and influential fellowship. Almost inevitably Filipinos demanded reforms that the Spanish administration refused. A succession of revolts resulted. Following the execution in 1872 of three Filipino priests who had demanded equal opportunities with Europeans, nationalism also began to stir within the ranks of the Filipino clergy. In Dec. 1896 when the Spanish executed the gifted doctor, writer and sculptor José Rizal y Mercado for alleged complicity in the uprising the previous August, they created a martyr who remains today the pre-eminent Filipino national hero. But Rizal's great novels of protest were written in Spanish, and like most of his revolutionary colleagues he was more European than Asian in his thinking.

The United States Influence

Filipinos are even more firmly linked to much that is American by the adventure in sharing democratic ways which began when

HOME OF JOSÉ RIZAL (1861–96), national hero of the Philippines. The house was rebuilt in 1951 and opened to the public as a shrine

Commodore George Dewey's ships sank the Spanish squadron in Manila bay on the morning of May 1, 1898. During the early years after the United States replaced Spain as the colonial power in the Islands and firmly put down the Filipino revolutionary forces, there was much suspicion, not only among the Spanish-educated élite, of the new regime that professed such high ideals. Today there are very few Filipinos who do not concede that their republic has far greater prospects of meeting the aspirations of its citizens than it would have possessed if launched on its own at the beginning of the century. And there are some who nostalgically wish that they were back under the protection of the Stars and Stripes. Their regard reflects the achievements of the United States administration, which encouraged the essential framework on which this new nation is erected. Filipinos generally have been charitable about the handicaps left them by that administration.

Few papers of state compare in breadth of concept with Pres. William McKinley's instructions to the second Philippine commission that established civil government in the Islands on July 4, 1901. One paragraph gives the tone of this assignment:

In all forms of government and administrative provisions which they are authorized to prescribe, the Commission should bear in mind that the government which they are establishing is designed not for our satisfaction or for the expression of our theoretical views, but for the happiness, peace and prosperity of the people of the Philippine Islands, and the measures adopted should be made to conform to their customs, their habits, and even their prejudices, to the fullest extent consistent with the accomplishment of the indispensable requisites of just and effective government. At the same time the Commission should bear in mind, and the people of the Islands should be made plainly to understand, that there are certain great principles of government which have been made the basis of our governmental system, which we deem essential to the rule of law and the maintenance of individual freedom, and of which they have, unfortunately, been denied the experience possessed by us; that there are also certain practical rules of government which we have found to be essential to the preservation of these great principles of liberty and law, and that these principles and these rules of government must be established and maintained in their islands for the sake of their liberty and happiness, however much they may conflict with the customs or laws of procedure with which they are familiar. It is evident that the most enlightened thought of the Philippine Islands fully appreciates the importance of these principles and rules, and they will inevitably within a short time command universal assent. . . .

The Americans who accepted this challenge came fresh from the labours of opening a continent. They possessed an almost unbounded faith in the worth of the solutions the United States had employed domestically. While the folks at home debated and fought political campaigns about whether a union of states based upon representative authority had any right to "get involved in the business of imperialism," the Americans in the Philippine Islands soon built an administration that was a model for its time.

Once order was re-established, public health measures soon followed, giving the cities clean drinking water, curtailing the epidemics of cholera that periodically had struck the populace and training officials in sanitary methods. Roads were pushed into the hinterland, and the taxes needed to pay for them and other public improvements were scrupulously collected. The legal system was remade, and Spanish procedural law was supplanted with provisions that better safeguarded the rights of the individual in keeping with the Anglo-Saxon tradition. The Roman Catholic Church was shorn of its official temporal functions, freedom of religious worship was guaranteed and the Islands were opened to missionaries of all faiths. The U.S. congress voted a special bond issue to purchase and resell to Filipinos most large landed estates of the friar orders.

A public school system based on the English language was built which proved the most pervasive of all American innovations. The first instructors were soldiers, who were joined later by nearly 1,000 teachers recruited in the United States. As Filipino teachers were trained the schools multiplied. Students enrolled in public elementary and high schools increased from about 150,000 in 1900 to more than 1,000,000 in 1921, over 2,000,000 in 1940 and more than 5,000,000 in 1956. Normal schools, trade schools and a national University of the Philippines were established. The product of this schooling was a new type of Filipino steeped in the democratic tradition and persuaded that a man of humble origins could rise by his own efforts. He had read as much about George Washington and Thomas Jefferson as about his own national heroes, and there had been opened before him the accumulated learning of the English-speaking world along with the new emphasis on liberal thinking and science.

Filipinos participated from the beginning in the process of civil government; three served on the commission headed by Gov. William Howard Taft that acted as an executive and deliberative body, and a Filipino was named chief justice of the supreme court on which sat at first a majority of Americans. In 1902 by act of the U.S. congress elective government was instituted in the municipalities. The severely restricted franchise of the Spanish period, when priests regularly counted the votes, was thereafter steadily extended. The creation in 1907 of a Philippine assembly as a lower house to which representatives were elected from most of the archipelago opened opportunities for new careers as politicians. Prestige in the community which formerly belonged almost exclusively to the landowning gentry, often known as the *hacenderos* or *caciques*—local bosses—a few literati and the clergy now was extended to a new kind of person, the "talker," who was knowledgeable about the world represented by the United States. From among this group rose leaders such as Sergio Osmeña and Manuel Quezon to champion the political struggle for independence.

The Democratic party in the United States in its search for campaign issues and in response to the promptings of many liberals had long condemned Republican management of the Philippines. After Woodrow Wilson became president in 1913 the administration in the Islands was radically revamped. Initially, there seems to have been a Democratic plan to give the Philippines independence within a few years, but this objective was modified after the outbreak of World War 1 and the discovery by Democrats appointed to Manila that their Republican predecessors had generally appraised the problems accurately and done a creditable job. However, "Filipinization" of the administration in the Islands was pushed vigorously and many able U.S. civil servants were replaced by Filipinos; in seven years the number of Americans in the insular government was reduced from 2,600 to 582. With enactment of the Jones law of 1916 the Philippines acquired an elective senate and the two houses of the legislature secured substantial control over appropriations. These reforms

inspired in part by progressive-minded Americans, both placated and encouraged Filipino nationalism. But power passed primarily to the privileged groups who had been dominant during the Spanish period—not many sons of ordinary citizens had yet been educated to compete for the more responsible posts. The quality of administration deteriorated as Filipinos took over. When the Republican party returned to power in the United States in 1921 the Wood-Forbes mission was dispatched to investigate conditions, and it recommended a tightening of control and continuation of the existing status in the Islands until Filipinos “had time to absorb and thoroughly master the powers already in their hands.” Twelve years later with the advent of the Democratic administration of Franklin D. Roosevelt, this insistence upon quality in administration was again subordinated to the demands of American liberal anticolonialism prompted by sugar, dairy and other domestic pressure groups anxious to be rid of Philippine competition. The Tydings-McDuffie act of 1934 spelled out the terms of independence: Filipinos were to manage their own domestic affairs for ten years as a commonwealth under the United States flag before achieving a separate sovereignty. The constitutional convention that met in Manila in 1934–35 framed a national government for the Islands patterned upon the division of responsibility among the executive, legislative and judiciary evolved in the United States. With the elections of Sept. 1935, Filipinos became the full masters of their own internal affairs.

While the United States concept of the role of government

proved creative politically for Filipinos, it did not take them far in solving their economic and social problems. The Payne tariff law of 1909, permitting near free trade between the Philippines and the United States, brought a rapid expansion of commerce. Industries that had flourished in the late Spanish period, such as hemp and tobacco, were re-established. Sugar production expanded rapidly after World War I, and by the early 1930s the Philippines supplied 14% of the United States’ consumption. Growth of the United States soap and vegetable oil industries encouraged the Islands to become the world’s greatest single coconut producer. And a largely U.S.-managed mining industry grew up, primarily exploiting the rich gold deposits the Spanish had overlooked. But for the majority of citizens provision of law and order and public facilities did not afford a substantial opportunity in the economy as it had in the United States; the evils of a formerly feudal society where the few owned most of the property were reinforced when the United States recognized the Spanish land grants and established courts that awarded titles to those who were informed and aggressive enough to prove their claims. As the markets filled with manufactured goods the little Filipino lost the outlets for his handicraft industries that had been such an important source of livelihood. While the Americans encouraged valuable research in tropical agriculture and built centres for training Filipinos in these skills, little of this knowledge percolated out to the ordinary *tao*, or farmer. His rice production remained static at one of the lowest yields per hectare in Asia, while the number of mouths to be fed multiplied and the owner of the hacienda, who probably had moved to the city, demanded higher rents. The resulting grievances sometimes erupted violently through the activities of quasi-religious groups. The Sakdal uprising of 1935, although linked to politics, was primarily an abortive and costly move of social protest. Except for a small Socialist movement in central Luzon and Manila, however, these organizations of Filipinos who wanted a better life were not led by men conversant with modern economic theories.

Fruits of Colonial Experience

Filipinos emerged from the centuries of foreign rule with a maturity of attitude toward their recent administrators rare among Asians who knew colonial status. Overcompensation for once injured national pride, bitterness spurred by memories of the white man’s assumed superiority of bygone days and other painful trappings of a late imperialism are rarely encountered in the Philippines. Instead, Filipinos know the Americans and the Spanish so intimately that they are quite capable of discriminating among and sometimes outwitting them while remaining friendly. Partly this results from the thoroughness with which they have accepted the values of the West—a product in some measure of the idealism that motivated many of the early Spanish and Americans who came to the Islands. Also, the “colour line” never was imposed with the rigidity characteristic of the rule of most European powers in Asia, and intermarriage among Filipinos and foreigners was commoner and more acceptable than elsewhere in the Orient. Throughout the period of United States administration no Filipino martyrs were created who suffered persecution, imprisonment and worse in the cause of independence. Rather, soon after the champions of “things Filipino” gained a political following they won significant responsibility in government. And these national leaders discovered that there was far more to be gained by befriending congressmen in Washington, D.C., and spending for the right publicity than by leading movements of protest in the hinterland of Luzon or the Visayas.

Such influences, however, might have remained of secondary importance but for traumatic experiences of World War II which impelled Filipinos to reassess their past and their prospects for independent existence.

World War II

As happened throughout the Far East where the white man's "face" crumbled before the succession of effective Japanese blows at Pearl Harbor, Hong Kong, Singapore and the Netherlands Indies, Filipinos at first found reports of these events incredible; the entrenched colonial powers had seemed so omnipotent. But the dismay felt throughout the Islands was balanced by the stubborn defense on Bataan and Corregidor of United States and Philippine forces, providing a symbol of joint resistance as Filipinos began to feel the harsh boot of the imperial Japanese army. Japanese-style independence, as expressed in the puppet government created in Manila, won the participation of most prominent Filipino leaders who had not left by submarine with commonwealth Pres. Manuel Quezon and Vice-Pres. Sergio Osmeña and their staffs; some of these leaders in Manila wanted to believe the Japanese promises, others were opportunists, and among them were statesmen who saw limited co-operation as a means of moderating the effects of occupation.

Ordinary Filipinos, accustomed to United States regard for rule by law, sanctity of the individual and protection of private property, were at first offended and then made fearful and angry by the Japanese. The occupation soldiers, conditioned through the looting and abuse of civilians by their army in China, now stole chickens, bathed naked in the streets and intimidated, beat and sometimes summarily executed Filipinos suspected of resistance. From such promptings the new Philippine guerrilla movement gathered strength. Particularly in Mindanao and on other southern islands it was encouraged and supplied by United States forces in Australia. While there were guerrilla chieftains who, once they had assembled guns and men, used them to settle old scores, establish independent domains in the hills or engage in a little banditry, the resistance denied the Japanese effective control and exploitation of the Islands away from the main cities. The guerrilla movement was of equal social consequence. The war taught the poor farmer that he was as good as the rich city dweller who came to beg his food. Amidst the turmoil of the times, social status and wealth were set aside as claims to leadership. And there were elevated from among the ranks of the common people a new generation of leaders whose capacities the guer-

rilla movement had tested and proved in action. They and the men who fought with them got a taste for life without the old inhibitions, and many acquired a new faith in the essential worth of democratic values that formerly had been more of a school-book expression.

When the United States forces returned as liberators to the Islands they achieved a symbolic stature that gave a new cast to Philippine-U.S. relations. The G.I.'s who fought their way from Leyte and Samar to Luzon in 1944 and 1945 became heroes to the village folk. While the Japanese soldier had slapped those who failed to show proper respect for the new order, young Filipinos discovered they could drink, frolic and fight with Americans and remain the best of friends. Thousands of Filipinos attached themselves to United States combat units and fought alongside them, often without pay, through the mountains. The English that Filipinos had learned from their American school-teachers now was liberally enriched with G.I. phrases, and new tastes were acquired for chewing gum, American cigarettes and travel by Jeep. And among reflective Filipinos were some who viewed the war as an object lesson and began to question their original demands for being left as a nation entirely on their own.

Independence Amidst Chaos

Formal inauguration of the Philippine republic on July 4, 1946, occurred under circumstances that could hardly have been less auspicious for its future success. The decision to sever ties with the United States as envisaged at the time of the establishment of the commonwealth was made despite the views of some sober-minded Filipinos and Americans who held that the date for granting full independence should be reconsidered as a consequence of the ravages of war. Most Filipino leaders, however, were caught in the momentum of their own lifelong championship of independence, and the United States was determined to face the rest of the world with a "clean colonial record" in a postwar era when Asia and Africa were clearly astir. As happened when the commonwealth was created, the Filipino people were afforded only an indirect voice in this decision; the issue was never put squarely to a vote. In April 1946 Filipinos had held the presidential elec-

tion that by constitutional provision was scheduled for the previous November but had been postponed because of disorder and continued resistance by scattered Japanese forces. A split in the old alignment of political leadership had led to the defeat of the incumbent Nacionalista administration and election of Manuel Roxas y Acuna as president and Elpidio Quirino as vice-president on the ticket of the new Liberal party. It was they who took oaths of office on that historic July 4 after the reading of Pres. Harry S. Truman's proclamation withdrawing United States sovereignty over the Islands and the lowering of the U.S. flag. The ceremonies were enacted on the grassy Luneta fronting on Manila bay near the spot where José Rizal had been executed. The United States was represented by High Commissioner Paul V. McNutt, General of the Army Douglas MacArthur, Sen. Millard E. Tydings and other prominent civilian and military leaders who joined with delegations from 22 other foreign countries in acclaiming the birth of this new nation. Several hundred thousand Filipinos crowded before the improvised grandstands to watch and listen. And throughout the Islands every community of importance held its own independence celebration complete with parades, bands, salutes and the many speeches Filipinos enjoy.

Dignitaries who assembled in Manila for this occasion looked out over a city that had been more thoroughly wrecked than any other capital in the world except Warsaw. The once-proud public buildings patterned after the architecture of Washington, D.C., had been blasted by dynamite and pocked by shells when liberating U.S. forces dug out the Japanese defenders. The old walled city erected along the Pasig river by the Spanish was levelled except for the skeletons of its cathedrals and the massive stone walls. Once known as the "Pearl of the Orient" because of its tree-lined avenues, happy blending of native and introduced building forms and superior sanitary facilities, downtown Manila now was 80% destroyed.

Throughout the land most smaller cities had suffered similarly, particularly during the last desperate days when the Japanese often deliberately despoiled government offices, schools and

churches. Bridges, ferries and telecommunications had been choice targets for the contending armies. During the years of occupation, looters had dismantled much that was movable from factories and homes and sometimes burned the buildings. Carabaos that pulled farmers' plows had been commandeered by Japanese or guerrillas, or perhaps eaten in a time of want. Commerce was at a standstill, and cloth, salt, rice and other staples of life were in acutely short supply. With war had come disease; islands once virtually rid of malaria had been reinfected and large percentages of the inhabitants laid low at a time when imported curative drugs were unobtainable.

The new nation was critically handicapped at its inception by the division among its people over the issue of collaboration. Most of the older generation of leaders, including President Roxas, had been associated in some manner with the puppet government sponsored by the Japanese, and the covert assistance to the Allied cause pleaded by these men was not easily evaluated. Some families also had made fortunes dealing with the enemy or speculating in scarce commodities. Now public opinion led chiefly by former guerrillas demanded an accounting. The U.S. army had muddled the situation by its careless management of guerrilla recognition and awards of back pay for wartime service. So many persons who had lived carefully in Manila throughout the war or actually collaborated with the Japanese were recognized as guerrillas, with all that this implied in status and benefits, that a number of real fighters from the hills were disgusted and refused to seek recognition for their services. The United States government, which presumably had legal jurisdiction over such problems up until the time of independence, chose not to act and instead announced that this was a problem to be settled by Filipinos. President Osmeña had induced the Philippine Congress to authorize a people's court to try those accused of collaboration. But Solicitor General Lorenzo Tañada and his staff found their prosecution of such cases hampered by innumerable delays. A general amnesty for political and economic collaborators with Japan was announced by President Roxas on Jan. 28, 1948. Although this did not officially extend to those found guilty of

treason, acting as spies or otherwise militarily aiding the Japanese, it marked the end of substantial Philippine government concern with this issue. While time has tempered their feelings and led some Filipinos to be more charitable toward men who worked alongside the Japanese, bitterness over the question of collaboration continues to influence political alignments and events.

Inevitably, the early years of independence were a time of inflation. Filipinos with pockets full of wartime back pay who had craved a fountain pen, a favourite brand of American cigarettes, a can of milk or a shirt now paid fabulous prices for the few goods available. During the first five postwar years United States expenditures in the Philippines exceeded \$2,000,000,000, including approximately \$520,000,000 for war damage payments and reconstruction of public buildings and facilities, nearly \$200,000,000 to Filipino veterans for back pay, and roughly \$250,000,000 to civilian employees of the U.S. army. The inflationary pressure thus generated was relieved almost entirely through consumer spending. War matériel that had cost more than \$1,000,000,000 had been stockpiled in the Philippines for the invasion of Japan. This surplus now was transferred to the new government at a "book value" of \$50,000,000. Spotted through the islands were enormous dumps of vehicles, uniforms, construction equipment, steel mats for landing fields and all the paraphernalia an army needs to live, move and fight. G.I.'s, anxious to get home, had left them sometimes without adequate guards or accurate inventories. The opportunity to profit by theft or buying surplus for a fraction of its value with political protection led to the creation of a class of Americans and Filipinos who made easy money and were not always bound by moral scruples.

Before the war firearms were not commonly available in cities or rural communities, lawlessness was kept to a minimum, and citizens regularly left their homes unguarded with doors and windows open. Now all this had changed. For years it had been patriotic to steal from the Japanese, and many had lived by it. Such habits were not soon forgotten, particularly among those unwilling to adjust to the humdrum of a workaday life or unable to find useful employment. Weapons had been distributed almost indiscriminately to the resistance forces and more were readily available from the cases of "surplus." As postwar theft and banditry multiplied, Filipinos found it necessary to protect their windows with elaborate iron grillwork, raise walls around their homes and lock their gates. Large *hacenderos* built up their own police forces outfitted with automatic weapons to protect property and occasionally enforce the views of the owner. Business-

men and officials began carrying .45-calibre automatics and .38-calibre pistols, and banks, public offices and night clubs posted signs at doors announcing "Please check your firearms here," with a guard to collect and ticket the weapons.

Moral corrosion reached deep into the life of the Philippine republic during its first years. Senators and congressmen were prominent among those who flaunted their corruption, and one of them candidly justified his use of public office for private gain with the announcement, "This is why we are here." Congress awarded its members each a quota for Chinese who could enter the Islands, and some collected fat fees in return for admitting aliens. Amidst the disorganization of government that was a heritage of war when records had been destroyed, new opportunities were created for patronage; and the rigid requirements for civil service acceptance and advancement established during the period of U.S. administration were modified to accommodate those with powerful political friends. As the quality of the government services deteriorated, so did performance. Goods were boldly pilfered from the Manila docks where they were supposedly under the protection of the customs service. Taxes frequently were collected most fully from those who failed to bribe the collector. The essential honesty of the Philippine government personnel was being undermined both by the spectacle of prominent men who helped themselves and their relatives and by the high cost of living, which was more than five times that of prewar. It was a time when materialism gained a new supremacy in the minds of Filipinos, particularly in the larger urban centres.

The most severe symptom of the social ills afflicting the young republic during its early years was the Communist-led Hukbala-hap rebellion. The Huks, as they were popularly known, were officially organized in 1942 as the Anti-Japanese People's Libera-

tion Army, which rallied its strongest support among the tenant farmers of central Luzon. From bases in the almost impenetrable Candaba swamps and the watery marshes skirting Manila bay on the north, these guerrillas fought a running war against the enemy and claimed a commendable record for their resistance. Their politically conscious leadership, including prewar Socialists and Communists, went beyond the scope of most other guerrilla organizations in building local instruments of civil authority. And when an armed Huk chanced upon his prewar landlord, whom he often resented, the result was sometimes a brutal settlement of old scores. This brought the Huks into conflict with the U.S.A.F.F.E. (U.S. army forces, far east) guerrillas, who included some of the educated and patriotic sons of large landowners and Americans who had escaped from the Japanese.

Largely because of friction with the U.S.A.F.F.E. guerrillas and the wartime abuses charged to the Huks, the U.S. army denied them recognition and back pay for their resistance efforts. An important opportunity thus was lost to encourage many ordinary folk in the movement to return to peaceful pursuits. President Roxas and the Liberal party majority refused to seat the rebellious Huk commander Luis Taruc and his colleagues after they were elected to Congress. Some Filipinos felt that the move was aimed to ensure passage of the controversial "parity" amendment to the Philippine constitution granting Americans equal economic opportunities with Filipinos, for 28 years, as called for in legislation enacted by the U.S. congress. Actually, it was an expression of the increasingly fierce social-political struggle. These rebuffs, however, strengthened the influence of the extremist Communist elements in the Huk organization and facilitated their attempts to capitalize upon the postwar frustration of men who had fought but found themselves with little left except their arms.

The mass appeal of the Huk rebellion, however, had deeper roots; this revolt against authority drew its vital strength from the misery and dissatisfaction felt by rural folk in much of Luzon and on some other islands in the archipelago. There abuses were multiplying as a result of an almost feudal landowning system resting upon a near-primitive agriculture. As the population grew, more families competed for the right to work the same fields. The war left many a peasant farmer without even his meagre capital in tools and livestock. Unemployment, particularly among the educated youth, fostered a feeling of despair. A Rice Share Tenancy law had been passed by Congress awarding the tenant farmer 70% of the main crop when he supplied his own seed, tools and work animals, but it was rarely enforced. Instead, large landowners were inclined to collect half the crop, and, if their own private guards were inadequate, occasionally arranged with a local commander of the Philippine constabulary, or national police force, to assist in rent collection. Lacking means to feed and clothe his family, the peasant turned to the usurer, who might be a landowner or a local Chinese merchant, and became mired in debt.

Farmers in an ugly mood were receptive to the persuasions of young Huk organizers, who often were recruited from these same rural communities and indoctrinated by the Communists to promise land, justice and a voice in government. Once Huk power was established in or near a community, those who were reluctant to co-operate with it were compelled to do so and to furnish the rebel authorities with rice, labour and information. Occasionally the villagers were given a share in the funds and supplies the Huks captured in raids on government offices, through kidnapping wealthy Filipinos and holding them for ransom, and by outright banditry.

At its peak the Huk movement had perhaps 30,000 armed men in its regular guerrilla-style military establishment, and auxiliaries available for limited duty may have numbered sev-

eral times as many. Friendly supporters could never be accurately gauged, but they included a significant portion of the poor farmers in Luzon. Most disturbing was the Huk success in winning over Filipino youth, some of whom were sent to the mobile Stalin university established by the movement to school propagandists and indoctrinate Communist cadres. While maintaining their rear bases deep in the Sierra Madre and Zambales mountains, the Huk forces roamed over most of central and southern Luzon. During the first years of independence they developed a strong following in the infant labour movement, especially within the Congress of Labor Organizations. Sympathizers became active in schools. Their agents penetrated many bureaus of government and the military forces, and Huk intelligence at one time was superior to that of the Philippine army and constabulary. Senior Huk leaders adhered to the Communist line, preaching hatred of the United States. They seemed to borrow encouragement and some guides to their military and political strategy from the Chinese Communists, who were then on the threshold of power. Allied with the Huks was the small Communist organization that had grown up among Chinese in the Islands as part of their resistance to the Japanese.

The Republic Totters

The Philippine republic reached its lowest ebb with the presidential election of 1949. Elpidio Quirino, who had succeeded to the presidency upon the death of Manuel Roxas in the spring of 1948, was the candidate of the Liberal party. His running mate, Fernando López, was a prominent member of the politically and financially potent planter group, or "sugar bloc." The opposition Nacionalistas nominated José Laurel, the former supreme court justice who had served as president of the Japanese-sponsored puppet republic. But party affiliation did not determine loyalties in this struggle. Political leaders such as Sen. Tomás Cabili, the burly and independent-minded guerrilla chieftain from Mindanao, forsook the Nacionalistas in protest against their choice of a candidate who had worked with the enemy. As the campaign developed, resentments accumulated during and after the war were unleashed—some Filipinos felt it their patriotic duty to prevent Laurel's election. In one municipality in central Luzon three candidates for mayor were killed while campaigning. Even in areas remote from the scene of the Huk rebellion, violence became politically expedient. In several Visayan provinces landowners in control of local government used their private guards to intimidate the opposition. Election day was one of considerable bloodshed and much abuse of power by the police and military.

Ballot boxes were tampered with and voters denied freedom of choice to an extent that made the election of limited worth as an expression of popular choice. The Manila press also noted that there were a number of communities where "birds, bees, and even trees had voted." The incumbent Liberal party was proclaimed the winner. Followers of Laurel in his home province of Batangas staged a brief revolt that was called off only after delicate negotiation.

In the aftermath of the 1949 elections Filipinos discovered that officials seeking votes in contested communities had freely handed out treasury warrants to pay for schools and bridges. The national exchequer, already impoverished by ineffective tax collection, was facing bankruptcy. Construction on roads and other public works had to be halted as funds to pay for them ran out. Elementary schoolteachers, who in the Philippines are paid by the national government, waited three and four months for their salaries. The government also had difficulty finding funds to pay the army fighting the Huks. In the winter of 1949-50 foreign exchange reserves sank so low that it was necessary to impose controls—dollar expenditures in the Islands by the United States were tapering off, and the prewar export industries depending principally upon sugar, Manila hemp and coconuts had not yet been fully re-established. The taste for consumer spending continued, however, and some of the most notorious scandals of the postwar era came out of the Import Control office established to determine who should be permitted to bring in the goods that earned quick fortunes. While President Quirino launched a "national mobilization program" and made some sound government investments, particularly in electric power development, the Philippine economy was not sufficiently recovered from the war to stand on its own. Under the combined impact of rebellion and social, economic and political malaise the administration in Manila was losing its capacity to govern, and, in turn, Filipinos were losing faith in their competence to manage representative institutions.

U.S. Interest Renewed

Communist conquest of the mainland of China in 1949 and the outbreak of the Korean war in June 1950 galvanized the U.S. government into a belated reassessment of Philippine affairs. The most urgent concern was strategic; with the Chinese mainland under unfriendly management the island nations of the western Pacific acquired a new significance for U.S. military planners. By an agreement signed in 1947 the United States had retained substantial naval, air and other military bases in the

Philippines that now became of critical importance for backstopping the defense of Korea, Japan and Formosa. The Huks already had forced the U.S. 13th air force, based at the largest of these, the 158,000-ac. Clark Air Force Base—Fort Stotsenburg reservation in central Luzon, to bring supplies from Manila in armed convoys. The demonstrated capacity of Mao Tse-tung and his comrades to come down out of the hills, take over a country and build a massive army in short order alerted Washington, D.C., to a sober estimate of the Huk menace. And at this critical juncture other Asians were discovering that the "show window for democracy" the United States took pride in having helped establish in the far east was not working to the satisfaction of its citizens. The United States was confronted now with the results of its failure to ensure that the Philippines acquire an economic and social base adequate to support the political institutions of the young republic.

An emergency loan was arranged in the summer of 1950 to provide pay for the Philippine army if the national treasury defaulted, and a Joint United States Military Assistance Advisory group was established in Manila. With its complement of a few dozen officers, including several with rare talent and insight, J.U.S.M.A.A.G. assisted in an organizational revamp of the armed forces of the Philippines. At new schools Filipinos were trained in maintenance and use of weapons and matériel that could be spared for the Islands after meeting urgent needs of the war in Korea. A group of able Filipino officers were assisted in making staff studies of their military establishment which provided the basis for a far-reaching change in command; selected senior officers were retired and replaced with aggressive younger men, many of whom were veterans of the resistance. One of the new battalion combat teams, numbering about 1,200 men, went as the Philippine contingent to fight alongside other United Nations forces in Korea. Most radical was the change that occurred in the relations of the armed forces with the citizenry. Formerly, soldiers had been more feared than the Huks in some communities. Now the army under the guidance of specially schooled officers began to evolve a "social conscience"; military courtesy was enforced and soldiers were instructed in winning the confidence of rural Filipinos by responding to their needs for protection, payment for rice and chickens commandeered and justice in dealings with landowners and officials. Huks were induced to surrender by offers of land and a new life on the frontier of Mindanao. The remaking of the Philippine defense establishment which led in time to the military defeat of the rebellion was a near-model in Philippine-American co-operation. Given the means and an opportunity the younger Filipino officers, many of whom had risen from humble origins, proved they possessed the capacity to manage their problems.

After Japan's surrender the United States government had lent substantial technical as well as financial assistance toward re-establishing administration in the Philippines. The bureau of public health, weather bureau, bureau of public highways and other specialized instruments of government had been aided by their United States counterparts through training of staff and loan of technicians and in reconstructing their facilities. In its search for a more comprehensive approach to this assistance, the

U.S. PILOTS RACING FOR THEIR PLANES during an alert test at Clark Air Force Base in 1954. The U.S. maintained a strong military establishment in the Philippines from 1950

VETERANS' FARM, an establishment of the Philippines Economic Development corps designed to provide housing for former servicemen and Huks who were either without homes to which to return after the war or who had always before lived in primitive villages and now sought a better way of life. Land was cleared at the edge of the jungle on Mindanao in 1951; several other communities were subsequently completed. Each immigrant family was given a home, farm land and a daily loan until the farms became productive. The settlements included schools, churches, hospitals and libraries

Truman administration now dispatched about two dozen experts, known as the Bell mission, to survey conditions in the Islands. They submitted a perceptive report calling for action on basic problems of land reform, unemployment and lack of opportunity for the young. Late in 1950 the Philippine and United States governments signed the Quirino-Foster agreement pledging support for a joint development program anticipating about \$250,000,000 in U.S. grants and loans over the next five years. The United States, however, imposed conditions for this aid: the Philippine government was pledged to enact tax measures and spur collection adequate to meet operating costs, and pass a minimum wage law to protect the lowest-paid workers who might otherwise bear most of the burden of such taxation. The Philippine congress by resolution was asked to indicate its support for the program. After several months of jockeying by reluctant senators and congressmen, these conditions were met, and in the spring of 1951 the U.S. Economic Cooperation administration to the Philippines began operations.

Filipino Citizens Mobilize

More consequential than these official moves was the awakening determination of ordinary Filipinos to recapture their political heritage. The republic has a free and vigorous press centred in Manila and a number of independent radio stations. While of interest primarily to the more educated urbanites, these two mediums do reach into most settled communities in the Islands and shape public opinion. In this time of national crisis Filipino newspaper and radio men generally proved their courage by

vigorous portrayal of the misdeeds of officialdom and the ills confronting the country. Exposés and headlines announcing "Anomalies Suspected" became commonplace. Few constructive alternatives were offered, but the nation was aroused. Disturbed by the drift within their government and the threat of chaos, Filipinos acted together in search of answers. Prominent among the groups whose meetings became forums for discussion were the civic organizations of Lions, Rotary, Junior Chambers of Commerce and the smaller League of Women Voters. Religious and youth groups such as the Young Men's Christian association and Catholic Action held seminars on national problems and the threat of Communism. Filipinos impatient for solutions joined organizations such as the new Citizens' party led by Senator Tañada, which enlisted some of the more idealistic and prominent younger men on the threshold of politics. Among the effective new tools now forged was the National Movement for Free Elections, which in co-operation with civic and regional organizations launched a campaign to preserve the franchise for Filipinos.

A Leader Emerges

The time was ripe for a leader who could satisfy the yearning of Filipinos for integrity and competence in tackling their problems. The lot fell to Ramón Magsaysay. Elevated through the

hard school of guerrilla warfare from a trucking company employee to military governor of his home province of Zambales, he was elected to Congress after the war. On the armed forces committee of the house of representatives Magsaysay had been at grips with the most acute of all Philippine needs—that of re-establishing law and order throughout the land. In Sept. 1950 he was named secretary of defense in the cabinet of President Quirino. This tall, well-muscled man of forthright manner and simple tastes soon captured the popular imagination. Magsaysay was then in his early 40s and possessed of extraordinary energy. In rebuilding the armed forces of the Philippines and carrying the war to the Huks in the hills he moved about the Islands by plane, jeep and on foot, making surprise visits to units in action, removing incompetent commanders and promoting the deserving on the spot. Because he felt himself a man of the people, and the young army staff officers had begun to reorient the troops to this attitude, Magsaysay was able to win the confidence of ordinary Filipinos. Aggrieved tenants welcomed his assignment of army lawyers to fight their cases in court. And from citizens who once again had come to trust the armed forces of their government, the defense department secured vital intelligence that permitted them to begin outwitting the Huks. A guerrilla sent by the Communists to liquidate Magsaysay was so won by his sincerity that the agent instead offered information which led to the arrest of most Philippine Politburo members who had been hiding in Manila. In the Nov. 1951 elections for eight members of the 24-man senate, governors and municipal officials, the army and constabulary that had learned new loyalty to the constitution under Magsaysay's direction were used to safeguard the polls. The result was an orderly and free election in all but a few provinces that gave the opposition Nacionalistas substantial representation in the government.

Almost inevitably Filipinos in search of a new promise in politics turned to Magsaysay. One evening in Nov. 1952 he was invited to a secret meeting at the home of Senator Tañada with Sen. Eulogio Rodriguez, veteran chairman of the Nacionalista party, and Sen. José Laurel and Sen. Claro Recto. An agreement signed then and carefully locked away pledged this triumvirate of Nacionalista leaders to support Magsaysay's nomination as presidential candidate of their party and concurrently of the smaller Citizens' party. In return he promised to "consult" them on important appointments. Philippine politics are highly personalized, and loyalty to a party or a platform seldom deters advantageous realignment. In this instance the Nacionalista chiefs picked as their candidate a political newcomer and a Liberal for one reason—to win. They reasoned that Magsaysay combined the attractions of a popular hero and support within the armed forces which would prevent possible use of these forces against them as had happened in 1949. Early in 1953 Magsaysay resigned as defense secretary and soon thereafter was nominated by a neatly managed Nacionalista convention. Within the Liberal party also there was dissatisfaction with Quirino's leadership. When the president insisted upon seeking re-election despite his ill health and the constitutional provision limiting him to another two years in office, a large faction, including the sugar bloc, walked out of the Liberal convention. After an abortive attempt to back Carlos P. Romulo for the presidency, this new Democratic party under the guidance of staunch independents such as Sen. Tomás Cabili threw its support behind Magsaysay in return for acceptance of its incumbent congressional and local candidates by the Nacionalistas.

Elections of 1953

The 1953 elections became the critical test of representative processes of government in the Philippines. Could the republic manage an orderly transfer of power from one party to another?

Except for the city of Manila, where the Nacionalistas in 1951 had elected as mayor the volcanic-tempered and courageous Arsenio Lacson, a one-time newspaper columnist, boxer and congressman, the Liberals enjoyed the immense advantages of controlling administration throughout the Islands. The Philippine president has inherited many of the powers exercised by the Spanish and United States governors general. He is authorized to suspend elected provincial governors and mayors as well as appointive officials. Tax collection is equally centralized, and local communities are largely dependent upon the national government for funds to build water systems or roads. The nearly 90,000 public schoolteachers and educational administrators paid by the national government composed the single largest and most extensive official entity in the Philippines. Schoolteachers had been chosen as chairmen and poll clerks of the electoral boards in each precinct. Determined to win their co-operation, the Liberals had given the teachers a pay increase a few months before the election. School superintendents were shifted from one province to another in an effort to place staunch Liberals in key areas. Among the incumbent Liberal officials were a number who feared that a change in administration might result in their trial and imprisonment for flagrant abuse of public funds and authority. They sought to prevent a change in political control by any means at their disposal.

An Old Order Upset

William Howard Taft, after serving as the first U.S. governor of the Philippines, reported:

... Much remains to be done ... in teaching the people of the Philippine Islands not only that they have rights under the law, but also that they cannot hope to enjoy such rights unless they acquire courage and independence sufficient to assert them against attempts by their fellow Filipinos to perpetuate the system of "caciqueism" or bossism, by which they have heretofore been completely governed. ... Comparatively few of the Filipinos who have been in politics ... have felt an interest in teaching the common people their individual rights in respect to personal liberty and property ... this work of instruction will require many years before the country is rid of the feudal relation of dependence which so many feel toward their wealthy or educated leaders. ...

The *caciques* derived power originally from ownership of land, which gave them control of the lives of the people who worked for them under the Spanish system of rule. With the pattern of their patriarchal authority well established, they were able to hold

RAMÓN MAGSAYSAY campaigning for election in 1953. Magsaysay's speaking tour of rural areas and remote villages was an important factor in his landslide victory over Elpidio Quirino for the presidency

control under a new guise from the first elections. A perceptive Filipino politician put it this way: "Under the Spanish, the country was run by the friars and the *hacenderos*. Under the Americans, when all kinds of people went to school and leaders had to be elected, 'talkers' were able to win. So the *caciques* bought them." This was the political structure on which rested the power of the provincial bosses who had dominated both the major parties and traditionally bought or traded votes in return for favours or cash.

Magsaysay and his followers now undertook to break this pernicious political system, which in 1953 worked primarily to the advantage of the Liberals, by organizing the first mass political campaign in Philippine history. Even before Magsaysay was nominated a corps of idealistic younger Filipinos had established the Magsaysay for President Movement, which held Island-wide rallies that primed the delegates before they departed for Manila. Organizational talents and skills acquired in guerrilla days now were applied to politics. A special M.P.M. unit infiltrated the Liberal party and key government bureaus, assembling intelligence which was used by other Magsaysay workers to confuse the opposition. While the coalition of Nacionalista, Citizens' and Democratic parties attended to routine politicking, the M.P.M. built an organization which enrolled roughly 1,000,000 members. Filipinas who traditionally had shunned open participation in politics were organized into the Women's Magsaysay for President Movement. They did special jobs such as house-to-house canvassing to remove phony names from the registration lists through court petitions, and were largely immune to the threats that kept men at home. Magsaysay set the style for the campaign by going into the remotest barrios and talking to the ordinary folk about their needs for wells, schools and roads and most of all for a government that would be responsive to their desire for social justice and peace. The ferment aroused by this new kind of campaigning drove other candidates into the villages. One congressman seeking re-election in central Luzon formerly had been content to hold meetings in towns and

give pig roasts for his followers. This time he and his wife walked in their bare feet through rice paddies to visit more than half the villages in their district.

Election day in Nov. 1953 climaxed a national effort that stirred Filipinos as nothing else had in the postwar era and did great credit to their mastery of the democratic method. Due in large measure to the mobilization of civic groups to watch the polls, more than 5,000,000 Filipinos voted in a fair and peaceful election. Magsaysay and most of the candidates on his ticket won overwhelmingly—they received roughly two votes for every one cast for the Liberals. Individual Filipinos who took immense pride in this national performance usually were unaware of the major social upheaval of which it was an integral part. For the first time the landed gentry and provincial bosses in large areas had not delivered the vote; ordinary Filipinos had cast their ballots for a man who voiced their aspirations.

The "Time of Magsaysay"

In the language of the farmer the administration that began with the inauguration of "their" president before more than 250,000 cheering citizens on Manila's Luneta on Dec. 30, 1953, has become known as the "time of Magsaysay." It has been a period of soaring expectations that repeatedly foundered upon the hard realities of entrenched political opposition to drastic reform, chiefly in Congress, and the lack of a body of tested guides by which the Philippine republic could better life for its citizens. But the last 2½ years of the first decade of independence also witnessed substantial achievements when government became more responsive to the needs of Filipinos and acquired better competence to meet them. It was a time when more creative values won acceptance. A thoughtful Filipino explained: "Before the war our big landowners used to brag about how roughly they treated their tenants. Now they talk about how well off their people are."

Symbolic of the spirit that Magsaysay brought to Malacañang, the "palace" of the chief executive on the bank of the Pasig river, is the Presidential Complaints and Action committee he

RECEPTION HALL of Malacañang palace, Manila, the "White House" of the Philippines

established for any and everyone seeking redress through government. On his first day in office the new president announced that the bureau of posts and telegraph would accept all telegrams addressed to him for a charge of ten centavos each. Citizens also were invited to write him, or they could bring their complaints in person. The P.C.A.C. was established in a wing of Malacañang to receive these complaints and the stream of callers who came singly or in delegations, all intent upon telling their story to the president. A team of youthful investigators, again headed by former guerrillas, sorted the complaints and on behalf of Magsaysay sought explanations from appropriate government officials. When personal action by the president was needed to help someone in trouble, Magsaysay usually responded with characteristic vigour. Almost overnight officials long callous toward the needs of simple people acquired a new respect for public opinion; complaints which totalled more than 50,000 annually became an effective means for citizens to help root corruption out of government.

Organized labour has "come of age" under the Magsaysay administration and is today among the more powerful of the new forces moulding institutions within the republic. In a belated attempt to win labour votes the Quirino administration in 1953 abandoned compulsory arbitration and enacted the "Magna Carta of labour" patterned substantially after the Wagner act in the United States. Upon assuming office Magsaysay named as secretary of labour Col. Eleuterio Adevos, wartime organizer of the Hunter's R.O.T.C. guerrillas, who at the age of 32 had been the shrewd, energetic chairman of the Magsaysay for President Movement. During his term in office labour unions have doubled in number from 836 to more than 1,700, including some company unions, and union membership has grown from 300,000 to more than 700,000. Leadership is still inexperienced in some unions, and others suffer from bossism. But in the words of the labour secretary, "Collective bargaining is now the basis of labor-management relations, though big business favors compulsory arbitration and the courts still are somewhat management inclined." Filipino workers in the larger enterprises and national government employees are receiving the minimum industrial wage of 4 pesos (\$2) daily or more. With rare exceptions agricultural labourers still are denied their legal daily minimum pay of 2½ pesos. Recently the department of labour has begun helping some of the most miserable workers in the Philippines, the *sacadas*, or migratory field hands who labour on the sugarcane plantations of Negros for as little as 90 centavos a day and are victimized by "contractors." Despite congressional attempts to cripple such efforts by cutting the labour department budget, concern for the welfare of workers is recognized as a field for public action. Significantly, it is premised on the philosophy that by expanding the consuming power of workers a healthy base for the economy will be created.

Magsaysay has chosen as a major breakthrough point for his administration the Agricultural Credit and Cooperative Financing administration, begun with United States assistance under the previous administration. A tough-minded 40-year-old army colonel, Osmundo Mondofedo, is in charge of an organization that has helped start nearly 300 co-operatives with about 150,000 members. It is systematically cutting in on the marketing monopolies with which Chinese and other middlemen formerly enriched themselves at the expense of farmers. Credit which once was available to villagers at best on usurious terms, with interest rates of up to 100% annually, now is buying carabaos, tools and seeds needed for expanding productivity.

An Agricultural Tenancy commission and a Court of Agrarian Relations are new instruments created in the mid-1950s to attack age-old abuses. A National Resettlement and Rehabilitation administration has moved more than 10,000 families onto public

HIGHWAY OUTSIDE MANILA. Roadbuilding was an important part of the domestic program of the Magsaysay government

land and is buying a few large haciendas for resale to tenants. Concern for the little Filipino is evident in the department of agriculture. Sales of large tracts of public land to single purchasers are being curtailed, and instead most of the public domain is reserved for small homesteaders. An acutely felt need on the part of many small farmers in recently settled areas has been for titles to their land that would afford security and collateral for bank loans. With United States aid the bureau of lands has been modernized and titles are being issued at several times the earlier rate.

Drinking water is highly valued in barrios where villagers sometimes during the dry season must carry it three miles or more in five-gallon kerosene tins. In the first flush of postinauguration enthusiasm Magsaysay promised 10,000 wells in one year—it was estimated that 56,000 wells were needed then and another 2,400 required annually to keep pace with population increase. So far more than 2,000 deep and shallow community wells have been dug. Over 4,000 schoolhouses have been built, with

army engineers supervising prefabrication and transportation of these buildings. Through the International Cooperation administration the United States has helped construct a system of main highways opening virgin lands on Mindanao and other thinly peopled islands. Roads linking the barrios with major transportation routes are wanted by farmers anxious to market their crops.

Under a recently evolved "partnership" principle the national government matches village contributions in labour or kind toward such construction.

The pernicious system of barrio, municipal and provincial dependence upon the national government continues and will remain an obstacle to progress at least until tax collection is decentralized. But the paternal attitude toward local government it encourages is being partly overcome by a new law that weakens the power of the *cacique*. Sponsored by Senator Cabili, a close supporter of Magsaysay, this Barrio Self-Government act permits the villagers to elect their own councils. The barrio lieutenant who formerly depended upon the municipal mayor for his position now must answer to his neighbours, and there is evidence of greater self-confidence and initiative in many villages.

Old Problems Remain

Despite these encouraging efforts of the Magsaysay administration, the chronic ills inherited from the past remain the greatest threat to the well-being of the republic on its tenth anniversary. Unemployment is the most acute symptom. Almost 2,000,000 Filipinos—more than one out of every five in the labour force—are jobless. Included in this number are approximately 200,000 college graduates. While a family system that

provides for the less fortunate minimizes suffering, this severe restriction of opportunity has a corrosive effect. Cattle rustling and banditry, still common in some provinces, disillusionment among educated young Filipinos, and overstuffed government bureaus all relate to the stagnant nature of the economy in a land where perhaps 90% of the wealth is owned by less than 10% of the citizens. The ravages left by the war have largely been covered by new construction, and sugar centrals and coconut oil mills have been restored to better than prewar productivity. A mining boom in base metals and growing exploitation of the forests for export of Philippine mahogany promise to help ease the nation's dollar shortage within a few years. In the meantime a small consumer goods manufacturing industry is emerging, providing such things as school crayons and pencils, undershirts, paints and pianos that formerly were imported. But this limited development has not nearly kept pace with population growth.

In the first decade of independence the majority has shown little respect for minorities, particularly the "alien" Chinese who number about 350,000 and have controlled about three-fourths of the retail trade and an equal percentage of the rice mills and provided other service functions. A Retail Trade Nationalization law enacted early in 1954 is the severest measure yet in a politically popular trend toward limiting economic and professional opportunities to Filipinos. Denied the right to purchase real estate and threatened with loss of their retail enterprises, the Chinese have restricted credit and shied away from much of the industrial development in which their capital and skills could have played a vital part.

An issue that increasingly plagues the republic concerns the role of religion in education and politics. Throughout the period of United States administration the dominant Roman Catholic Church had pressed for an opportunity to teach its faith in the public schools. A compromise dating from the administration of Gov. William Howard Taft permitted instruction in religion in the school buildings outside class hours for a limited number of sessions each week. The constitution in 1935 provided for a continuation of this practice. After Magsaysay's election, secretaries of education friendly to the Catholic Church viewpoint were appointed. A year later earlier precedents were reinterpreted to permit optional religious instruction during class hours. This aroused the opposition of Protestant churches and large native religious groups, including the Philippine Independent Church and the Iglesia Ni Cristo, which claimed that their rights were being threatened. During the elections for nine senators and provincial and local officials in 1955, two candidates for the senate appealed to the electorate on the grounds that they would urge the Catholic position, and won.

At a time when the republic is in critical need of rational leadership the public schools are deteriorating at a pace that disturbs all conscientious educators. Most notable is the lowering in standards of English instruction; reputable colleges find that up to half their freshmen applicants do not command sufficient English to master their textbooks and must often be given a year of preparation in English before they can become full-fledged students. Less scrupulous are some of the commercialized colleges that earn handsome dividends for their stockholders while offering inferior instruction to Filipino youth who are avidly in search of learning. A promising beginning in meeting the educational crisis has been made in the public schools with vernacular instruction during the first two years. The University of the Philippines and several of the better large private institutions which have been rebuilt and expanded offer education with credits recognized in the United States and Europe. But the Philippines lacks the centres for research, particularly in the humanities, from which could come the ideas the republic requires to chart its own sound course.

Young Republic in the Pacific

Because of their long and intimate ties with the West, Filipinos today know more about the United States and Spain than they do about their nearest neighbours—Indonesia, Vietnam and China. While they treasure the benefits they feel this association has brought them, there is a widely held view that the Philippines should take its place as one of the coming new nations of Asia. Since independence the republic has increasingly made itself heard in international councils at the United Nations and within its specialized agencies, at Bandung and at regional meetings such as a southeast Asian conference on coconuts held during 1956 in Manila. There its voice has been one of moderation, often explaining East and West to each other and siding staunchly with the democracies against the Communist world. But Philippine capacity to perform in this delicate role is severely restricted by the same handicap that hobbles the republic in formulating a fully independent foreign policy—the lack of Filipinos trained in the languages and cultures of other Asian countries. The infant foreign service has suffered from political patronage, particularly during recent years. Sensitive neighbouring nations that might learn much from the Philippines tend to hold themselves apart, feeling that the cultivation of interests should be mutual.

Japan by contrast seems bent upon making the Philippines its largest supplier of raw materials as well as a major customer

U.S. VICE-PRESIDENT NIXON and Mrs. Nixon touring Corregidor in a Jeep with Pres. and Mrs. Ramón Magsaysay in 1956. Nixon represented the U.S. at the ceremonies marking the tenth anniversary of Philippine independence

in southeast Asia. Trade between the two countries that languished for ten years after the war moved into a much more vigorous tempo with the 1956 agreement on reparations. Under this arrangement Japan is to compensate for wartime destruction with more than \$500,000,000 worth of capital goods and services and some cash to be supplied over the next 20 years. Already Japan is the biggest buyer of Philippine timber products, taking logs which are converted into plywood for export to America and Europe. Iron and copper mines are being developed in the Islands with the help of Japanese capital and technicians. And indications are that joint Philippine-Japanese enterprises will burgeon when relations between the two countries are fully normalized. The resentment against the Japanese still felt by the mass of ordinary Filipinos is not shared by Manila's bustling business community which sees the promise of greatly expanded commerce.

Philippine ties with the United States are being steadily modified in response to domestic pressures in the Islands and the demands of Pacific security. The Laurel-Langley agreement signed in 1955 substantially released the Philippines from onerous terms of the economic commitments made between the two countries at the time of independence. The authorities in Manila now are free to set their own value on the peso. Customs duties can be collected on United States merchandise entering the Philippines at a more rapidly accelerating rate than on goods moving from the Islands to the United States. And the Philippines affords Americans equal economic opportunities with those available to Filipinos in the United States. The United States continues to spend heavily for veterans' benefits in the Islands and recruits some Filipinos into its armed forces as provided by agreement with the republic. On the tenth anniversary of Philippine independence the United States agreed to relinquish its claims to ownership of the vast complex of military bases in the Islands and thereby removed the chief irritant between the two countries. These bases serve both the defense of the Islands and as the principal United States strategic leverage point for influencing the course of events in southeast Asia, where the Philippines as a member of SEATO (the Southeast Asia Treaty organization) is committed to co-operative defense of the region.

Philippine Lesson

The "great experiment," as the past half-century of Philippine-United States relations sometimes is termed, has been condemned and applauded by both Asians and Westerners. It does not fit into neat categories with their stereotypes about imperialism and oppressed colonials. Likewise, Filipinos today are not caught up in a national preoccupation with rejection of everything the white man has brought except his gadgets. While the Filipino has retained his love of fiestas, cockfights and long siestas, he has added

INDEPENDENCE DAY, July 4, 1956. The flag of the Philippines is raised on the staff where ten years earlier the U.S. flag was lowered for the last time

a growing mastery of the democratic approach. Initially, this was restricted to a rather narrow form of representative government. But in the first decade of independence amidst all the handicaps that a war-ruined country held for its citizens this ideal has been given a far wider and deeper application. Herein lies the great triumph of the Filipinos; that in spite of all the hazards and temptations of an uncertain era they chose democratic solutions with

all their imperfections. And there have been men and women sufficiently dedicated to give content to this choice. At a time when the rigorous demands for survival soon force abandonment of that which does not work, Filipinos are setting Asia an example which may not qualify as an elaborate "show window" but which does hold promise for the republic. "

U.S. state dept. disclosed that U.S. shipments of military supplies to Israel and Egypt had been stopped.

3 Israeli units were reported to have reached the east bank of the Suez canal.

Anthony Nutting, British minister for foreign affairs, resigned in protest against the government's policy of armed intervention in Egypt.

Iraqi and Jordanian governments confirmed that Iraqi and Syrian troops had entered Jordan.

NOVEMBER—Continued

Britain and France rejected the request of the UN general assembly for a cease-fire in the Suez canal area.

U.S. Secy. of State Dulles underwent an emergency operation in Washington, D.C., for removal of a section of the colon.

4 UN Secy. Gen. Hammarskjöld recommended the immediate establishment of a UN emergency force to supervise the cessation of hostilities in the middle east.

Moscow radio announced the formation of a new Hungarian government headed by Janos Kadar.

Pres. Eisenhower sent an urgent personal message to Soviet Premier Bulganin requesting that Soviet troops be recalled from Hungary.

UN general assembly voted (50 to 8) to send observers to Hungary to investigate the situation there.

5 British and French paratroopers were reported to have seized Port Said at the northern entrance to the Suez canal.

Soviet government announced that it was prepared to use force to crush aggression and restore peace in the middle east; White House warned that the U.S. would oppose any attempt at Soviet intervention.

6 Pres. Eisenhower and Vice-Pres. Nixon won 41 states and 457 electoral votes to win reelection to a 2nd term; Democrats retained control of both houses of congress.

U.S. state dept. issued a statement asserting that any violation of territorial integrity or internal sovereignty of Austria would be a grave threat to peace.

7 Britain and France ceased fire in Egypt at 2 A.M. (Egyptian time) and halted their advance against Egyptian forces in the Suez canal zone.

Nobel peace prize committee announced that it had found no worthy recipient for the 1955 and 1956 prizes.

Soviet troops were reported to have broken Hungarian resistance in Budapest and all other rebel centres except Győr in the northwest.

UN general assembly adopted (65 to 1) a resolution requesting Britain, France and Israel to withdraw their troops from Egypt.

8 Two U.S. Navy balloonists soared to a record altitude of 76,000 ft.

Israel agreed to withdraw its troops from Egypt as soon as satisfactory arrangements were made for a UN police force.

Pres. Eisenhower ordered administrators of the Refugee Relief act to take extraordinary measures to secure the entry of 5,000 Hungarian refugees into the U.S.

9 UN general assembly adopted a resolution calling on the U.S.S.R. and Hungary to cease interfering with the movement of Red Cross supplies into Hungary.

Pres. Eisenhower and his chief advisers briefed 23 congressional leaders on the middle east and east European situations.

10 First contingent of the UN police force to Egypt arrived by air at Naples, It., from Denmark.

White House confirmed selection of the undersecy. of labour, Arthur L. Larson, as director of the U.S. Information agency.

Soviet government said it would permit volunteers to proceed to Egypt if British, French and Israeli forces were not withdrawn.

Pres. Eisenhower rejected a Swiss proposal for a meeting in Switzerland of the heads of government of the great powers.

11 U.S. air force's first supersonic bomber, the B-58, made its maiden flight at Ft. Worth, Tex.

12 Prince Wan Waithayakon of Thailand was elected president of the regular 1956 session of the UN general assembly, opened at UN headquarters in New York city.

UNSecy. Gen. Hammarskjöld announced that Egypt had agreed to the entry into Egypt of a UN police force.

Gen. Alfred M. Gruenther, retiring supreme allied commander in Europe, was elected president of the American Red Cross, effective Jan. 1, 1957.

U.S. commerce dept. announced that the U.S. gross national product had reached the record annual rate of \$414,000,000,000 in the 3rd quarter of 1956.

13 British Colonial Secy. Lennox-Boyd announced the termination of British military operations against the Mau Mau in Kenya.

Polish government relieved former Soviet Marshal K. K. Rokossovsky of his posts as vice-premier and defense minister.

Gen. Alfred M. Gruenther, supreme allied commander in Europe, warned that the U.S.S.R. and the Soviet bloc would be destroyed if they attacked the west.

Raymond J. Saulnier of New York city was named to succeed Arthur F. Burns as chairman of Pres. Eisenhower's council of economic advisers; Paul W. McCracken of Michigan was named to the council.

14 Pres. Eisenhower stated that the U.S. would oppose through the UN any Soviet military intervention in the middle east.

15 Danish and Norwegian units, first contingents of the UN police force, arrived by air near Ismailia on the Suez canal.

Budapest central council of workers voted to continue its general strike until former Premier Nagy was restored and Soviet troops withdrawn from Hungary.

Arab league's nine members voted unanimously in Beirut, Leb., to break off diplomatic relations with Britain and France unless their forces were withdrawn from Egypt.

16 UN general assembly voted (47 to 24) to bar until 1957 debate on admission of Communist China to the UN.

17 Soviet radio broadcast a revised Soviet plan for world disarmament.

Oregon State defeated Idaho, 14-10, to win the Pacific Coast football conference title; Oklahoma defeated Missouri, 67-14, to win the Big Seven title.

Envoys of Israel and 12 NATO members walked out of a Soviet reception at the Kremlin in Moscow following a tirade by Soviet

Communist Party 1st Secy. Khrushchev.

Pres. Eisenhower approved new regulations permitting the U.S. Atomic Energy commission to make uranium available to nations desiring it for nuclear reactors dedicated to peaceful uses.

Soviet news agency announced that another Soviet nuclear test had been carried out at a great height over Soviet territory.

18 Sami es-Solh was named to succeed Abdullah el-Yafi as premier of Lebanon.

Poland was reported to have gained important economic, military and political concessions from the U.S.S.R. in an agreement signed in Moscow.

19 Hungary and U.S.S.R. asserted in the UN general assembly that there had been no mass deportations from Hungary.

Soviet government announced the appointment of former Polish Defense Minister Rokossovsky as a U.S.S.R. deputy minister of defense.

20 Gen. Lauris Norstad (U.S.) assumed command of the allied forces in Europe from Gen. Alfred M. Gruenther.

UNSecy. Gen. Hammarskjöld in notes to Britain, France and Israel asked them to explain the continued presence of their troops on Egyptian territory.

21 British Prime Minister Eden, it was announced, would fly to Jamaica for a 3-week rest.

V. M. Molotov was named Soviet state control minister, to succeed V. G. Zhavoronkov.

UN general assembly adopted (55 to 10) a resolution demanding that the U.S.S.R. and Hungary stop mass deportations of Hungarian citizens.

22 Maj. Gen. E. L. M. Burns (Canada) arrived in Cairo to assume field command of the UN police force.

NOVEMBER—Continued

Pres. Eisenhower acted under the Taft-Hartley law to appoint a 3-man board of inquiry to investigate the longshoremen's strike in east and gulf coast ports.

1956 summer Olympic games were formally opened by the duke of Edinburgh at Melbourne, Austr.

23 Yugoslav Communist press reported that Soviet security police had kidnapped former Hungarian Premier Nagy.

24 Longshoremen's strike in east and gulf coast ports was enjoined under the national emergency provisions of the Taft-Hartley law.

Pres. Eisenhower named James D. Zellerbach to succeed Clare Boothe Luce as U.S. ambassador to Italy.

Yale defeated Harvard, 42-14, to win the Ivy league football championship; Michigan defeated Ohio State, 19-0, to give Iowa the Big Ten championship.

25 Britain and France announced that they would accept unlimited numbers of refugees from Hungary.

26 U.S. Defense Secy. Wilson ended a long-standing dispute by ruling that the air force should control all missiles with over 200-mi. range.

27 Pres. Eisenhower issued a statement reaffirming U.S. friendship for Britain and France.

Jordanian government announced its determination to end its treaty of alliance and friendship with Britain.

Union of South Africa announced that it would withdraw from the UN in all but token activities in protest against debate on its racial problems.

28 Chou En-lai, Chinese Communist premier, arrived in New Delhi, India, for political talks.

White House announced the appointments of Lawrence G. Derthick as U.S. commissioner of education and Ellsworth Bunker as ambassador to India.

U.S. government was revealed to have expressed to Syria concern over substantial shipments of Soviet arms to Syria.

29 Pres. Eisenhower appointed Tracy S. Voorhees as his personal representative to co-ordinate Hungarian refugee problems.

U.S. government announced that it would view with utmost gravity any hostile move against Iran, Iraq, Pakistan or Turkey.

French government completed ratification of a treaty providing for evacuation of French forces from Libya.

Texas A. and M. defeated Texas, 34-21, to win the Southwest conference football title.

30 Floyd Patterson defeated Archie Moore in a bout at Chicago, Ill., to win the world heavyweight boxing title vacated by Rocky Marciano.

U.S. government put into operation an emergency plan for shipment of oil to Europe.

U.S. Secy. of Agriculture Benson removed peanuts and extra-long staple cotton from the soil bank program.

DECEMBER

King Faisal II of Iraq issued a decree suspending parliament for 1 month and placing Iraq under martial law.

Pres. Eisenhower increased to 21,500 the number of Hungarian refugees to be given asylum in the U.S.

Tennessee defeated Vanderbilt, 27-7, to win the Southeastern football conference title.

2 Cuban planes and ground troops were reported to have wiped out a force of 42 exiled revolutionaries who landed on the coast of Oriente province.

3 Federal Reserve board and Federal Deposit Insurance Corp. announced that U.S. commercial banks would be allowed to pay a maximum 3% interest rate on savings deposits effective Jan. 1, 1957.

Rumania and U.S.S.R. signed

a new agreement to continue their economic co-operation and permit Soviet troops to remain in Rumania.

Hungarian government reiterated its refusal to permit UN observers to enter Hungary.

British and French governments pledged complete withdrawal of their troops from Egypt without delay.

U.S. state dept. suspended cultural exchanges with the U.S.S.R. in protest against Soviet actions in Hungary.

4 Douglas MacArthur II, counselor of the state dept., was named U.S. ambassador to Japan.

U.S. army announced plans to deactivate its messenger pigeon training centre.

Oklahoma was selected as the best team in U.S. college football in 1956 by the Associated Press poll of sportswriters and broadcasters and the United Press board of coaches.

British government presented to the U.S. treasury dept. a request that 1956 interest payments on U.S. loans to the U.K. be waived.

5 Hungarian government rejected UN Secy. Gen. Hammarstrand's plan to visit Budapest.

6 U.S. government protested to the U.S.S.R. concerning the use of Soviet tanks against civilians in Hungary.

U.S. state dept. announced that Iceland had withdrawn its request that U.S. forces leave Iceland.

Pres. Eisenhower ordered an air- and sealift to bring 21,500 Hungarian refugees to the U.S. by Jan. 1, 1957, or shortly after.

7 Philippines was elected a nonpermanent member of the UN Security council by the UN general assembly (51 to 20) over Czechoslovakia.

Board of trustees of Princeton university elected Robert F. Goheen, a member of the faculty, to succeed Harold W. Dodds as president in June 1957.

8 Gov. Christian A. Herter of Massachusetts was named to succeed Herbert Hoover, Jr., as undersecy. of state.

1956 summer Olympic games ended in Melbourne, Austr.; in unofficial press scoring Soviet athletes scored 722 pt., U.S. athletes 593 pt.

10 Pres. Eisenhower catalogued a list of human rights which he said had been denied to the people of Hungary by Soviet terror and brutality.

Motion-picture industry revised and relaxed its code of morals and taboos for the first time since its adoption in 1930.

UN general assembly approved the nomination of Auguste R. Lindt (Switz.) as UN high commissioner for refugees.

International Monetary fund announced approval of a request by Britain to purchase with sterling from the fund up to the full amount of its \$1,300,000,000 quota.

11 U.S. interior dept. released a plan of action for assisting Britain and other European nations with increased oil shipments.

12 Paul E. Magloire, Haitian chief of state, resigned in the face of a nationwide general strike.

UN general assembly (55 to 8) censured Soviet intervention in Hungary and called for withdrawal of Soviet forces under UN supervision.

U.S. Atomic Energy commission announced that it was opening to the public a large volume of secret atomic information.

UN Security council voted unanimously to recommend Japan for membership in the UN but again rejected the application of Outer Mongolia.

13 U.S. defense dept. announced the formation of an expanded military air transport service under air force management.

UN general assembly approved the termination of trusteeship for British Togoland and its merger into the Gold Coast.

Hans Streuli was elected president of the Swiss confederation for 1957 at a meeting of the joint federal assembly.

14 Brazil was revealed to have purchased a 19,000-ton aircraft carrier from the U.K.

North Atlantic council concluded a 4-day meeting in Paris

with a statement declaring its members in general agreement on issues confronting NATO.

John Diefenbaker of Saskatchewan was elected leader of the Canadian Progressive Conservative party at a conference in Ottawa.

15 Pres. Eisenhower made available \$4,000,000 to the UN fund for aid to Hungarian refugees in Austria.

Soviet troops were reported to have been driven out of Miskolc, near the Czechoslovak border, in a pitched battle with Hungarian rebels.

British army commander in northern Ireland ordered his troops to take action against Irish Republican attacks believed to originate in the republic of Ireland.

16 British forces turned over control of most of Port Said to UN forces and retired to a narrow waterfront perimeter.

Indian Prime Minister Nehru arrived in Washington, D.C., for talks with Pres. Eisenhower.

17 Gasoline rationing was resumed in Britain for the first time since May 1950.

Brazil agreed to permit the U.S. to install a guided-missile tracking station on Fernando de Noronha island in the South Atlantic.

A Soviet-Polish accord signed in Warsaw defined conditions for the temporary stationing of Soviet troops in Poland under the Warsaw pact.

18 UN general assembly elected (77 to 0) Japan as the 80th member of the UN.

Bowden Wyatt of the University of Tennessee was named football coach of the year in a poll of the American Football Coaches Assn.

19 British government issued a white paper proposing limited self-government for Cyprus under a strong governor.

UN general assembly elected Colombia, Iraq and Sweden to nonpermanent seats on the UN Security council.

U.S. Vice-Pres. Nixon arrived in Austria by air to survey the Hungarian refugee situation.

C. D. Howe, Canadian defense production minister, announced that Canada would sell 225 jet fighters to west Germany.

20 Japanese diet (291 to 150) elected Tanzan Ishibashi to succeed Ichiro Hatoyama as premier.

Hungarian government reinstituted a decree permitting the jailing without trial of those who disturbed the public order or production.

Chou En-lai, Chinese Communist premier, arrived in Karachi on a 10-day official visit to Pakistan.

21 U.S. Export-Import bank offered Britain a credit of up to \$500,000,000 for purchases in the U.S.

22 British and French troops completed their evacuation of Egypt and UN forces took over the policing of occupied areas.

Col. Maludin Simbolon, 37-yr.-old Indonesian army commander, proclaimed himself military and political leader of central Sumatra in the wake of a bloodless army coup.

Mickey Mantle of the New York Yankees baseball team was named the male athlete of the year in a poll of sportswriters and sportscasters.

23 Soviet Communist party denounced elements inside the communist world who placed nationalism above unity with the U.S.S.R. and other communist nations.

24 Egypt submitted a resolution to the UN general assembly demanding reparations from Britain, France and Israel for their military attacks.

Central committee of the Soviet Communist party issued a call for strenuous efforts to improve economic conditions within the U.S.S.R.

25 U.S. Vice-Pres. Nixon in a nationwide radio-TV address urged all Americans to contribute freely to Hungarian relief agencies.

Mikhail G. Pervukhin was named to replace Maxim Z. Saburov as chairman of the Soviet state commission for current planning.

Indonesian Pres. Sukarno declared a state of emergency and siege in north and central Sumatra.

26 A large number of Negroes in Birmingham, Ala., defied the city law requiring racial segregation on buses.

Egyptian Suez canal authority reported that clearance of the canal had started in 2 places.

Associated Press reported a record 883 persons killed accidentally in the U.S. over the Christmas weekend.

Arthur S. Flemming, U.S. defense mobilizer, announced that he had refused to approve about \$2,300,000,000 worth of pending applications by the steel industry for accelerated tax amortization certificates.

27 Pres. Eisenhower announced the selection of John Hay Whitney of New York to succeed Winthrop W. Aldrich as U.S. ambassador to Britain.

28 Chinese Communist party in a radio broadcast reaffirmed its approval of Soviet military activities in Hungary and denounced Titoism.

Pres. Eisenhower authorized a

2nd U.S. round-the-world air line by permitting Trans World Airlines to link its international operations with Northwest Airlines.

29 Hungarian government announced mass dismissals of industrial workers and government employees effective Jan. 1, 1957.

Pres. Eisenhower designated fire-damaged regions around Malibu, Calif., as a major disaster area.

Federal Bureau of Investigation reported that more major crimes were committed in the U.S. in 1956 than in any previous year.

Official announcement stated that former Burmese Premier Nu would rejoin the government and resume the premiership.

30 Egyptian government consented to the immediate start of full-scale clearance of the Suez canal.

New York Giants defeated the Chicago Bears, 47 to 7, to win the National Professional Football league championship.

Budapest radio announced a Soviet loan to Hungary of the equivalent of \$50,000,000 for purchases in the west.

31 Brazil and U.S. signed an agreement providing for sale to Brazil of \$138,700,000 worth of U.S. surplus farm products.

U.S. Interstate Commerce commission authorized a 5% passenger fare increase on all western railroads and 8 eastern railroads and a 7% increase in Pullman fares.

Sabri el-Assali, Syrian premier, announced formation of a new cabinet including several leftists.

U.S. Secy. of State Dulles stated that in 1957 the U.S. would have to accept an increasing responsibility to assist free nations in the middle east and elsewhere to maintain their freedom and develop their welfare.

Accident Insurance: *see* INSURANCE.

Accidents. The death toll from accidents in the United States in 1955 was 93,489, an increase of 4% over 1954. There were 9,350,000 nonfatal injuries, about 340,000 of which resulted in some degree of permanent disability. Information available through Aug. 1956 indicated that the 1956 accidental death toll would be higher than in 1955, probably by about 3%.

The annual accidental death toll in recent years has been exceeded only by deaths from heart disease, cancer and cerebral haemorrhage. However, a study by the American Medical association revealed that accidents rob the nation of more working years than any disease. The reason is that most accident victims are struck down before or during their productive life, while disease deaths occur when the working years are largely past.

The 44th National Safety congress, held in Chicago, Ill., in Oct. 1956, marked 44 years of the organized national safety movement, of which the hub has been the National Safety council and affiliated local safety organizations.

Safety work is carried on continuously by progressive industries and by a large number of organizations, both governmental and private, operating in their particular fields of activity, such as industry, street traffic, school, home and farm.

Serving as a clearinghouse for all accident prevention activity, the National Safety council attempts to discover the facts

of accident occurrence; to devise or help devise engineering, educational and enforcement measures for prevention; to assist in determining engineering requirements for the safe design, construction and use of machines and equipment; to help formulate model safety legislation; to participate in planning and executing training and educational programs; to disseminate information to interested groups and to the general public, and to encourage and assist the establishment and functioning of community and state safety organizations. The council is chartered by the federal government.

Work Safety.—At the end of the first eight months of 1956 the occupational death toll was slightly less than in 1955. Deaths of this type in 1955 totalled 14,200.

Most progressive industries were engaged in vigorous safety efforts in 1956. Many of them carried their activities beyond the plant gates, both as a community obligation and because they realized that off-the-job accidents seriously disrupt in-plant operations.

The National Safety council conducted a special emphasis campaign in 1956 against roof fall accidents in mines, the chief cause of death and serious injury in mining. Such accidents dropped 29% during the campaign, with 122 of the 250 enrolled mines achieving a reduction of 50% or more. A follow-up survey six months later of a 50-mine sample showed an average reduction of 32%, proving the continuing effect of the campaign.

The success of this single-hazard approach prompted the launching late in 1956 of a nationwide campaign against falls, second only to motor vehicle accidents as an accident killer.

Traffic Safety.—During the first eight months of 1956, there were 25,350 motor vehicle deaths in the United States, an increase of 8% over the comparable period of 1955. The eight-month total was the largest for that period on record, the previous high

SAFE SEATING for automobile passengers, a design resulting from a joint study by Cornell Aeronautical laboratory and the Liberty Mutual Insurance company in 1956. A full scale model of the car was to be built in 1957

being in 1937. At the rate of increase, a new all-time high of between 41,000 and 42,000 was anticipated.

On a mileage basis the traffic accident picture also was unfavourable. Mileage was up about 6%, resulting in a mileage death rate (deaths per 100,000,000 mi.) of about 6.0, an increase from 1955.

In May 1956 the President's Committee for Traffic Safety sponsored four regional conferences, in Atlantic City, N.J., Miami, Fla., Chicago, Ill., and San Francisco, Calif., to stimulate the formation of state and city public support groups for traffic safety. During the summer, the State Safety Coordinators conducted a "Slow Down and Live" campaign. Late in the year the National Safety Council launched a "Back the Attack on Traffic Accidents" which was to continue through 1957, designed to stimulate public officials to more vigorous control measures and to enlist the support of citizens.

The council declined to grant its top award to any state or city for all-around traffic safety performance in 1955. However, Minnesota and four cities, Dallas, Tex., Seattle, Wash., Oklahoma City, Okla., and Palo Alto, Calif., were granted awards of merit.

Farm Safety.—Three more states organized state farm safety committees in 1955, bringing to 38 the number of states with functioning farm accident prevention organizations. Seventeen states had full-time farm safety specialists. These committees and individuals worked through many public and private agencies

to spread information on the farm accident problem and its solutions.

The Farm clinic, held in conjunction with the President's Occupational Safety conference in Washington, D.C., in May, drafted a set of farm safety recommendations which were being put into effect by the department of agriculture, co-operating agencies and farm organizations.

For the 13th consecutive year, the president of the United States proclaimed a National Farm Safety week, in July 1956, which focused attention on accidents to rural residents.

School and Child Safety.—Accidents rank first as a cause of death to children and young people from 1 to 24 years of age. Nevertheless, it is in this age group that the most dramatic reductions in the accidental death rate have been made.

For children under 5 years of age, the accidental death rate in 1956 for all types of accidents was less than half the rate at the turn of the century, while the motor vehicle rate alone was about 15% lower than the 1928-32 average rate, the highest on record. For children 5 to 14 years old the 1955 total rate was 51% less than the 1903-12 average, while the motor vehicle rate was about half the 1923-27 average, the peak for this age group.

Home Safety.—The 1955 death toll in home accidents in the United States was 28,000. The majority of the fatalities were among the very young and elderly persons. Falls were the chief cause. Estimates for 1956, based on the first eight months, indicated that home fatalities in 1956 would be slightly higher than in 1955.

A new home safety inventory plan to tabulate home safety activities and evolve standards of performance promised further progress in this field.

Canada.—In Canada there were 8,380 accidental deaths in 1954 (the latest year for which complete figures were available as of late 1956). This was a slight decrease in number, and a reduced average of 55.2 deaths per 100,000 population. As in the United States, accidents ranked fourth as a cause of death to persons of all ages. Motor vehicle accidents were the most important type in Canada in 1954, causing 2,867, or about 34% of all accidental deaths. Falls were second with 1,496 deaths. Other leading causes were: drowning, 1,107; burns, 513; railroad, 309, and poison gases, 176.

(See also DEATH STATISTICS; DISASTERS.) (M. E. Hr.)

ENCYCLOPÆDIA BRITANNICA FILMS.—*Anyone At All* (1954); *Casualty Insurance* (1954); *Insurance Against Fire Losses* (1952).

ACTH: see ENDOCRINOLOGY.

Aden. Aden is the name of a British colony and a protectorate on the south coast of Arabia. Governors in 1956: Sir Tom Hickinbotham and (from August) Sir William Luce.

Colony.—Area: 108 sq.mi., including Perim Island (5 sq.mi.) and Kuria Muria Islands (28 sq.mi.). Pop.: (1946 census) 80,876, Perim 360, Kuria Murias about 2,200; (1955 census) 138,441, excluding Perim (Arabs 75.2%; Indians and Pakistanis 11.4%; Somalis 7.7%). Languages: Arabic, also Indian languages and Somali. Religion: Moslem 91.3%, Hindu 3.5%. Chief towns (pop., 1955): Aden (Crater, etc.) 99,285; Sheikh Othman 29,879. Administration: governor; executive council; legislative council with equal official and nominated unofficial representation; Kuria Murias are administered for Aden by British Persian gulf residency.

Protectorate.—Area: about 112,000 sq.mi. Pop. (1955 est.): 800,000. Language: Arabic. Religion: Moslem. Administration: by rulers, with British political officers' advice.

Western Area.—Eight sultanates, one amirate, one sharifate and eight sheikhdoms. Total pop. (1955 est.): 450,000. Headquarters of adviser and British agent: Lahej (pop. about 12,000).

*Includes burns by fire and deaths resulting from conflagration, regardless of nature of injury; also burns by chemicals, steam, hot substances in 1948 (5th revision) and earlier years.

†Includes drownings in water transport accidents.

‡Comparable data not available.

Source: National Office of Vital Statistics, except that railroad estimates prior to 1933 are based on data from Interstate Commerce Commission. From 1903 to 1932 the other figures are estimates based on data for states in the official registration area. From 1933 to 1948 (5th revision) the figures are those published by NOVS plus National Safety Council estimates of falls in agricultural accidents and drownings in water transport accidents. 1949 to 1954 figures are NOVS totals. 1948 (6th revision) and 1955 figures are NSC estimates.

Premier chief, Ali Abdulkarim, sultan of Lahej; British agent in 1956, G. K. N. Trevaskis.

Eastern Area.—Seven sultanates and two sheikhdoms (including the Hadhramaut). Total pop. (1955 est.): 350,000. Chief towns: Mukalla (port; headquarters of resident adviser and British agent); Saiun; Tamridah (Socotra). Premier chief, Sir Salih bin Ghalib al-Qu'aiti, sultan of Shihr and Mukalla; British agent in 1956, Col. J. E. H. Boustead.

Kamaran (area 22 sq.mi.; pop. about 2,200) is in the Red sea off the Yemen coast. Governor, governor of Aden ex officio; commissioner in 1956, Lieut. Col. R. G. W. E. Alban.

History.—In March the governor met the rulers of the eastern and western protectorates to discuss the formation of some form of closer association between the various territories of each protectorate for their mutual assistance and support and to strengthen their internal economy and social organization. A statement signed in April by all the protectorate rulers who had attended the meeting affirmed their belief that the development and progress of their countries depended on close association and co-operation, and they welcomed the British government's assurance that they and their peoples would be free to negotiate among themselves the most appropriate form of association.

In the colony the development of Little Aden, where the new oil refinery was sited, was furthered by a British government loan of £4,000,000 repayable over 30 years. In August Sir Tom Hickinbotham was succeeded as governor by Sir William Luce.

Education.—(1954) *Colony:* Schools: primary 32, pupils 7,157, teachers 293; secondary (including one technical college with 150 students) 14, pupils 2,277, teachers 112. Teachers' training classes two, students 20. Aden college provides postsecondary education for men. *Protectorate:* Schools (excluding private): primary 107, pupils 7,110, teachers 288; secondary 6, pupils 400, teachers 30.

Finance and Trade.—Monetary unit: East African shilling valued at 14 cents U.S. Budget (1954–55): revenue £2,813,824; expenditure £2,929,079. Foreign trade (1955): imports £73,600,000; exports £62,700,000. Principal products (1955): salt, 275,000 long tons; salted fish. Entrepôt trade.

Adenauer, Konrad (1876–), German lawyer and statesman, was born at Cologne, Jan. 5. He was educated at the Gymnasium St. Aposteln, Cologne, and at the universities of Freiburg im Breisgau, Munich and Bonn.

In 1906 he was elected councillor and deputy mayor of Cologne, becoming lord mayor (*Oberbürgermeister*) in 1917. A leading member of the Catholic Centre party, he was a member of the Prussian *herrenhaus* from 1917 to 1918 and Prussian *staatsrat* from 1918 to 1933 (president 1928–33). He was dismissed by the nazis from the position of lord mayor in July 1933 and a year later was imprisoned for a short time during a drive against Catholic leaders. He was again imprisoned in 1944 after the attempt on Adolf Hitler's life. The U.S. occupation authorities made him mayor of Cologne in the spring of 1945, but in October the British, who had taken over the area, dismissed him, forbidding him to take part in politics; however, this prohibition was soon removed. A foundation member of the Christian Democratic union in Sept. 1945, he was president (1948–49) of the parliamentary council of the three western zones which drafted the constitution of the German Federal Republic. He became chancellor of the republic on Sept. 15, 1949.

Adenauer's chancellorship was marked by the substantial economic recovery of the republic and by renewed German participation in international affairs. Having triumphantly won the general election of Sept. 6, 1953, he remained federal chancellor. By signing in Paris, on Oct. 23, 1954, a series of agreements with the western powers, Adenauer succeeded in restoring German sovereignty, getting the right to rearm and obtaining membership in the North Atlantic Treaty organization (NATO) for the German Federal Republic.

On May 5, 1955, at Bonn, he presided over the ceremony of the formal attainment of sovereignty by the German Federal Republic. Four days later, in Paris, he attended a meeting of the NATO council at which the German Federal Republic joined the organization as its 15th member.

On June 5, 1956, at Luxembourg, together with Guy Mollet, the French premier, he signed an agreement on political integration of the Saar with the German Federal Republic. A few days later he visited the United States where on June 14 he conferred with Pres. Dwight D. Eisenhower. On Oct. 16 he reshuffled his cabinet; among others, he dropped his minister of defense, Theodor Blank, replacing him with Franz Josef Strauss.

In a foreign policy statement in November, he deplored the intervention of France and Great Britain in Egypt as an inadmissible use of force, and Soviet oppression in Hungary as a violation of the United Nations charter and of international law.

Adult Education: see EDUCATION; LIBRARIES.

Advertising. The year 1956 was marked in the United States by the rise of total advertising expenditures to almost \$10,000,000,000, by higher unit costs for advertisers, and by the imposition of various restrictions upon the operation of advertising mediums and agencies as the result of a federal antitrust action.

The estimated total investment in advertising in 1955 was \$9,194,400,000, or 12.6% more than in the year before. It was forecast that these expenditures might increase by \$800,000,000 during 1956, to reach a total of almost \$10,000,000,000 for the year. Estimates of advertising volume during recent years are as follows: 1950—\$5,710,000,000; 1951—\$6,426,100,000; 1952—\$7,156,200,000; 1953—\$7,755,300,000; 1954—\$8,164,100,000; 1955—\$9,194,400,000.

It was estimated that 59% of total 1956 expenditure was in national advertising, such as network television and radio, magazines, and in newspapers where the advertising was placed at national rates, as by advertisers other than local merchants. The breakdown of the total figure including both national and local advertising by expenditures in the various mediums was as follows: newspapers, 33.6%; magazines, 7.9%; television, 11.1%; radio, 5.9%; farm publications, 0.4%; direct mail, 14.1%; business publications, 4.9%; outdoor, 2.1%; miscellaneous, 20.0%.

Part of the increased volume of advertising resulted from higher charges for space and time. An estimate made at mid-1956 by Standard Rate and Data service revealed that time charges had been boosted by 146 television stations for an average increase of 21.6%; 487 newspapers had raised rates an average of 11.4%; 275 business publications had increased rates and 6 had

lowered them, but that the over-all average rise was 16.5%; and 100 consumer magazines had increased their rates while 11 were lowering them, the over-all rise being 14.1%. Radio was the only major medium showing an over-all reduction in rates, registering a drop of 6.7%.

Newspapers.—An estimate based upon a study by the Association of National Advertisers showed that the cost of reaching 1,000,000 newspaper readers in 1956 was 20% higher than in 1950, newspapers' rates having risen 28% during that period while circulations had gone up only 6%.

Advertising volume in newspapers in 1955 was \$695,000,000, a new high, and almost 17% greater than the \$594,120,000 total for 1954. In the first six months of 1956 the lineage of national newspaper advertising was 7.14% higher than for the comparable period of 1955.

The number of newspapers offering colour for run-of-paper advertising continued to increase, standing at 539 compared with 499 the year before. Colour lineage figures compiled for 50 leading newspapers in cities measured by Media Records revealed total lineage for 1955 nearly 30% higher than for 1954, with this rate of gain being maintained for the first three months of 1956.

Although there was considerable alarm over the possible effect of the newsprint shortage on advertising volume and other aspects of newspaper publishing, there were only scattered instances where papers had to reduce advertising for one or more issues because of lack of paper.

Paid circulation of daily papers exclusive of Sunday editions in 1955 was 55,837,834, compared with 54,860,429 in 1954. There were 1,963 dailies published, compared with 1,999 in 1954.

Magazines.—Magazine advertising volume and advertising rates continued to increase during 1956. The Magazine Advertising bureau reported that the increase in advertising volume in the first six months of the year was the largest on record, with gains of 7% in pages of advertising and 13.5% in revenue over the same period of 1955. The bureau expected that the volume of advertising of \$650,000,000 achieved in 1955 would be in-

creased by approximately \$100,000,000 in 1956.

A comparison with 1950 showed that by 1956 magazine costs to advertisers had risen faster than readers, with the result of an increase in cost per 1,000 circulation of 26%. Magazine circulations in general were 9% larger.

Crowell-Collier Publishing company ceased publication of the *American Magazine*, stating that its larger and more influential magazines duplicated the editorial function of the suspended publication. The Federal Trade commission ruled that the acquisition by *Farm Journal* of Curtis Publishing company's *Country Gentleman-Better Farming* was a violation of the antimerger provisions of the Clayton act, in that it eliminated one of only two substantial nation-wide general farm magazines, resulting in a tendency toward monopoly.

Television and Radio.—Advertising volume in television was estimated at \$1,005,000,000 in 1955, compared with \$803,600,000 in 1954. Of this total, approximately half was spent in network and half in spot and local television. Data issued by the Television Advertising bureau showed that 3,000 national and regional advertisers spent a total of \$103,872,000 in national and regional spot television in the last three months of 1955, and that 2,702 invested \$100,209,000 in the first quarter of 1956. These estimates of the bureau were for time and facilities only.

According to the Advertising Research foundation, 73% of households had television in 1956, or 35,495,330 of the 48,784,600 U.S. total. The number of television stations operating commercially was set at 427 at the beginning of 1956, compared with 410 as of May 1, 1955.

The audiences of network television had grown rapidly, with the result that the cost to the advertiser per million home hours of television viewing was calculated in 1956 at little more than a third of what it was in 1950, although the average hourly rate had almost quadrupled during that time. The index of home hours of television use in 1956 was estimated at 1,054, compared with 100 in 1950.

Colour television was not selling so rapidly as had been expected. A poll of customers showed that most objections were based upon high price of sets, defect in colour and inadequate colour programming.

The Station Representatives association reported that national spot time sales of radio reached \$10,601,000 in Aug. 1956, or 28.5% ahead of Aug. 1955. For the first eight months of 1956, spot radio was 21.5% ahead of the comparable period for 1955, standing at \$86,366,156.

Network radio continued its decline. The volume of advertising in this medium was estimated at \$90,000,000 in 1955, compared with \$114,500,000 in 1954. Competition with television was causing cuts in network radio rates, with the result of reducing the cost to the advertiser of an hour of network time by about 44% since 1950. However, the reduction in the home hours of radio listening per day caused a slight rise of 2% in the cost to the advertiser per million home hours of listening.

Other Mediums.—Direct mail was expected to reach a volume of \$1,750,000,000 in 1956, an increase of \$250,000,000 over 1955, according to the Direct Mail Advertising association. A bill to increase postal rates failed of passage in the 84th congress.

Business publications also improved their advertising volume during the year, and it was estimated that \$440,200,000 would be invested in this medium during 1956. With the inclusion of about \$50,000,000 additional in production costs, the total figure would total 10% more than in 1955. It was announced by Printers' Ink Publishing company that the magazine *Printers' Ink*, founded 68 years earlier, would be acquired by a nonprofit foundation.

Outdoor advertising in 1955 touched a record high of \$114,-

"DON'T YOU HAVE SOMETHING THAT JUST SMELLS NICE AND LADY-LIKE? . . . I'm a little old for all this action!" a 1956 cartoon by Lichty of the Chicago Sun-Times syndicate

464,812, compared with \$111,500,000 the year before. During the year there was a merger of Outdoor Advertising, Inc., and the Standard Group of Outdoor Advertising companies, both organizations having been engaged in the selling and promotion of the medium.

Advertising Agencies.—The bureau of the census issued data on advertising agencies that it had collected in the 1954 census of business. Different techniques in enumeration and compilation invalidated some comparisons with data from the 1948 census of business. However, it was indicated that the number of agencies with payrolls increased from 2,906 in 1948 to 3,268 in 1954, a rise of 12.5%, and that the number of paid employees rose from 38,739 to 46,046 during these six years. The total number of agencies was given as 5,077, compared with 3,279 in 1948.

It was found that New York contained almost one-fourth of the agency establishments, followed by California with 11.8%; Illinois, 10.7%; Pennsylvania, 6.1%; Ohio, 5.8%. The 10 leading states accounted for 74.7% of all establishments and 91.3% of all agency receipts.

Advertising Research.—The Advertising Research foundation published its study on Printed Advertising Rating Methods, the study having been carried out by Alfred Politz Research, Inc., under foundation auspices. It concerned the three major methods of measuring impressions left on readers of printed advertisements, specifically those in a single issue of *Life*. The methods studied were aided-recall, of Gallup-Robinson; recognition, of Starch; and reader-interest, of Readex.

A survey by the Association of National Advertisers showed that the positioning of newspaper advertisements is considered of importance by 92% of the 133 member companies of the association reporting on the subject. The study showed that 88% of the companies make requests for particular positions on all or most of the advertising they place. However, readership findings from Advertising Research foundation studies which supplemented those of the A.N.A. investigation show that readership is from 2% to 4% higher for left-hand pages, whereas most advertisers request positions on right-hand pages.

Government.—During the year consent decrees were signed by the American Association of Advertising Agencies and five associations of mediums as the result of an antitrust action instituted by the government in May 1955, in which the associations were charged with collusion and conspiracy in restraint of trade. First the American Association of Advertising Agencies agreed to the terms of the decree, in which it was restrained from taking any action toward fixing, establishing or stabilizing agency commissions; requiring or advising any advertising agency to refrain from rebating or splitting agency commissions; and requiring, urging or advising any advertising agency to refrain from submitting advertising copy, art work, illustrations or similar material to advertisers in the solicitation of new accounts.

The American Newspaper Publishers association also signed a consent decree in which it was enjoined from establishing or stabilizing agency commissions or attempting to do so; urging any agency to refrain from rebating or splitting agency commissions; requiring or urging any medium to deny or limit credit or agency commission due or available to any advertising agency; requesting any medium not to do business with or not to recognize any advertising agency. Similar decrees were imposed upon the other mediums that were parties to the suit.

This victory for the government touched off a debate among advertisers, agencies and mediums as to the justification of the traditional 15% agency commission. The Association of National Advertisers formed a committee to study the whole question of agency compensation.

ADVERTISING STUNT In San Diego, Calif. During a gasoline sales price war in 1956, one service station owner prepared the dummy prop on the right and placed it in the engine compartment of an old car to attract customers

Canada.—In 1956 Canada enacted a 20% tax on advertising in Canadian editions of United States magazines, effective Jan. 1, 1957. It was calculated that the tax would produce \$1,500,000 revenues for Canada. 80% of this from *Reader's Digest* and *Time*. It was expected that the U.S. magazines would raise their rates as the result.

Aeronautics: see AVIATION, CIVIL; AVIATION, MILITARY.

Afghanistan. An independent kingdom in central Asia, Afghanistan is bounded north by the U.S.S.R., west by Iran, south and southeast by Pakistan and east by China. Area: about 251,000 sq.mi. Pop. (1953 est.; no census ever taken): 13,000,000. Races: Pakhtu or Pathan 60.5%, Tajik 30.7%, Uzbek 5%, Hazarah (Mongoloid) 3%. Languages: Pakhtu and Persian. Religion: Sunni (Hanafi) Moslem. Chief towns (pop., 1953 est.): Kabul (cap.) 310,000; Kandahar 195,000; Herat 150,000; Mazar-i-Sharif 100,000. King, Mohammed Zahir Shah. Prime minister in 1956, Mohammed Daud Khan.

History.—On Dec. 18, 1955, during the visit to Kabul of N. A. Bulganin, the Soviet premier, and N. S. Khrushchev, first secretary of the Communist party of the Soviet Union, a protocol was signed extending for ten years the Soviet-Afghan treaty of neutrality and nonaggression of 1931. On the same day it was announced that the U.S.S.R. granted to Afghanistan a 30-year credit of \$100,000,000 at an annual rate of interest of 2%.

On Jan. 28, 1956, a joint Soviet-Afghan statement said that the U.S.S.R. would ensure delivery of "equipment and materials" on account of this credit, and would also grant "other services connected with technical assistance in building certain installations" in many branches of Afghan economy.

According to Pakistani sources, \$40,000,000 of the Soviet credits was earmarked for arms from the U.S.S.R. and Czechoslovakia and \$60,000,000 for building airports and roads.

On his way to India, A. I. Mikoyan stayed in Kabul on March 21-22. Adnan Menderes, the Turkish prime minister, paid a five-

day visit to Afghanistan in July. In August Maj. Gen. Iskander Mirza, the president of Pakistan, stayed four days in the Afghan capital. It was believed that both Menderes and Mirza discussed at Kabul the possibility of Afghanistan's joining the Baghdad pact, the problems of the Pathan or Pakhtu tribesmen and their aspiration for a "Pakhtunistan" state.

On Jan. 27 King Zahir approved the new cabinet still headed by Mohammed Daud Khan, a king's cousin, who also held the portfolio of defense; Naim Khan, another king's cousin, continued as foreign minister and second deputy premier; Ali Mohammed Khan became first deputy premier. Daud had thus finally succeeded in ousting from the government the supporters of Gen. Mohammed Arif, minister of defense, who had been dismissed and put under arrest at the beginning of Dec. 1955. At the same time more than 70 other persons, both army officers and civilians, had also been arrested.

Education.—Schools (1955): primary 360, pupils 210,000; secondary 25, pupils 22,000; vocational 7, pupils 1,850; teacher training 4, students 2,460. Students at institutions of higher education (including University of Kabul) 2,700 in 1955.

Finance.—Monetary unit: afghani, with an exchange rate of 16.80 afghani to the U.S. dollar. Budget (1954-55 est.; 1955-56 est. in parentheses): revenue 746,000,000 afghanis (878,000,000 afghanis); expenditure 1,141,000,000 afghanis (1,301,000,000 afghanis). Currency circulation: (March 1954) 922,000,000 afghanis (March 1955) 1,083,000,000 afghanis. Deposit money: (March 1954) 415,000,000 afghanis (March 1955) 885,000,000 afghanis.

Foreign Trade.—(March 1954-55): imports 1,000,000,000 afghanis, exports 1,403,000,000 afghanis. Principal imports (chiefly from U.S., German Federal Republic, Pakistan, India, U.S.S.R.): sugar, cotton textiles, building materials, petroleum products. Principal exports (chiefly to India, Japan, U.S., German Federal Republic, Pakistan, U.S.S.R.): karakul (Persian lamb) skins (2,000,000), cotton (12,500 metric tons), carpets (150,000 m. in 1952), wool, fresh and dried fruit.

Transport and Communications.—Roads (1955): 5,111 km., gravel. Motor vehicles in use (1952): passenger 880, commercial 4,360. Telephones (Jan. 1955): 8,452. Radio receiving sets (1955): 25,500.

Agriculture.—Production (metric tons, 1955; 1954 in parentheses): cottonseed 39,000 (39,000); lint cotton 20,000 (20,000); raw beet sugar, 6,000 (6,000); wool (clean basis) 3,000 (3,000); rice (1954) 270,000 (330,000 in 1948); wheat (1954-55) 2,100,000 (2,320,000 in 1953-54); maize (1954-55) 664,000; barley (1954-55) 279,000. Livestock (1952, standing estimate): horses 500,000; asses 1,000,000; mules 200,000; cattle 2,500,000; sheep 14,000,000; goats 6,000,000; camels 350,000; chickens 40,000,000.

Industry.—Production (census 1954-55): refined sugar 5,487 metric tons; cotton textiles 17,280,000 m. Electricity (Kabul and vicinity, 1954-55) 9,900,000 kw.hr. Total annual installed capacity 14,000 kw.

Agricultural Research Service. This agency conducts all of the U.S. department of agriculture's production and utilization research (except forestry research) and crops and livestock regulatory programs. Much of its work is co-operative with other federal, state or private agencies.

Crops Research.—A rare and little-known substance, gibberellic acid, offered unusual possibilities as a growth-regulating chemical. A single application of minute amounts doubled or tripled heights of various kinds of plants.

It was shown that two insects, the peach aphid and the potato aphid, can transmit internal cork virus from diseased to healthy sweet potatoes. A quick, positive way was found to check plant breeding lines and commercial varieties for their immunity or resistance to the disease.

Productive single-germ hybrids of the sugar beet were developed for the first time, giving promise of complete mechanization of sugar-beet production. A system of inheritance was discovered in castor beans that resembles, in effect, the male-sterility character used so successfully for breeding high-yielding and disease-resistant varieties of onions, sorghum, sugar beets and other crops.

A new systemic insecticide, Dow ET-57, administered orally in capsule form, showed promise for control of the cattle grub, but further investigations were needed.

An outstanding repellent was discovered that was highly effective against mosquitoes, stable flies, deer flies, ticks, fleas and chiggers.

The only nematode known to be beneficial to plants was found to transmit a bacterial disease that is highly destructive to several injurious insects, among them the codling moth, corn earworm and pink bollworm. Several virus diseases proved potentially capable of controlling tent caterpillars, corn earworm and cabbage looper. The Virginia pine sawfly was readily infected by a virus sprayed on pines by aeroplane.

Crops Regulatory Programs.—Within ten days following discovery on April 13, 1956, of the Mediterranean fruit fly, a destructive fruit and vegetable pest, in Florida, manpower and equipment were being mobilized for an all-out federal-state eradication effort. Two powerful new weapons, developed through U.S.D.A. research in Hawaii, were in use—an attractant bait-insecticide spray, and an effective lure for male flies eventually used in about 35,000 survey traps over the state.

Aircraft sprayed DDT on almost 1,000,000 ac. of land in ten northeastern states during the summer in a federal-state effort to halt the southerly advance of the gypsy moth and to cut down its numbers.

Plant quarantine inspectors intercepted at U.S. borders about 17,500 lots of material containing dangerous plant pests—insects, nematodes and diseases. For the past few years, passengers on 38% of the planes and 27% of the vessels had carried unauthorized plant material.

Livestock Research.—U.S.D.A.'s long-awaited, critically needed Plum Island (New York) Animal Disease laboratory, a \$10,000,000 research building, was dedicated in September. One strain of foot-and-mouth disease virus was propagated at Plum Island in cultures of kidney cells, affording an economical and controllable source of material for fundamental studies.

Seeking to develop meatier hogs, U.S.D.A. scientists found that Duroc and Yorkshire hogs selected for high backfat thickness by the probe method generally were shorter, lower and wider of body than those selected for low backfat thickness. By putting animals to sleep with certain anaesthetics, researchers were able to correlate length of their sleep with fat content. The shorter the sleep, the more fat. This unique method held potential significance in beef and pork marketing.

Feeding stilbestrol experimentally to dairy cows did not increase milk production or efficiency of feed utilization. Dairy herd improvement and sire-proving work was at its highest level in history, with more than 1,400,000 cows on Standard Dairy Herd Improvement association test. They had an average production of 9,363 lb. of milk and 372 lb. of butterfat, an all-time-high level of production. Daughters of proved sires averaged 10,236 lb. of milk and 415 lb. of butterfat, as against the national average for all cows of 5,815 lb. of milk and 232 lb. of butterfat.

Livestock Regulatory Programs.—The accelerated program to eradicate bovine brucellosis began to pay dividends. By June 1956, five states were certified as modified brucellosis-free, with about 20 others aiming for the same status in their dairy and beef cattle herds during the next five years. Incidence of the disease declined more than one-fifth during the first 18 months of the intensified campaign, with tests showing that less than 2% of all U.S. cattle remained infected. The fact that 89% of the reactors found were reported slaughtered showed that owners were becoming more convinced that it is unprofitable to permit brucellosis to remain in their herds.

Selected veterinarians, U.S.D.A.-trained in the differential diagnosis of vesicular diseases, were located strategically through-

out the country and placed on call 24 hours a day. They constituted a vital first line of defense against the dread foot-and-mouth disease—should it again invade the country—as well as against animal diseases already in the United States.

An animal disease reporting system was inaugurated in Jan. 1956 to collect and disseminate to veterinarians throughout the country information on occurrence of important animal diseases. This system proved a valuable aid in planning and directing animal disease eradication programs.

Utilization Research.—Potato flakes that form mashed potatoes when mixed with hot milk or water were market-tested, and a number of processors were considering commercial production. A new two-stage cooking procedure controlled texture of the product to meet geographical preferences and also made possible use of eastern potato varieties previously considered unsuitable. Research-developed equipment for superdrying dehydrated mashed potatoes was now used by all United States potato-granule manufacturers. Potato puffs and bars made from crushed potato chips were also developed.

A new treatment for making wool permanently shrink-resistant, even after repeated washings, chemically anchors small amounts of a resin to the wool structure. Evaluation of the process for commercial use was under way. Another new chemical treatment increases wool's resistance to acids and caustics without affecting its other characteristics. Research made progress in producing wool that is softer, better able to hold creases and pleats, less easily discoloured and more resistant to soil, moths and micro-organisms. A sound analyzer, the "rustleometer," helped to evaluate "handle" or feel, by which experts judge drape, softness, warmth and texture of wool fabric.

Home Economics Research.—An energy-saving kitchen workroom was designed for ill or aged housewives. It requires fewer steps, less reaching and standing.

A daily food plan developed for use in nutrition programs presented a four-food-group point system rating common foods as nutrient sources.

Certain nutrients consumed by people in specific age groups were studied to establish standards and spotlight deficiencies in nutrition—the amino-acid requirements of young women, children's requirements for fatty acids, and the milk- and variety-deficient meals of older low-income families.

Useful to both homes and institutions were studies on correct use of detergents in laundering, on properties and serviceability of household and clothing fabrics, on home freezers, on bread, on edible yields of market-purchased foods and on waste of fat beef from packing plant to dinner table to garbage can.

Farm and Land Management Research.—Agricultural engineers developed mechanical means of doing farm jobs more efficiently—among them a bladeless potato digger, a moisture-measuring instrument for use in drying grain, a seed reclaimer to reduce losses from shattering, electric insect traps and a cell for measuring pressures in soil.

New systems helped increase farming efficiency—corn "ridge farming" for humid areas, "land forming" for sugar cane fields, a three-team apple-picking method, and handling of apples in bulk boxes with fork-lift equipment.

A simplified hooded-pipe spillway was developed that was expected to save hundreds of thousands of dollars a year in dam and reservoir construction costs.

With drought still the primary agricultural problem in many areas, research on conserving soil and water assumed increasing importance. Plans were made for launching a nation-wide, three-year inventory of soil and water conservation needs, county by county. An analysis of 20 years' accumulated watershed data from 27 states, a nation-wide summary of soil and water loss data and studies of the frequency and intensity of droughts over

a 25-year period in several states were under way.

ENCYCLOPÆDIA BRITANNICA FILMS.—*Antibiotics* (1952); *Atom and Agriculture* (1953); *Improved Strains of Livestock* (Applications of Genetic Principles) (1954); *Science and Agriculture* (1953).

Agriculture. Despite extensive acreage and marketing controls, a late, wet spring in the northeast, a severe and widespread drought in the Great Plains, and diversion of more than 12,000,000 ac. of cropland to the acreage reserve phase of the soil bank, early indications of crop reductions were mostly revised upward after midsummer, and 1956 proved to be a very productive agricultural year in the United States. Total crop production was only slightly below the record production of 1948. The wheat harvest was 975,517,000 bu., in spite of reduced acreage, marketing quotas and drought, 3% more than 1955 but 16% below the high average for the previous decade. The second largest corn crop on record of 3,412,183,000 bu. was produced on the smallest acreage harvested in the 20th century; corn did much to balance the smaller production of other feed grains. In spite of significantly smaller oat and barley crops and a sharply reduced grain sorghum crop of 169,815,000 bu., as compared with a record 241,100,000 bu. in 1955, total feed grain production was indicated at about 127,000,000 tons, only 2% below the big 1955 crop. The hay crop of 110,383,000 tons, the second largest of record, included an all-time high of 59,536,000 tons of alfalfa.

The new record soybean crop of 457,394,000 bu., 23% more than the previous record crop of 1955 and 80% above average for the previous decade, plus a linseed crop one-fourth larger than in 1955, did much to counterbalance an 8% reduction in peanuts and a 10% reduction in the cottonseed crop. Reduction of about 16% in the rice crop lessened surplus pressure.

Total deciduous fruit production was about 1% smaller than in 1955; the peach crop was notably improved. Tree nut crops were about 6% more plentiful than in the previous year. Larger vegetable crops than in 1955, especially of processing vegetables, did much to hold the line on food prices. The indicated white potato crop was 11% larger than in 1955, but sweet potatoes were about one-fifth less abundant than average. The sugar beet crop increased to a level 8% above 1955 and 18% above the average for 1945-54, but the sugar cane crop was reduced about 10% by unfavourable weather conditions in Louisiana. The tobacco crop of 2,124,767,000 lb., grown on 8% fewer acres than in 1955, provided some new record yields, especially of the important flue-cured type.

Livestock Production.—Livestock and poultry on U.S. farms and ranches at the beginning of the year showed a net increase of nearly 2%, as compared with 1955, but were 7% below the

Table I.—U.S. Production and Yield Per Acre

	1956*		1955

*Indicated figures.

record level of Jan. 1944. Meat animals (cattle, hogs and sheep) increased 2%, whereas milk cattle were down about 1%, poultry about 2%, and the now only slightly significant work stock were down 8%. Hogs and stock sheep declined in price per head and in total value, cattle showed little change, and other types showed some increase. Production rates for most products continued at record or near record levels.

Total cattle reached a new high level of 97,465,000 head at the beginning of the year, thus continuing the expansion phase of the cycle begun in 1949, and repeated for the sixth time since 1880. The increase was in beef cattle; milk cows declined to the second lowest level since 1930. The 1956 calf crop was indicated at 43,272,000 head, 1% more than the 43,001,000 calves born in 1955. Though cattle slaughter in the first half of 1956 averaged about 4% above the corresponding period of 1955, it included more steers, slightly more heifers and fewer cows. With no major liquidation of breeding cattle resulting from the Great Plains drought, it appeared that cattle numbers were near stability at a very high level, leaving open the important question of when the anticipated declining phase of the cycle might begin.

Milk production continued at a record high rate, the increased feeding of concentrates and improvement in quality of dairy stock outweighing the decline in dairy cow numbers.

Hogs, of which 55,088,000 head were on U.S. farms at the beginning of the year, as compared with 50,474,000 head a year earlier, declined during 1956. The 1956 spring pig crop totalled only 53,085,000 head, a decline of 8% from the spring of 1955. These, plus about 35,000,000 fall pigs, gave a total of about 88,000,000 as compared with 95,604,000 in 1955. The decrease resulted from a severe decline in hog prices in 1955 together with a continued unfavourable corn-hog price ratio which in September stood at 10.8 as compared with an average of 13.5 for the decade 1945-54.

Stock sheep on farms and ranches declined slightly to 27,009,000 head at the beginning of the year, from 27,137,000 a year earlier. However, the number of breeding ewes was somewhat increased and the 1956 lamb crop was indicated at 20,428,000, as compared with 20,187,000 in 1955. Shorn wool production of 232,000,000 lb. was 1% less than the 1955 clip, in spite of a government wool incentive payment of 44.9% of the average price received on the open market, bringing the total to about 62 cents per pound for grease wool. The same rate was announced for 1957.

About 382,218,000 chickens were on farms at the beginning of the year, as compared with 390,708,000 a year earlier. Turkeys also showed some decrease, to 4,892,000 head from 4,917,000 head. Broiler production continued in 1956 at a record level, exceeding 1955 by perhaps 20%. Egg production also exceeded that of 1955 by a small margin. Turkeys raised were 76,300,000 head, 10% more than the 65,600,000 of 1955. Heavy breeds were up 29% over the previous year, and light-breed birds down 19%.

Table II.—Index Numbers of U.S. Farm Output, Gross Production of Livestock and Crops, by Major Groups
(1947-49=100)

Source: Agricultural Research Service and Agricultural Marketing Service, U.S. Department of Agriculture.

In more than 600 counties the drought situation after mid-1956 became so serious that, in order to keep breeding herds intact, farmers were permitted to graze their livestock on land designated for the acreage reserve of the soil bank. In addition, government-held surplus feeds were provided under subsidy and transportation costs reduced.

Agricultural Stocks and Foreign Trade.—Stocks continued to be superabundant in 1956, though considerable progress was made in export.

The size of stocks may be in some degree surmised from the Commodity Credit corporation (CCC) holdings or commitments of \$8,257,308,000 total value on June 30, remaining after vigorous disposal efforts. In quantity terms, carry-over stocks included 1,022,000,000 bu. of wheat and 14,100,000 bales of cotton, amounting approximately to a large crop of each, with little apparent likelihood of major reduction in the year ahead. Corn carry-over was also at a record level of about 1,200,000,000 bu., but dairy products and fats and oils, formerly at worrisome levels, were much reduced; special sales of butter stocks were discontinued. The surplus of feed grains, other than corn, was somewhat reduced. Hogs, in substantial surplus early in the year, were cut back, but cattle remained at or near record levels. The CCC was authorized to buy up to 100,000,000 bu. additional of grain storage bin capacity. On balance, pressure for surplus disposal did not abate, but mounted during 1956. Distribution, sale at market prices, triangular arrangements, and an International Food Commodity board were proposed.

U.S. agricultural exports in 1955-56 were valued at \$3,475,000,000, a 10% increase over the \$3,145,000,000 of 1954-55. In quantity, shipments increased by 13%, to the third largest total since 1925. Grain and feed exports, spurred by winter damage in Europe and sales under public law 480, were increased by 33% over the previous year, to \$1,170,000,000. Wheat exports of 345,000,000 bu. were the largest in four years, and feed grain exports were a record 8,300,000 tons, 84% more than the 4,500,000 tons of 1954-55. Vegetable oils and oil-seed exports increased 32% to \$400,000,000; exports of 69,000,000 bu. of soybeans and 1,000,000,000 lb. of cottonseed and soybean oils set new records. Tobacco outgo increased by 24% to \$380,000,000; livestock products by 18% to \$545,000,000; and fruits and vegetables by 19% to \$325,000,000 (fresh oranges set a new record of 1,330,000,000 lb.); but cotton lagged seriously, declining by 55% to \$375,000,000, as compared with \$684,000,000 in 1954-55. Japan, the United Kingdom, Canada, the Netherlands, and western Germany were the best customers for U.S. agricultural surplus, taking nearly half of the total exports in 1955-56.

Agricultural exports under government programs accounted for about \$1,316,000,000, or 38% of the total, in 1955-56. Exports under title I of public law 480 were 3,599,287 metric tons. Barter contracts totalled approximately \$315,800,000, as compared with \$281,800,000 the previous year. Donations of surplus foods were 2,015,200,000 lb., about 95% more than in 1954-55. In the early part of fiscal 1956-57, farm exports were nearly 25% larger than for the same months of 1955.

Total agricultural imports in 1955-56 were valued at \$4,080,376,000, as compared with \$3,779,604,000 in 1954-55. Supplementary products were valued at \$1,581,128,000, of which sugar valued at \$440,524,000 was a major item. Coffee accounted for \$1,450,796,000, more than half of the complementary total of \$2,499,248,000, and rubber for another \$453,368,000. Increased imports of Polish ham and Japanese cotton textiles were widely controversial during 1956, as was cargo preference legislation on agricultural exports. Attempts to further restrict dairy products imports, especially some types of Italian cheeses, were overruled.

Farm Product Prices.—A five-year decline was interrupted by generally rising market prices for farm products during the first half of 1956, after which prices again dipped. The index of prices received, which stood at 223 in Dec. 1955 (1910-14=100), had by June 1956 rebounded to 247, which was, nevertheless, far below the record 313 of Feb. 1951. By October it had dipped to 234, causing no little concern as hog and crop marketings underwent the usual seasonal increase. Meanwhile, the index for food in the consumer price index in September rose to 113.1 (1947-49=100), as compared with 111.4 a year earlier, but was 3% below the Aug. 1952 peak level. The farmers' share of the retail food dollar increased slightly from the 39-cent average for the first quarter of 1956.

Farm Income.—Farmers received about \$17,100,000,000 from marketings in the first eight months of 1956, 2% more than in the corresponding period of 1955. Increase in the volume of marketings more than offset a 2% decline in average prices. Receipts from livestock and products were approximately \$10,400,000,000, slightly more than in 1955. Crop receipts of \$6,700,000,000 were up 3%, as compared with the same period of 1955.

Prices paid by farmers for commodities, interest, taxes and wages involved in farm production (the parity index) stood at 287 in October, as compared with 280 a year earlier, and a record high of 290 in May 1952. A few products, mostly those which some farmers purchase from other farmers, were less costly.

The parity ratio, which measures prices received in relation to costs sustained, stood at 82 in October, the same as a year earlier and compared with the record high, representing the most favourable condition for farmers, of 123 in Oct. 1946. It was preliminarily estimated that farmers' realized net income for 1956 would slightly exceed the \$11,700,000,000 of 1955; the peak was \$16,774,000,000 in 1947.

Farm Values and Finances.—Somewhat paradoxically, in view of the recession in farm income, demand for farm land continued strong in 1956. The annual removal of more than 1,000,000 ac. of land from agricultural to industrial, residential and road uses contributed to the demand. The average value of U.S. farms in July was 3% higher than a year earlier, rising to a new record high of 140% of the 1947-49 base. Total estimated value of land and building in March was \$102,412,000,000, up from \$98,500,000,000 in 1955; buildings accounted for \$24,293,000,000. The average per acre value was \$88.40, as compared with \$85 a year previous. The value of all farm assets in the U.S. stood at an all-time peak of \$170,100,000,000 at the beginning of 1956. The increase from Jan. 1, 1955, of \$3,600,000,000 or 2% was accounted for by an increase in farm real estate from \$98,800,000,000 to \$102,700,000,000. Though much of this was, strictly speaking, a book value tied to the farm real estate market, proprietors' equities were \$151,300,000,000, as compared with \$148,800,000,000 a year earlier.

Total farm mortgage debt outstanding at the beginning of the year was estimated at \$8,962,000,000, the highest since 1932 and the tenth consecutive year of increase, up 10% from a year earlier. The increase was estimated at a somewhat lower rate during 1956. Interest rates averaged 4.8%, slightly higher than a year earlier.

Short-term credit, including CCC loans, also was used in larger amounts, the non-real estate debt rising to \$7,900,000,000 as of Jan. 1, 1956, up 8% as compared with a year earlier.

Farm Labour.—About 10,428,000 persons were working on U.S. farms during the autumn harvest of 1956, 4% fewer than a year earlier. The number of hired workers, 2,926,000, was slightly larger than in 1955, the over-all decrease being entirely accounted for by fewer family workers. Farm wage rates averaged 5% higher than a year earlier. The average wage of hired labour was \$6 per day without board or room for a workday of about

CRUSHED ICE being sprayed on young cotton plants, the first step in a study of hail damage to cotton crops, an experiment conducted in 1956 by Texas A. & M. college. Results indicated that farmers did not need to plow under and replant if hail strikes the crop early in its growth

nine hours, or \$161 per month with house.

Farm Costs—Machinery, Fertilizer, Taxes, etc.—Prices paid by farmers for industrial commodities, farm wage rates, taxes and interest were higher in 1956, whereas prices paid for feed, seed and livestock, though lower, tended to increase as the year advanced, the parity index advancing from 279 in Dec. 1955 to 287 in Oct. 1956. Small chance of a decline in costs, to offset depressed income, was foreseen.

Farm machinery shipments were about 15% below 1955 in dollar value. Farm machinery prices, 4% higher in March 1956 than a year earlier, were generally increased later in the year because of rising costs. Meanwhile, it became increasingly evident that mechanization of agriculture had resulted in some problems, particularly with respect to capital requirements and debt as well as efficient unit size of operation. Electric power, a cash expense, turned to profitable use on many farms, was reported as available to nearly 95% of U.S. farms.

Fertilizer costs were down about 2%, as compared with the previous year. Yet the post-World War II boom in fertilizer use, which increased consumption in 1955 to record levels nearly 4%

GROSS FARM INCOME: net income and production expenses of U.S. farm operators, 1925-56, including government payments from 1933. Compiled by U.S. bureau of agricultural economics. Data for 1956 are estimates

over the previous year, was reported as fading, with some producers cutting output as sales showed a larger than seasonal dip. The use of higher-analysis fertilizers continued to increase. Agricultural chemicals used were valued at perhaps \$200,000,000 at the manufacturer's level.

Interest paid by farmers increased by 7% as compared with 1954, to \$950,000,000 in 1955; a larger rise was indicated for 1956 as a result of increased borrowing and higher interest rates. Property taxes paid by farmers to state and local governments were indicated as at least 3% higher than in 1955, when levies totalled about \$927,000,000. Taxes payable by farmers on employees in 1956 were indicated as about three times as high as in any previous year—a result of increased coverage of hired farm workers under the federal old age and survivors program.

Commodity Credit Corporation.—Price supports extended on 1955 crops through June 30, 1956, were about 20% larger than for the previous year; of the total of \$3,519,000,000 loans were \$2,967,959,115, purchase agreements \$288,211,271 and purchases of commodities not under purchase agreements amounted to \$262,844,271. Leading items among 1955 crops supported, in order of value, were: cotton, 7,200,000 bales and \$1,177,200,000; wheat, 320,000,000 bu. and \$656,900,000; corn, 420,700,000 bu. and \$650,900,000; tobacco, 364,400,000 lb. and \$241,000,000; and rice, 26,300,000 cwt. and \$139,100,000. Of the more significant 1955 crops, 49.1% of the rice, 49% of the cotton, 44.1% of the grain sorghums, 42.7% of the rye, 34.1% of the wheat, 23.9% of the barley, 20.8% of the flaxseed, 20.5% of the beans, and 13% of the corn, were extended support.

The net realized program loss on price-support operations for the fiscal year ended June 30, 1956, was \$974,767,365, as compared with \$799,061,464 for the previous fiscal year. Including some other items, the resulting net loss from operations, expenses and increases to reserves totalled \$1,335,782,753.

In addition, the Commodity Credit corporation was reimbursed in full for surplus commodities valued at \$459,281,096 disposed of in fiscal 1956 under titles I and II of public law 480, the Agricultural Trade Development and Assistance act of 1954.

Total investment in commodities in price-support inventory or pledged for outstanding loans at the end of fiscal 1956 was \$8,257,308,000, as compared with \$7,069,277,000 a year earlier. The borrowing power of the CCC on Aug. 1 was increased to \$14,500,000,000 from \$12,000,000,000, by public law 864. As of April, nearly all of the \$12,000,000,000 was pledged. In the autumn of 1956, it appeared that record amounts of corn, soybeans and cotton would seek shelter under the support program.

Legislation and Administration.—Even before the second session of the 84th congress began in Jan. 1956, it was indicated that the agricultural situation had become sufficiently critical, economically and politically, to guarantee major remedial at-

tention. The program as finally enacted was in its general emphasis fairly close to what had been requested by the administration.

The Agricultural act of 1956 approved May 28, provided for a soil bank in two phases. The Acreage Reserve program authorized payments to farmers for reducing production of the six basic crops, by reducing crop acreage below the farm acreage allotment. This program, voluntary in nature except for corn, was to begin with 1956 and extend through 1959. Over-all limits on the program were set at \$750,000,000 per year with specified limits for each commodity. Civil penalties were imposed for violation of prohibition against cropping or grazing. Corn constituted a special case in 1956, with a referendum vote of farmers to be held late in 1956 to determine the nature of the program for subsequent years.

This part of the program got under way on June 8, and about 12,300,000 ac. were contracted. Corn farmers signed 270,161 agreements covering 5,450,194 ac., with maximum possible payments of \$180,629,284; wheat farmers, 162,574 agreements covering 5,654,507 ac. for possible payments of \$44,490,882; cotton farmers, 95,954 agreements on 1,113,789 ac. for a possible \$27,281,778 payment; tobacco farmers, 19,994 agreements covering 31,671 ac. for possible payments of \$6,618,699; peanut growers, 5,303 agreements on 43,645 ac. for a possible \$591,437 payment; rice growers, 1,112 agreements on 28,003 ac. for possible payments of \$1,386,667. The grazing restriction was removed later in the year on many reserve acres in drought-stricken areas. Approximately 10,000,000 ac. of winter wheat acreage were contracted for the 1957 reserve.

The second phase, the conservation reserve, was not officially opened until Aug. 16, and was expected to apply mostly to years after 1956. The secretary of agriculture was authorized to enter into contracts with agricultural producers, not restricted to producers of the basic crops, for a minimum period of three years and a maximum period of ten years (15 years in the case of tree cover), under which the producer would devote a designated part of his crop land to conserving uses, trees, grass or water facilities, agreeing not to pasture or harvest any crop therefrom except under certain emergency conditions. The secretary, in turn, would agree to pay a fair share of the costs of establishing the conservation use and, in addition, make an annual payment to the producer to provide a fair and reasonable annual return for the land diverted to conservation uses, with an over-all limit on the program of \$450,000,000.

In addition, the Agricultural act of 1956 raised support levels on several 1956 feed grains from the previously announced 70% of parity to 76% of parity; froze the 1957 and 1958 national acreage allotments for cotton at no less than the 1956 allotment; froze transitional parity for the basic commodities for 1957; set rice acreage allotments for 1956 at no less than 85% of 1955, and held 1957 and 1958 allotments at the 1956 level; authorized an expanded sec. 32 program, particularly for perishable commodities, with \$500,000,000 to be appropriated annually with limitation of 50% on the amount of such funds which may be used for any one commodity; directed the CCC to sell cotton at prices at which cottons of comparable qualities are offered down to a "comparable minimum of 25.5 cents per lb."

Drought, Flood and Famine.—The U.S. did not escape natural disaster in 1956. Most severe in its results was the continuation and intensification of the drought in the Great Plains: wind and dust damage in some areas was more severe than in the 1930s, spreading even to Iowa, and involving nearly 700 counties and half the farm land west of the Mississippi in one or another of the relief programs initiated by the federal government acting in conjunction with state and local agencies. A Great Plains Conservation program was legislated in July, authorizing \$150,000,-

"CONSERVATION CITY," site of the 1956 national field days and plowing matches near Colfax, Ia. Both major U.S. presidential candidates addressed assemblies at this site during the election campaign

ooo over a 10-year period, mostly to convert marginal crop land to pasture.

Floods in Pennsylvania and some other parts of the northeast, plus delay in seeding and early frost, lessened production and quality in that area. Winter vegetables and citrus fruits were damaged in Florida and other parts of the south in January. A flood insurance program got under way in 1956.

In other countries intense winter frost of nearly a month's duration and gales lashed western Europe early in 1956, resulting in hundreds of deaths, great damage, perhaps \$2,000,000,000 in total, with some crops, especially wheat and olives, hard hit. One result was much increased shipment, from North America, of grains and edible fats and oils.

Drought with food shortages in parts of Andean South America, and in Pakistan, were noted as were reports of famine and floods in Red China. There were some food riots, especially in Poland.

Canada.—Canadian farmers in 1956 reaped abundant harvests in the face of a tightening cost-price squeeze not unlike that confronting U.S. farmers. Though spring sowing of some major crops was delayed and quality of the harvest somewhat lowered by rain and frost, agriculture experienced a highly productive year. The wheat crop was indicated at 535,000,000 bu., higher than the 494,116,000 bu. of 1955, or the previous 10-year average of 463,659,000 bu., but far less than the record 702,000,000 bu. of 1952. Oat production was indicated at 535,000,000 bu. against 403,835,000 bu. in 1955; flaxseed at 34,057,000 bu., as compared with 19,748,000 bu. in the previous year. Rye was down to 8,600,000 bu. from 14,744,000 bu. in 1955. Fruit crops were generally smaller than in 1955, apples (11,600,000 bu.) only three-fifths as productive as in the previous year.

Total Canadian grain stocks on July 1 prior to the new harvest were estimated at 22,959,000 short tons, as compared with 20,708,000 short tons a year earlier and 25,569,000 short tons in 1954. Wheat stocks of 560,000,000 bu. were particularly abundant in relation to annual domestic consumption of about 160,000,000 bu. but only moderately in excess of the 530,000,000 bu.

of July 1955 and below the 615,000,000 bu. carry-over of July 1954. Wheat and wheat flour exports increased to 309,000,000 bu. in the 1955-56 marketing year (August-July), as compared with 252,000,000 bu. the previous year. A Canadian-U.S.S.R. trade agreement, signed in February 1956, called for the U.S.S.R. to take a minimum of 400,000 tons (nearly 15,000,000 bu.) of wheat each year for three years.

The government continued its price-support programs on several of the more important agricultural products. In addition, it initiated short-term farm loans up to \$1,500 on grain stored on farms, stepped up financial payment on some previous wheat crops and introduced government payment of grain storage costs.

Latin America and Southern Hemisphere.—Latin-American agriculture in 1956 made substantial gains. Argentina's agricultural exports were expected to equal in value those of 1955, in spite of a big decline in wheat, normally a major item of surplus. Increases were noted in corn, in meat and in livestock products, including wool. Though about \$25,000,000 worth of fats and oils were purchased from the U.S. earlier in the year, the oilseed harvest provided a significant export surplus, especially of sunflower. Brazil, faced with a mounting coffee surplus, utilized controls effectively; but, in view of a serious cost-of-living situation, took steps to increase production, even by having the army raise its supplies, to control prices and improve the transportation of foodstuffs. Chile, using international experts as advisors, also made a firm attack on the inflation problem by establishing export quotas, increasing the wheat price support by 50%, fixing the price of bread and increasing contributions to family allowance funds. Bolivia, with a severe drought in the highlands, maintained a precarious equilibrium while attempting monetary stabilization, mostly by benefit of food stocks and technical assistance, in total about \$23,000,000, provided by the U.S. A severe drought in Peru also reduced domestically produced food supplies. Middle America benefited from the tight supply-demand situation with respect to mild types of coffee and from firm sugar markets. Mexico increased its exports of agricultural commodities, meanwhile managing to hold the line on imports. It found U.S. efforts to export larger amounts of cotton disturbing, reduced its own cotton plantings, and for a time put retaliatory measures into effect.

The southern hemisphere, especially Australia and New Zealand, protested U.S. export policies as "farm surplus dumping." They, too, had generally favourable production, and wool exports were large, but concern was expressed about their European markets, also about the wheat market in India. Africa in general continued in an era of prosperity and agricultural expansion, except for a few crops such as cocoa. South Africa had accumulated some refractory surpluses in spite of losses from drought, and experienced the now almost universal cost-price squeeze.

Western Europe.—Overall, farmers in this area experienced the most difficult season since 1947. A long and severe winter freeze did great damage, especially to wheat in France, and to citrus, nut and olive production in the western Mediterranean area. Losses, not all agricultural, were estimated as high as \$2,000,000,000. The area continued to be the world's major import area for agricultural products.

The United Kingdom continued to be the world's largest import market for meat and livestock products. Average daily caloric consumption per person continued above 3,100, in spite of the fact that food prices rose more sharply than other consumer prices. The declared intention to cut agricultural subsidies was abandoned. The year's subsidy bill at £215,000,000 was a bit lower than had been anticipated and farming costs were up by £35,000,000 on products covered. Increased subsidies of £25,000,000, rearranged rather drastically among products, followed the trend of increase in number and value of direct subsidies paid to producers.

In the Netherlands, work was started on the first mattress in the Haringvliet, one of the three big inlets to be cut off from the sea, in a 25-year project to reclaim as much as 37,000 ac. at a cost of about 2,000,000,000 guilders.

Finnish farmers engaged in a retaliatory four-day stoppage of food deliveries in March after a general strike was ordered by the Trade Union federation. In May, parliament sanctioned an agricultural price bill in which agricultural income was based on the price and cost level of Feb. 1956.

West Germany's harvest was reported as approximating that of 1955 with fodder and industrial grains increased and bread grains reduced. The cost-price squeeze worsened, resulting in an annual 3% drop in farm workers and rumblings of complaint. The parliament approved a plan to ease farm costs by extending to farmers 1,000,000,000 marks in direct aid and noninterest-bearing credits.

France reported a very short wheat crop and a much expanded barley harvest. An extensive farm strike in May was used to buttress demands for more aid. Spain absorbed rather large amounts of U.S. surplus agricultural products as did Austria. Italy reported a satisfactory year in general and an exceptionally good wheat year.

Middle East and India.—Much of this diverse area experienced comparatively favourable production conditions in 1956 and, as a result, supplied more of its own needs. The wheat crop was a large one in many areas. Turkey reported larger crops of pistachio nuts and almonds as well as a bumper crop of filberts. The wheat crop of 240,000,000 bu. was large, but not quite so large as the record 260,000,000 bu. of 1955. Egypt's cotton crop was as large as that of 1955 and more of it was of superior long-staple lengths; the wheat crop of 56,840,000 bu. was a large one. Syria had a wheat crop of 32,150,000 bu., as compared with only 22,040,000 bu. in 1955; that of Iraq increased to 27,550,000 bu., against 17,390,000 bu. in 1955. Iran had a record large raisin crop and a large rice crop. Pakistan experienced famine and food riots in the late spring, but the wheat harvest was a favourable one of 126,934,000 bu., as compared with 118,420,000 bu. in 1955. A draft of the first five-year plan was released calling for a 13%

"HORN OF OUR DILEMMA," a cartoon of 1956 by Haynie of the *Greensboro Daily News* (N.C.)

increase in production of food grains and large increases in some other crops, and a large expansion by 1,174,000 ac. of land under irrigation by 1960.

India reported over-all improvement by the close of its first five-year effort in June 1956, yet agricultural output for 1956 was estimated at 65,800,000 tons, or about 2,900,000 tons less than in 1954. The plan for the next five years called for an 18% increase in farm production. In August it was announced that the largest agreement ever negotiated for the sale of U.S. agricultural commodities under public law 480 had been reached with India, for a total of \$360,100,000 (cost to the CCC, \$652,300,000), including \$200,000,000 worth of wheat (130,000,000 bu.); \$70,000,000 worth of cotton (500,000 bales); \$26,400,000 worth of rice; \$6,000,000 worth of tobacco and \$3,500,000 worth of dairy products.

Eastern Europe and the U.S.S.R.—The agricultural situation in the Iron Curtain countries continued in 1956 to present several imponderables. Official statements and travellers' accounts were far from agreement as to the facts or their proper interpretation. There was little official assistance to the outside world in its attempts at an understanding. True, the first Soviet statistical handbook since 1939 was published. But with respect to crop production, the new publication restricted itself to a simple table showing percentage increase of grain, cotton and other crops from 1950 to 1955, without revealing the bases on which the percentages were computed.

Late in Dec. 1955 there were official denials of a food crisis, following what appeared to be near failure in the new lands program in 1955 when hoped for rains did not come. Yet western observers were hardly prepared to understand the grain target for 1960 under the sixth plan, which was set at 180,000,000 tons, a figure previously published for 1955. Shortly thereafter, Nikita S. Khrushchev strongly denounced bureaucrats in farming, and there were indications that the virgin lands program would not be expanded beyond the target of 30,000,000 hectares (74,130,000 ac.) to be sown by the end of 1956.

Spring crops were reported as off to a poor start, and in April

Table III.—Index Numbers of Volume of Food Production

Region	(Prewar average=100) Total food production			Per capita food production

Source: United Nations Food and Agriculture Organization, *The State of Food and Agriculture, 1956* (Rome, 1956).

there was a new official appeal to farmers to spur output. By late July, Moscow expected a record harvest, particularly from the virgin lands of Siberia. But by early autumn much of a fine crop was reported yet unharvested and in peril because of weather.

Following the investigations of U.S. corn production in 1955 by an official delegation from the U.S.S.R., substantial amounts of hybrid seed corn were purchased. Intentions to plant 7,000,000 hectares (17,297,000 ac.) to corn in 1956 were indicated, as compared with only 2,000,000 hectares (4,942,000 ac.) in 1954.

A project to increase irrigated cotton acreage by some 647,000 ac. was announced, to be completed by 1962.

It was generally believed that the riots in Poznan, Pol., in June 1956 were in some degree bread riots, following a bitter winter. Yet, U.S. offers of free food were rejected, with the observation that gifts or charity could not be accepted. But Polish authorities said that they would like to purchase grain on the basis of equality with other nations, meaning, possibly, under public law 480 for local currencies. Some grains were purchased on credit from Canada.

Far East.—The situation in the far east during 1956 remained unclear, but spring famine was reported from Red China and North Korea. Nevertheless, later in the year an increase in food rations was reported for some groups in North Korea. August floods damaged thousands of acres of farm crops as far north as Harbin. About 60% of the peasant households in Red China were reported as recent members of the land-pooling agricultural producer collectives, with prospects that this halfway status might be virtually completed during 1956. In April it was announced that China had been a large purchaser of Egyptian cotton.

The agriculture of the Republic of Korea continued to be a bright spot in that economy. That area and Japan continued to absorb quantities of U.S. agricultural surplus, especially cotton, wheat, barley and soybeans; yet Japan found it increasingly difficult to market its cotton textiles in world markets. The crop production was favourable, but not up to the record year 1955.

Philippine production of coconut products increased, with larger movement into the export market. Production of flue-cured tobacco increased to a level more than twofold that of the previous year. Thailand, with a balanced budget and a program of agricultural expansion and diversification, exported 605,000,000 lb. of rice in the first half of 1956 at sharply higher prices. Exports to Japan declined; those to Indonesia were heavy. Indonesia purchased \$91,800,000 worth of U.S. agricultural surplus under public law 480, including 550,000,000 lb. of rice, 206,000 bales of cotton, and some leaf tobacco and wheat flour. The five-year plan was concerned primarily with the production of required food and fibre for its 82,000,000 persons on its many small farms. Burma exported its rice surplus of about 1,900,000 long tons, the largest amount to move in postwar years. Japan was the largest recipient, but about 12% was exported to "iron curtain" countries.

International Organizations.—In March, Philip V. Cardon of the U.S. resigned, because of ill health, as director general of

the 72-nation Food and Agriculture organization (FAO) of the United Nations. Sir Herbert Broadley became acting chief, and B. R. Sen of India was elected to the post in September.

The International Wheat Agreement of 1956, after prolonged discussions, was formulated at the UN Wheat conference in Geneva, Switz., which concluded in April, after which it remained open for signature through May 18 and was signed by plenipotentiaries of 40 governments, including the U.S. and 5 other exporting countries and 34 importing countries.

The International Federation of Agricultural Producers, representing 35,000,000 farm families in 26 countries, announced its ninth general conference would be held at Purdue university, West Lafayette, Ind., in May 1957.

The United Nations Sugar conference, convened in May in New York city and continued at Geneva in October, considered mostly quotas and prices.

Aircraft Manufacture. The year 1956 could be called the year of the turbine transport in the aircraft manufacturing industry of the United States; for, although such planes had been in development for some time, it was during 1956 that orders for three types of pure jet and two types of turboprop transports started pouring in. The five types under development and in production included the Boeing 707, the Douglas DC-8, the Convair 880 Golden Arrow (all jets) and the turboprop Lockheed Electra and Fairchild Friendship, the latter a medium-range plane designed by the Dutch Fokker company and licensed to Fairchild Engine and Airplane corporation for U.S. production.

The three jets and the Electra were all scheduled to start in air line service in 1959; the Friendship was slated for use in late 1957. By the end of 1956, only the Boeing 707, the first jet transport of the United States, and the Friendship had completed first flights.

Meanwhile, however, the demand for piston-engine air liners continued to be strong. A third-quarter report showed that U.S. transport manufacturers still had orders for more than 500 piston-powered air liners, chiefly the Douglas DC-6 and DC-7, the various versions of the Lockheed Constellation and the Convair 440. More than 50 air lines had placed orders for these planes.

In all, including piston and turbine-powered transports, the aircraft manufacturing industry boasted a backlog, as of Oct. 1956, of about \$1,200,000,000, by far the largest nonmilitary backlog the industry had ever seen.

Military production made up the bulk of the industry's business. As the air force approached its authorized strength of 137 wings, the industry was gradually "transitioning" from the build-up rate to the sustaining rate, bringing about a gradual decline in volume. The Aircraft Industries association estimated that military production for 1956 would amount to about 7,800 units, down from 8,400 planes the previous year. In addition, the association estimated that the industry would turn out 4,500 utility aircraft and more than 150 air line transports, an over-all production of about 12,450 aeroplanes. This compared with 13,153 in 1955.

The decline in production was not expected to affect materially the industry's sales position, although a slight drop was anticipated. The Aircraft Industries association estimated that 1956 sales would total slightly more than \$8,000,000,000 compared with \$8,500,000,000 in 1955 and \$8,300,000,000 in 1954. Although a greater decline might have been expected, to match the drop in production figures, two trends changed the balance: the increasing complexity of aircraft with heavily stressed air frames and new electronic equipment pushed the unit price upward; and guided missiles, not reflected in the unit inventory because of security, contributed more and more to sales volume as new missiles were readied for production. There were 7 missiles in operational status and about 20 in various stages of production, late in 1956.

Despite the drop in production units, air frame weight, an industry yardstick, was expected to be higher in 1956 because of a greater emphasis on the massive Boeing B-52 and the increasing weight of fighter aircraft. The Aircraft Industries association estimated that the 1956 air frame weight produced would be closer to 1954's 140,000,000 lb. than to 1955's 124,200,000 lb. (these figures include military and civil aircraft, but not missiles).

The industry's profit margin was expected to remain at its 1954 and 1955 levels, which was slightly less than 4% of sales. The figure would be somewhat lower for the companies engaged in turbine transport manufacture, since they would have to divert some of their profits to tooling and materials for the new planes.

Although employment in the air frame and engine industry had been expected to drop as the military authorized goals were neared, the upsurge in guided missile production and in civil airplane production had raised employment from 764,100 at the end of 1955 to 773,067 by mid-1956; and it was expected to reach 780,000 by the end of the year.

Major aircraft types in production at the end of 1956 included Boeing Airplane company's eight-jet B-52 bomber and KC-135 aerial refuelling tanker (military version of the model 707 jet transport); Convair's F-102A all-weather interceptor and the TF-102A, the trainer version; Douglas Aircraft's B-66B and RB-66B air force jet bombers and the giant C-133A turbine-powered cargo transport built for the U.S. air force; Fairchild Aircraft division's C-123B assault transport (U.S.A.F.); Grumman Aircraft Engineering's F9F and F11F series of navy shipboard jet fighters; the Lockheed F-104 air force interceptor,

fastest plane in the military inventory, and Lockheed's C-130 turboprop transport; the Glenn L. Martin company's P6M Seamaster water-based bomber; North American Aviation's F-100 series of air force interceptors; Chance Vought Aircraft's F8U navy supersonic interceptor; and McDonnell's F-101 air force long-range interceptor.

Principal engine types in production status included Pratt & Whitney's 10,000-lb.-thrust J-57 and 15,000-lb.-thrust J-75; General Electric's J-79, power plant for the Lockheed F-104, rated at 15,000 lb.; Curtiss-Wright's J-65; and the turboprops T-56 and model 501 being built by Allison division of General Motors Corp.

Air Races and Records.

Lieut. Col. Frank K. (Pete) Everest of the United States air force flew a Bell X-2 to a new world speed record of approximately 1,900 m.p.h. late in July 1956. The air force announcement of Aug. 2 told how the swept-wing plane, powered with a Curtiss-Wright rocket engine, had been carried aloft under a B-50 and then released for its test run at Edwards air force base, Calif. The previous mark was 1,650 m.p.h., established by Maj. Charles Yeager on Dec. 12, 1953. The official speed record for planes taking off under their own power is 1,132 m.p.h., made by Peter Twiss of Britain on March 10, 1956. Twiss achieved his feat in a Fairey Delta II. Lockheed F-104s had achieved 1,400 m.p.h., but not in flights under the official international rules that cover speed tests from conventional take-offs.

Early in September, the Bell X-2 soared to about 126,000 ft., or almost 24 mi., for a new altitude mark. The pilot on the record-breaking climb was Capt. I. C. Kincheloe. The former standard of 90,000 ft. was set by Maj. Arthur Murray in a Bell X-1A in 1954. The great performances of this Bell X-2 came to an end on Sept. 27, 1956, when the plane crashed over the Mojave desert, killing its pilot Capt. Milburn G. Apt of Buffalo, Kan.

The Bendix trophy race was among the features of the National Aircraft show at Oklahoma City, Okla., Sept. 1-3. A new mark for the event was set when Capt. Manuel J. Fernandez, Jr., triumphed at an average speed of 666.661 m.p.h. Six planes, all North American F-100C Super Sabre jets, made the 1,120-mi. flight from George air force base in California to the Will Rogers base, where the show was held. Capt. Fernandez was timed in 1 hr. 40 min. 38.8 sec. All six contestants broke the former record of 616.208 m.p.h. that had been set by Capt. E. F. Kenny in the race from Edwards base to Dayton, O., in 1954. Capt. Robert A. Madden was a close second to Fernandez with an average of 656.250 m.p.h.

In the North American race on Sept. 1, four navy pilots from Moffet field, Calif., took part in an FJ-3 Fury jet race from the carrier "Shangri-La," standing in the Pacific off Mexico, to Rogers field. The victor was Lieut.(j.g.) David K. Grosshuesch, who averaged 537.849 m.p.h. The B-47 jet event for the General Electric trophy marked the second day of the show. Flying from Bermuda to Oklahoma City in the elapsed time of 3 hr. 8 min. 43.6 sec., Maj. Joseph Schreiber of the 22nd bomb wing, March air force base, Calif., was the winner. He averaged 601.187 m.p.h.

TEST SECTION of supersonic wind tunnel opened at Lewis Flight Propulsion laboratory, Cleveland, O., in 1956. Designed to test both full-sized and scale models of ramjet, turbojet and other engines for supersonic aircraft and missiles, the tunnel had a Mach number range from 2.0 to 3.5 and could simulate altitudes as high as 160,000 ft. The photo shows a 16-in. ramjet being elevated into position for testing

BELL X-2 ROCKET PLANE which was flown at a world-record speed of about 1,900 m.p.h. in July 1956. During a later trial flight the plane crashed with another pilot, who was killed

A close second was Lieut. Col. John C. Lewis of Barksdale air force base in Louisiana. His speed was 600.058 m.p.h. and his elapsed time was 3 hr. 9 min. 4.9 sec. In the McDonnell F3H Demon race from the "Shangri-La" off San Francisco, Lieut. (j.g.) Ralph Carson of navy fighter squadron 124 of Miramar, Calif., was first. He averaged 566.007 m.p.h. and had an elapsed time of 2 hr. 32 min. 13.45 sec. for the 1,436-mi. flight.

The announcement Sept. 3 of a new national speed record of 1,015.428 m.p.h. marked the closing day of the show. The mark was made by Comdr. Robert W. (Duke) Windsor on Aug. 21 and was the first time the United States record for planes taking off under their own power had surpassed 1,000 m.p.h. Commander Windsor flew the navy's fighter, a Chance Vought F8U (Crusader. As a result of his feat over the Mojave desert near China Lake, Calif., Commander Windsor won the Thompson trophy for 1956.

A Bell H-13 helicopter, aloft since the first day of the show, set a new world helicopter endurance record of 57 hr. 50 min. An H-21 helicopter made the first nonstop transcontinental flight in August, flying 2,610 mi. from San Diego, Calif., to Washington, D.C., in 31 hr. 40 min. The Douglas trophy event, a race for navy planes from the "Shangri-La" off Oregon, was taken by a crew led by Capt. J. Blackburn. The Douglas A3D Skywarrior from the navy squadron at Jacksonville, Fla., triumphed with an average speed of 606.557 m.p.h. The Allison trophy again was won by the Webb air force base ground crew from Big Spring, Tex. The team, headed by Staff Sgt. Eugene F. Bleckler, made an engine change in the record time of 8 min. 18.8 sec. The three-day show attracted more than 191,000 spectators.

Air force Col. Horace A. Hanes, for his record flight of 822.135 m.p.h. of 1955, received the de la Vaulx medal of the International Aeronautic federation and the Mackay trophy. The 11th bombardment wing from Carswell air force base at Fort Worth, Tex., won the Muri S. Fairchild trophy. The prize is a symbol of the air force bombing championship.

Two bombers flew cross-country at an average speed of 670 m.p.h. on Feb. 26, but the time was not confirmed then as a new record. The recognized cross-country mark was set by Lieut. Col. Robert R. Scott of Des Moines, Ia, on March 9, 1955, when three United States air force F84F jets all improved on the then existing standard. Lieut. Col. Scott, first to finish, established the new record with an estimated average of 652 m.p.h. and an elapsed time of 3 hr. 44 min. 53 sec. on the flight from Los Angeles to New York.

Top prize in the tenth annual All-Woman Transcontinental Air race from San Mateo, Calif., to Flint, Mich., was taken by the California sister team of Mrs. Frances Bera, Los Angeles, and Mrs. Edna Bower, Long Beach, her co-pilot. Mrs. Bera thus became the most successful flyer in the history of the Powder Puff derby, having won in 1955 and 1953, and co-piloting the winning plane in 1951. The race standing is computed on a handicap basis. The novice award was won by Mrs. Betty Miller of Santa Monica, Calif., and Mrs. Helen Dodson of Marysville, Calif. Forty-seven of the 49 starting planes completed the 2,366-mi. contest.

The seventh international race for women from Hamilton, Ont., to Varadero Beach, Cuba, was won by Mrs. Marion Schorr Betzler of Columbus, O. The victor, at the controls of a Luscombe 8-E, flew alone in the 1,526-mi. event. Eighteen of 25 starters finished.

Alabama. Alabama, the "heart of Dixie," was a part of the Mississippi territory when it was admitted to the union on Dec. 14, 1819, as the 22nd state. Located in the southeastern part of the United States, it is bounded by Tennessee on the north, Georgia on the east, Florida and the Gulf of Mexico on the south and Mississippi on the west. Known as the "Cotton state" or "Yellow-hammer state" (from the state bird, the yellow-hammer or flicker), Alabama's area includes 51,078 sq.mi. of land and 531 sq.mi. of water. The 1950 census population of Alabama was 3,061,743, of which 1,340,937 was urban and 1,720,806 rural; 2,079,591 white and 982,152 nonwhite. The census bureau's provisional estimate of the population July 1, 1956, was 3,135,000. Montgomery, the state capital, had a population of 106,525 in 1950. Other major Alabama cities and their population (1950 census): Birmingham 326,037, Mobile 129,009, Gadsden 55,725, Tuscaloosa 46,396, Bessemer 28,445, Anniston 31,066, Dothan 21,584, Decatur 19,974, Huntsville 16,437, Phenix City 23,305, Selma 22,840 and Florence 23,879.

History.—The history of Alabama in 1956 was written to the theme of industrial growth and expansion. This was the continuation of a trend which had been building for a decade. In the nine-year period which ended in 1956 Alabama led all southeastern states in the percentage of industrial employment increases, ranked second in the entire south and eighth in the nation. In 1956 new industry came into Alabama at the rate of \$6.708,000 per month for a total of \$61,116,000 through September. Industry already in Alabama expanded at the rate of \$21,903,000 per month for a total of \$197,123,000 through September. This made a grand total for industrial growth of \$258,239,000 for the state through the month of September.

With the support of Gov. James E. Folsom and the legislature, the Alabama state planning and industrial development board pressed forward in its efforts to develop Alabama's inland waterway system. Alabama's state docks in the port of Mobile provided berths for 22 ships and an expansion program was under way to increase this to 25 berths. The board initiated plans for docks on Alabama's rivers: the Tennessee in north Alabama; the Coosa, Alabama, Black Warrior and Tombigbee in central Alabama, all of which converge on the port of Mobile; and the Chattahoochee in the southeastern part of the state.

On Jan. 3, 1956, Governor Folsom called the legislature into special session for the purpose of submitting the question of a constitutional convention to the people of Alabama. One of the prime reasons for the convention was to bring about a reapportionment of Alabama's legislature, which according to the constitution of 1901 was to be done every ten years based on the

PROTESTING ENROLMENT OF A NEGRO, students of the University of Alabama burned desegregation literature in a demonstration at Tuscaloosa, Ala., in Feb. 1956

federal census. This had never been done. The legislature did not call a convention, but on Feb. 3, 1956, an amendment to the constitution was approved which was to be submitted to the voters on Nov. 6, 1956.

Principal state officials during the period Jan. 1955 to Jan. 1959 were: governor, James E. Folsom; lieutenant governor, W. Guy Hardwick; attorney general, John Patterson; state auditor, Mrs. Agnes Baggett; commissioner of agriculture and industries, A. W. Todd; secretary of state, Miss Mary Texas Hurt; state treasurer, John Brandon; state education superintendent, Austin R. Meadows.

Of the votes cast in the 1956 presidential election in Alabama, 56% were Democratic, 39% were Republican and the remainder were Independent. Lister Hill (Dem.), was returned to the U.S. senate unopposed. Alabama congressmen, all Democrats, returned to office were Robert E. Jones, Kenneth Roberts, Albert Rains, Carl Elliott, George Huddleston, Jr., Armistead I. Selden, Jr., Frank W. Boykin, George Grant and George W. Andrews. Other state officials, all Democrats, elected to office were: Davis S. Stakely and James S. Coleman, associate justices of the supreme court; and Aubrey M. Cates, Jr., court of appeals.

Education.—In the 1954-55 school year, Alabama operated a total of 2,781 schools in the public school system (elementary and high schools). There were 1,395 elementary schools, but 2,632 of the schools had some elementary grades. There were 450,840 elementary pupils taught by 13,940 teachers, plus 412 supervising principals. There were 282,552 high school pupils and 10,482 high school teachers, plus 515 supervising principals. State expenditures for education (secondary system, colleges, trade schools, etc.) in the fiscal year ended Sept. 30, 1956, amounted to \$110,800,000.

Social Insurance, Public Welfare and Related Programs.—During the fiscal year ended Sept. 30, 1955, annual expenditures for Alabama's department of pensions and security totalled \$44,930,332.85. Expenditures for public assistance with the average number of persons receiving assistance in parentheses were as follows: old-age assistance \$26,553,344.77 (68,911); aid to the blind \$665,966.95 (1,583); aid to the totally and permanently disabled \$4,161,978.03 (9,736); aid to dependent children \$9,168,080.43 (17,645);

aid to children in foster care \$342,710.54 (915); and temporary aid \$42,940.99 (149).

Alabama in 1955 operated 7 prisons and 31 road camps. The total number of prisoners on Sept. 30, 1956, was 5,336. Total expenditures for the prison system during the fiscal year ended Sept. 30 were \$6,529,088.82. State appropriations for the 1955-56 fiscal year amounted to \$1,295,000.

Public health expenditures for the 12-month period ended June 30, 1956, totalled \$6,586,750. This figure included \$2,904,218 in state funds, \$1,787,792 federal funds and \$1,894,740 local funds.

Maternal and child health services included 2,519 maternity clinic sessions in 47 counties, with 40,953 patients admitted; 501 well-baby clinic sessions in 18 counties, with 9,317 patients admitted; and 1,111 dental clinic sessions in 26 counties with 10,651 patients admitted.

Communication.—All highways and roads in the state, as of Dec. 31, 1955, (federal, state and local combined) totalled 63,085 mi., of which 18,386 mi. were paved and 29,273 mi. were either soil-surfaced or graveled.

State and federal disbursements for highways and roads totalled \$111,261,000 in the 1955-56 fiscal year (estimated). New road and highway construction completed in the 1955-56 fiscal year aggregated 1,600 mi. (approximately). Alabama's railroad mileage during the year was 5,102.5. There were 551,326 telephones in the state. Alabama had 108 airports composed of 43 public fields, 8 private fields, 8 military bases, 18 commercial airports and 31 personal fields. There is heavy barge traffic on the Tennessee river in north Alabama.

Banking and Finance.—As of Sept. 30, 1956, Alabama had 168 state banks with three branches with total deposits of \$429,948,918. Total resources were \$473,739,202. There were 69 national banks with 40 branches with total deposits of \$1,163,320,000 and total resources of \$1,273,787,000. The state also had seven state chartered savings and loan associations with total resources of \$27,994,207; 26 federal chartered savings and loan associations with total resources of \$69,186,774; 112 state chartered credit unions with total resources of \$23,388,520; and 62 federal chartered credit unions with total resources of \$7,845,000.

Total state (government) receipts in the fiscal year ended Sept. 30, 1955, were \$266,483,451.55. Total state expenditures for that period were \$276,808,848.27. The state's gross debt was \$42,528,000 and the net debt was \$37,849,000.

Agriculture.—Alabama's total agricultural production in 1955 was valued at \$550,141,000, an increase of 8.5% over 1954. The cotton crop (lint and seed) grossed \$145,854,000 compared with \$143,327,000 in 1954. Peanuts grossed \$24,021,000 compared with \$12,050,000 in 1954. Cash receipts from marketings to Alabama farmers from crops in 1955 were \$268,585,000 compared with \$208,772,000 in 1954; from livestock and livestock products \$190,980,000 compared with \$182,465,000 in 1954.

Table I.—Production of Leading Crops in Alabama

Crop	Indicated 1956	1955	Average, 1945-54
Cotton, bales	730,000	1,045,000	880,000
Corn, bu.	56,100,000	68,010,000	44,008,000
Peanuts, lb.	203,775,000	213,750,000	258,000,000
Hay, tons	822,000	879,000	671,000
Potatoes, Sweet, bu.	720,000	936,000	995,000
Oats, bu.	5,445,000	4,420,000	3,686,000
Soybeans, bu.	2,090,000	2,162,000	1,128,000
Sorghum grain, bu.	558,000	874,000	445,000
Peaches, bu.	600,000	*	753,000
Pecans, lb.	22,000,000	8,000,000	15,266,000

Manufacturing.—Alabama in 1955 had an estimated 4,700 manufacturing establishments employing approximately 251,000 persons, the payroll profit income of which was \$1,230,000,000. The output value was \$3,255,000,000. Primary metals provided employment for 48,000 people and had a payroll-profit income of \$399,000,000. Textiles employed 50,000 people with a payroll-profit income of \$155,000,000. Lumber employed 34,000 with a payroll-profit income of \$74,000,000. Food products employed 16,000

Table II.—Principal Industries of Alabama

	All em- ployees 1954	Salaries and wages 1954 (in 000s)	Value added by manu- facture 1954 (in 000s)	Value added by manu- facture 1953 (in 000s)
Food and kindred products	16,206	\$ 46,315	\$ 96,545	\$ 75,982
Textile mill products	45,874	109,789	167,183	205,134

people and its payroll-profit income figure was \$64,000,000. The output value of primary metals was \$768,000,000; textiles \$526,000,000; lumber \$224,000,000; food products \$293,000,000. (RH. H.)

Mineral Production.—Table III shows the preliminary data on Alabama minerals for 1954, the latest available, compared with 1953. It includes all minerals valued at \$100,000 or more. In 1954 Alabama was 3rd in output of graphite and crude iron ore, 3rd in output and 4th in consumption of coke, 5th in pig iron production, 6th in lime output, and was 20th in value of its mineral production, with 1.08% of the U.S. total.

Table III.—Mineral Production of Alabama

(In short tons, except as noted)

Mineral	Quantity	Value	Quantity	Value
	1953	1953	1954*	1954*
Total		\$187,087,000		\$151,330,000†
Cement (bbl.)	10,427,000	25,701,000	11,122,000	28,583,000
Clays	1,198,000	1,816,000	1,331,000	2,258,000
Coal	12,532,000	79,370,000	10,283,000	64,030,000
Coke†	6,278,000	72,502,000		
Ferrous†	124,000	20,433,000		
Iron ore	7,446,000	55,640,000	5,913,000	33,327,000
Iron, pig†	4,669,000	217,757,000		
Lime	471,000	5,018,000	422,000	4,488,000
Petroleum (bbl.)	1,694,000	3,290,000	1,584,000	3,690,000
Sand and gravel	3,711,000	3,003,000	3,966,000	3,451,000
Stone	3,957,000	8,154,000	7,394,000	11,609,000
Other minerals	...	5,095,000	...	4,860,000

ENCYCLOPEDIA BRITANNICA FILMS.—*Southeastern States* (1956).

Aland Islands: see FINLAND.

Alaska. Alaska, the northernmost territory of the United States, is separated from Siberian U.S.S.R. by Bering strait. The boundary line follows the international date line between Big Diomed Island, which is soviet soil and in the eastern hemisphere, and Little Diomed Island, which is United States territory and in the western hemisphere. These islands are about three miles apart. Alaska has an area of 586,400 sq.mi. Its population in 1950 was 128,643, including military personnel. The 1954 estimated population was 208,000, including approximately 80,000 military personnel and their dependents. The largest city is Anchorage (1955 est. 40,000) with Fairbanks (12,000) second. Other centres of population are Juneau, Ketchikan, Kodiak, Seward, Sitka, Wrangell, Petersburg, Nome and Palmer. The Aleutian Islands, extending about 1,200 mi. westward from the extremity of the Alaska peninsula, are part of Alaska.

History.—The most significant political event of 1955–56 was the drafting of a constitution for the proposed state of Alaska and the ratification of this draft by the voters. Fifty delegates to the constitutional convention assembled at the University of Alaska at College, near Fairbanks, on Nov. 8, 1955, for a session of 75 days. The constitution, modelled on those of other states, provided for the legislative, executive and judicial departments of government. The legislature would have 60 members, 20 in the senate and 40 in the house. The executive department would have only two elective officials, the governor and the secretary of state. The governor, who could serve not more than two successive terms, would appoint other state officials and department heads, subject to confirmation by the legislature. The judiciary provided by the Alaska constitution would consist of a supreme court of three justices, and a superior court of five judges. Justices and judges would be appointed by the governor but subject to approval or rejection by the voters after three years, and again at intervals thereafter. The constitution set the voting age at 19 years, prohibited state debt except for capital improvements when authorized by law and ratified by a majority of the voters, provided for the initiative, referendum and recall and for local government. The proposed constitution was ratified on April 27, 1956, by a vote of 17,447 to 7,180. The constitutional convention, by ordinance subject to ratification by the voters, provided for the immediate election of two United States senators and a congressman. This proposal was ratified by a vote of 15,011 to 9,556, and the two major political parties nominated candidates for these offices at territorial conventions.

Exploration for oil and gas continued in several areas during 1956 and there was continued interest in forest resources. The U.S. forest service contracted during the year for the sale of 7,500,000,000 bd.ft. of timber for a pulp mill at Juneau and for 5,250,000,000 bd.ft. for a pulp mill at Sitka, both sales from Tongass National forest. Late in the year, neither mill had started

construction. Military construction of the radar Distant Early Warning (DEW) line and other defense installations continued at a high level.

Alaska officials in 1956, appointed by the president, were B. Frank Heintzleman, governor, and Waino E. Hendrickson, secretary. Elected officials were J. Gerald Williams, attorney general; Henry E. Benson, labour commissioner; Hugh J. Wade, treasurer, and Irving M. Reed, highway engineer.

The vote in Alaska's general election, held on Oct. 9, 1956, was heavily Democratic. The new offices provided by the constitutional convention, two senators and a representative, were filled by Democrats, as were a substantial majority of the seats in the Alaska legislature.

Education.—During the 1955–56 school year a total of 36,340 students were enrolled in elementary and secondary schools operated under the direction of the Alaska department of education. Approximately 5,000 were enrolled in grades 1 through 12 in 84 day schools and two boarding schools operated by the Alaska native service, a division of the U.S. bureau of Indian affairs. On-campus registration at the University of Alaska was 556.

Communications.—The Alaska railway, owned by the federal government, extending from Seward and Anchorage on the coast to Fairbanks, had 470 mi. of main track. The White Pass & Yukon railway, operating between Skagway, Alaska, and Whitehorse, Yukon Territory, Can., had 20 mi. of track in Alaska. Alaska had no rail connection with the U.S.

The territory had approximately 1,000 mi. of through roads, 700 mi. of which were paved. There were 1,200 mi. of feeder roads and 1,500 mi. of local roads. The Alaska highway running through Canada connected with highways to the U.S.

Most passenger travel in Alaska and between Alaska and the U.S. was by plane. Nine certificated mail carriers, two certificated nonmail carriers, 10 exempted carriers, and 115 pilot-owners were engaged in air transportation within Alaska or between Alaska and other points during the year 1956.

Radio and telegraphic communication with Alaska and between Alaska and other places was handled by the Alaska Communication system, operated by the signal corps of the U.S. army. There were 14 radio broadcast stations and 6 television stations in operation in Alaska in 1956. Six daily and 14 weekly or semiweekly newspapers and several periodicals were published in the territory.

Banking and Finance.—In the fiscal year ended June 30, 1956, territorial tax collections amounted to \$18,342,874, up from \$14,945,331 the previous fiscal year. At the end of the fiscal year the territory's cash balance was \$7,103,906 and its general fund balance was \$4,069,123.32. Both were down from the previous year's totals. The territory has no bonded indebtedness. On June 30, 1956, 6 national and 12 territorial banks in Alaska had a combined capital of \$3,213,000, surplus of \$3,227,640, deposits of \$155,111,053 and undivided profits of \$2,188,442.

Agriculture.—The territory produced \$2,815,763 worth of agricultural products in 1955, with dairy products accounting for nearly half the total. Cropland in the territory totalled 14,764 ac.

Timber.—A total of 220,000,000 bd.ft. of timber, valued at \$502,000, was cut from Alaska's two national forests during the fiscal year ended June 30, 1956, an increase of 20% over 1955. An additional 22,000,000 bd.ft., valued at \$52,878, was cut from public lands.

Fisheries.—Products of the Alaska fishing industry in 1955 amounted to 186,159,932 lb., with a wholesale value of \$69,722, 887. In 1956 the Alaska salmon fisheries produced approximately 3,000,000 cases of canned salmon, an increase of 700,000 over the poor pack of 1955. (B. F. Hn.)

Mineral Production.—The accompanying table shows the tonnage and value of those mineral commodities produced in Alaska in 1953 and 1954 whose value exceeded \$100,000, with the exception of mercury.

Mineral Production of Alaska

(In short tons, except as noted)

Mineral	Quantity	Value	Quantity	Value
	1953	1953	1954*	1954*
Total		\$24,252,000		\$24,412,000
Chromite	3,000	208,000
Coal	861,000	8,452,000	665,000	6,442,000
Gold (oz.)	254,000	8,882,000	249,000	8,698,000
Mercury (76-lb. flasks)	40	8,000	1,000	277,000

ENCYCLOPEDIA BRITANNICA FILMS.—*Alaska* (1941); *Alaska: Reservoir of Resources* (1955).

Albania. This people's republic in the western part of the Balkan peninsula is bounded north and east by Yugoslavia, south by Greece and west by the Adriatic sea. Area: 11,100 sq.mi. Pop.: (1945 census) 1,112,355; (1955 census) 1,394,310. Language: literary Albanian and two spoken dialects, Gheg north of the Shkumbi river and Tosk in the south. Religion: Moslem 65%, Eastern Orthodox 23%, Roman Catholic 11%. Chief towns (1949 est.): Tirana (cap.) 80,000; Scutari or

Shkoder 30,000; Koritsa or Korce 28,000. First secretary of the Albanian Workers' (Communist) party in 1956 was Enver Hoxha; chairman of the presidium of the people's assembly, Haxhi Leshi; chairman of the council of ministers, Mehmet Shehu.

History.—During 1956 Albania underwent no major change in its Communist regime and the government continued in uneasy control of the country. Even the Soviet denunciation of J. V. Stalin had relatively few repercussions in Tirana, where the Communist party and its policy could be described as "Stalinist." On April 14 the first secretary of the Communist party, Enver Hoxha, wrote an article in the press admitting that the "cult of the individual" had penetrated into the Albanian party, but he made no promises to improve the situation by policy or personnel changes. At the third congress of the party, which opened on May 25, Hoxha again evaded the issues raised at the Soviet party congress. He was firmly against any rehabilitation of purged "Titoists" in Albania and specifically refuted any suggestion of awarding that distinction to Koci Xoxe, who had been executed as a "Titoist" in 1949. At the end of the congress the Albanian Communist leadership emphasized its policy of resisting change by re-electing to the Politburo both the first secretary, Hoxha, and the prime minister, Mehmet Shehu. Government changes announced on June 4 represented a reallocation of duties among existing leaders.

There were, however, some practical changes in industry and agriculture. The prime minister revealed that the first five-year plan which came to an end in 1955 had been too ambitious and that several important projects had had to be abandoned. In agriculture a reversal in policy on collectivization occurred. The government announced that full-scale collectivization of the land was to be resumed. The number of collective farms was to be doubled during 1956, and by 1960 about 70% of arable land instead of the present 27% should be cultivated by collective farms.

In a reference to the contradiction with the previous year's decision to ease the burden of collectivization, the Communist party paper *Zeri i Popullit* explained that many party leaders had "misunderstood" the decision, which did not mean that the setting up of collective farms would cease.

Some progress was made in Albania's relations with Greece. For the first time since 1939 direct contact was temporarily established between the two governments over an Albanian offer to repatriate Greek soldiers who had been held in Albania since their capture during the Greek Communist rebellion of 1947-49. On Aug. 21 a Greek ship sailed for Athens from Durazzo with 217 Greek soldiers on board. The occasion was used by the Albanians for a further appeal for the resumption of diplomatic relations between Albania and Greece. (M. MACK.)

Education.—Schools (1954): primary 2,140, pupils 136,800; higher primary 315, pupils 39,700; secondary 28, pupils 8,600; teachers' training college and five institutions of higher education, all students 1,200.

Finance.—Budget (1954 est.; 1955 est. in parentheses): revenue 10,109,000,000 leks (12,300,000,000 leks); expenditure 9,000,000,000 leks (11,600,000,000 leks), including 3,519,000,000 leks (4,575,000,000 leks) invested in the national economy. Monetary unit: lek with official exchange rate, high and fictitious, of 50 leks to the U.S. \$1.

Foreign Trade.—Estimated imports in 1952: 908,700,000 leks. Main sources of imports: U.S.S.R., Czechoslovakia, Rumania, Poland. Main imports (1952): machinery, textiles, petroleum products, wheat (30,000 tons), maize (20,000 tons), cement (18,000 tons), paper (13,000 tons), window glass (60,000 sq.meters). Main exports: crude oil, pig copper, chrome ore.

Transport and Communications.—Highways (1955) 1,716 mi. Licensed motor vehicles (Dec. 1955): cars 800, commercial 1,700. Railways (1951): 81 mi. linking Duresi (Durazzo) with Tirana and Elbassan via Kavaja-Peqini. Telephones (1954 est.): 1,700. Radio receiving sets (1950): 40,025.

Agriculture.—Grain crop, including about 70% maize: (1934-38 average) 192,000 metric tons; (1955) 318,000 metric tons. Livestock (1938; 1950 est. in parentheses): sheep 1,573,900 (1,707,000); goats 932,000 (830,000); cattle 134,000 (129,000); pigs 15,300 (47,000); horses 54,400 (50,000); asses 44,600 (40,000).

Industry.—Production (1950; 1955 in parentheses): crude oil 132,000 (263,000) metric tons; electricity 21,000,000 (57,000,000) kw.hr.; cement

15,000 (34,000) tons; cotton and woollen textiles 1,100,000 (17,900,000) metres; footwear 272,000 (563,000) pairs.

Alberta. Most westerly of Canada's prairie provinces, Alberta, formerly a part of the Northwest Territories, celebrated its 50th anniversary as a province in 1955. Area: 255,285 sq.mi., of which 6,485 sq.mi. are water. Pop.: June 1, 1955 (official figures), 1,066,000. Largest city: provincial capital, Edmonton, pop. 209,353, metropolitan area, 229,000. Second largest city: Calgary, pop. 168,840, metropolitan area, 180,000.

History.—Agriculture still held a dominant place in Alberta's economy during 1956, but the rapid development of oil and other natural resources in the last few years had made an important contribution to its economy. Increased economic activity was evident in all sectors except the farming community. Mineral production, manufacturing, electric power consumption, construction, retail and wholesale trade and forestry production all exceeded previous post-World War II records, and business conditions were stable. The Mahaffy commission (provincial), formed to investigate charges of maladministration brought against the provincial government during the 1955 election, exonerated all charges. But it was noted that security pledged by members on loans from provincial government banks was inadequate, including such items as hypothecation of future indemnities for parliamentary services, etc.

The Social Credit government (elected June 1955) was comprised of: Ernest Manning, premier, minister of mines and minerals and attorney general; W. W. Cross, minister of health; A. J. Hooke, minister of municipal affairs and provincial secretary; G. E. Taylor, minister of highways, railways and telephones; A. O. Aalborg, minister of education; L. C. Halmrast, minister of agriculture; N. A. Willmore, minister of lands and forests; R. D. Jorgenson, minister of public welfare; E. W. Hinman, provincial treasurer; J. Hartley, minister of public works; F. C. Colborne, minister without portfolio; A. R. Patrick, minister of economic affairs; R. Reiersen, minister of industries and labour.

Education.—Schoolrooms in operation June 30, 1955, totalled 7,368 compared with 6,946 in 1954. Estimated enrolment was 214,000; estimated teachers, 8,191. Estimated school grants (operational) 1955-56, \$25,760,000.

Public Health and Welfare.—Hospitalization expenditures (1954) totalled \$15,335,816. The hospitalization estimate (1955) was \$19,100,000. Public welfare expenditures (1954) amounted to \$8,632,815 to 11,900 recipients.

Transportation and Communication.—In 1955 there were 32,059 mi. of gravelled or surfaced roads and highways in the province compared with 29,861 mi. in 1954. Motor vehicles licensed totalled approximately 354,000 as compared with 338,541 in 1954. Railway traffic reports for 1955 showed that 11,300,000 tons of revenue freight were loaded and 6,100,000 tons unloaded at Alberta stations; exports approximated 5,300,000 tons. Latest telephone statistics (1951) listed approximately 165,000 instruments.

Banking and Finance.—Bank clearings (1954) were \$4,584,000,000. The budget estimate for over-all revenue for the 1956-57 fiscal year was \$208,760,610, an increase over the \$177,400,000 of 1955-56. Total estimated expenditures were \$242,400,000.

Agriculture.—Total farm value of agricultural production in 1955 was \$409,595,000, including wheat \$180,880,000, oats \$60,900,000, barley \$83,000,000, rye \$2,808,000, mixed grains \$16,123,000, root crops \$65,794,000. The value of livestock and livestock products was \$239,296,000.

Fisheries, Fur and Forestry.—Fisheries produced (1955) 8,731,264 lb., valued at \$1,143,499. The number of furs trapped was 1,755,876 valued at \$2,136,851; the fur trade remained in the doldrums with trappers unable to cover expenses because of adverse market conditions. The 136,245 animals pelted on Alberta fur farms (1955 season) were valued at \$2,504,556. Sales of wild animals from fur farms were \$215,850. Forestry production was 430,000,000 f.b.m. compared with 366,000,000 f.b.m. in 1954. The value of lumber and forestry products increased from \$18,236,000 (1954) to \$21,300,000 (1955).

Manufacture and Industry.—During 1955, 1,496 companies were incorporated or registered with authorized capital of about \$139,946,515. The value of manufactured products for 1955 was \$647,500,000 compared with \$570,000,000 (1954). Petrochemical plants accounted for the single largest increase, but all industrial groups showed gains. The index of industrial employment at Oct. 1, 1955, was 10% higher than 1954. Electric power consumption rose from 1,500,875,000 kw.hr. in 1954 to 1,738,868,000 kw.hr. in 1955, a 16% increase.

The value of building construction (1955) was \$309,030,000; that of engineering construction was \$290,289,000, including salaries and wages \$186,066,000 and cost of material \$267,469,000.

Minerals and Mining.—Mineral production for 1955 was worth about

BARBED WIRE in the Casbah section of Algiers. Barricades were erected by French police in 1956 to prevent fugitives from escaping through the narrow streets of the city's Moslem quarter

\$323,740,702, of which the following were major items: coal, 4,344,377 tons, valued at \$23,216,397; natural gas, 126,750,000 m.c.f., valued at \$9,506,250; crude petroleum, 112,200,000 bbl., valued at \$273,094,800. Not included was 29,000 tons of elemental sulphur produced by gas-absorption plants. The gross production of crude oil increased (in quantity) 28% over 1954. (P. H. GL.)

Algeria. A French territory of North Africa. Algeria is situated between Morocco (west) and Tunisia (east), with the status of government general of the French union. Total area: 846,124 sq.mi., administered in two parts: northern Algeria (80,966 sq.mi.), comprising 12 overseas *départements*, and four territories of southern Algeria (765,158 sq.mi.). Pop. (1954 census): 9,528,670, including 9.6% in the southern territories; Moslems (Arabs and Berbers) 8,448,259; French (predominantly Roman Catholic) 934,069; other Europeans 49,979; counted apart (members of armed forces) 96,363. Chief towns (1954 census, urban agglomerations): Algiers (cap.) 355,040; Oran 291,812; Constantine 143,334; Bône 112,010. Governors general (after Feb. 1 known as minister resident in Algeria) in 1956: Jacques Soustelle; Gen. Georges Catroux (Feb. 1); Robert Lacoste (from Feb. 9).

History.—On the settlement of the Tunisian and Moroccan questions, the problem of Algeria became outstanding. On the one hand there was Moslem nationalism, which found its expression in the armed rising of the *fellaghas* and in sporadic assassinations; on the other, the opposition of 950,000 Frenchmen, most of them representing families settled in the country for several generations. The French government's decision not to give up Algeria necessitated the dispatch of large forces (estimated by the end of 1956 at 400,000) and considerable national expenditure. (See also UNITED NATIONS.)

In Jan. 1956 the 61 Moslem deputies began demanding a parley to frame a new constitution for Algeria. Jacques Soustelle, the

governor general, suggested that the whole of Algeria should become an integral part of France, as a number of *départements*. Gen. Georges Catroux was appointed to succeed him, with the rank of minister resident in Algeria in the Guy Mollet government. The European population considered Catroux to be prejudiced in favour of the Moslems and raised a great outcry at Soustelle's departure.

On Feb. 6, during the French premier's visit to Algiers, there were violent demonstrations by the Europeans; a Committee of Public Safety was formed to defend their interests. Catroux resigned, and Robert Lacoste, a Socialist, formerly minister of finance, took his place. Mollet, while declaring that France would stay in Algeria, insisted that Algerian individuality was embraced by the community of Frenchmen and asked the *fellaghas* to lay down their arms with a view to organizing free elections on a basis of universal suffrage.

In March the French national assembly, including the Communists, voted full powers to the government. The dispatch of troops continued; and as their freedom of movement was enhanced by the use of helicopters and parachute forces, their operations against the insurgents became more effective. The rebels then gave up their hope of establishing control over large areas and turned to a strategy of sporadic *coups* (attacks on isolated farms, bomb throwing and assassinations in the towns) or of collective massacres (notably that of April 24, when the victims were the villagers of the Souman valley, who had adhered to the French). (See also FRENCH UNION.) (Hu. DE.)

Education.—Schools (1954-55): primary (French and Moslem) 2,369, pupils 436,577; secondary (French only) 44, pupils 34,468 (1953-54, pupils at higher Moslem schools 631); 1 university, students 5,149.

Foreign Trade.—(1955) Monetary unit: the French metropolitan franc. U.S. \$1 = 350 metropolitan francs. Note circulation: 118,000,000,000 fr. Imports 243,000,000,000 fr., including 199,000,000,000 fr. from France. Exports 161,000,000,000 fr., including 118,000,000,000 fr. to France. Principal exports: wine 62,000,000,000 fr., iron ore 12,000,000,000 fr., citrus fruit 10,000,000,000 fr.

Allergy. Since allergic diseases are mediated by immunologic mechanisms, much of the investigative work during 1956 was done in this particular field. The production and distribution of antibodies was studied by means of labelling them with radioactive isotopes. Similar studies were done to establish the nature of the substance, called antigen, exposure to which produces allergic manifestations. The evidence produced corroborated the original impression that at least in some forms of allergy, the union of antigen and antibody liberates in the tissues a chemical which is like histamine. The allergic manifestations are then produced as a result of the action of this substance on the tissues.

Much interest was evident in the study of connective tissue. This tissue is found widely distributed throughout the body and is found also in the walls of blood vessels. Connective tissue may become involved as a result of the influence of many noxious agents, such as starvation, radiation, stress, cold and allergy, particularly allergy to drugs. Diffuse connective tissue disease and particularly polyarteritis nodosa was shown to be associated with intractable bronchial asthma and allergy to such drugs as sulfonamides, iodine, etc. Considerable evidence, both clinical and experimental, was produced to indicate the immunologic character of this disease.

Attention continued to be devoted in medical literature during the year to the effect of steroids in connection with antibody formation and in the treatment of allergic disorders. Two new synthetic drugs, prednisone and prednisolone, were introduced. They correspond roughly to cortisone and hydrocortisone respectively. These drugs were tried by Leo H. Crip on 96 patients suffering with severe asthma, nasal allergy and skin allergy. The results indicated that these drugs are valuable in the symptomatic treatment of allergic conditions. Since they do not lead to sodium and therefore to water retention as is the case with cortisone and hydrocortisone, they were found to be preferable to the use of the latter products. However, about 10% of the patients did show some side reactions making it necessary in these instances to discontinue their use.

Much evidence was produced to show that atopic dermatitis, sometimes referred to as flexor infantile eczema, is a truly allergic disease and not a condition resulting solely from anxiety and emotional factors. It was believed that inhalants, such as dust and pollen, as well as foods, may be among the causative factors.

Thrombocytopenic purpura and certain forms of anaemia were shown to be caused by allergy to certain drugs. Whenever a patient develops unusual manifestations during the course of treatment for any condition, drugs administered to the patient for the relief of his symptoms may be responsible for these symptoms.

Many more cases of drug allergy were reported. This phase of allergy was assuming increased proportions, especially reactions caused by antibiotics such as penicillin.

Extensive biochemical studies were conducted during the year on the biochemical nature of the delayed reaction in allergic contact dermatitis, such as poison ivy dermatitis.

Two new agencies were organized for the purpose of contributing to the development of new knowledge in allergy. One was the Foundation for the Study of Allergic Diseases and the other was the newly established section on allergy research of the National Institutes of Health.

Switzerland . . .	21.2	29.8	30.2	32.5	28.7	33.1
U.S.S.R. . .	200.7	225.7	275.7	325.7	375.7	450.7
United States . . .	718.6	836.9	937.3	1,252.0	1,460.6	1,565.7
Others . . .	33.0	48.8	56.5	67.3	75.2	112.1
Total . . .	1,640	1,980	2,260	2,720	3,050	3,340

United States.—Based on data supplied by the U.S. bureau of mines. Table II shows the domestic situation. In 1955, the new record output was produced by three companies operating the full year and by a fourth new company in the last six months. Nationwide demand for aluminum was large and in some quarters so insistent that shipments to the government stockpile were diverted to industry. The 400,000 tons scheduled for delivery to the stockpile was cut to 125,000 tons.

Table II.—Data of Aluminum Industry in U.S.
(in 000 short tons)

	1950	1951	1952	1953	1954	1955*
Production, primary . . .	718.6	836.9	937.3	1,252.0	1,460.6	1,565.8
Imports, primary . . .	255.7	161.8	150.7	359.5	228.9	198.0
Exports, primary . . .	23.2	14.8	10.6	15.4	10.8	22.0
Producers' stocks . . .	-12.5	-8.5	-0.9	+39.3	+21.1	+15.0
Available new supply . . .	963.6	992.4	1,073.5	1,556.8	1,657.6	1,726.8
Secondary recovery . . .	243.7	292.6	304.5	368.7	292.0	334.3
From old scrap . . .	76.4	76.6	71.5	78.9	60.0	74.7
Secondary import† . . .	68.4	16.7	5.4	19.8	14.8	40.8
Total supply . . .	1,242.7	1,284.7	1,386.4	1,945.2	1,963.4	1,782.6
Consumption, primary . . .	896.4	973.9	1,072.3	1,556.8	1,696.9	1,748.0

*Preliminary. †Not equivalent of net imports (wt. x 0.9). Imports are largely scrap pig. Some duplication of secondary aluminum occurs because of small quantity of loose scrap imported, which is included as secondary recovery from old scrap.

With world consumption of aluminum increasing steadily, the U.S. bureau of mines, in mid-1956, announced plans to aid industry and government agencies in the fiscal year 1956-57. Plans included frequent revaluation of the aluminum situation of supply and demand and the collection of data on ore supplies and production capacity for aluminum to meet any emergency. The all-time high output of primary aluminum in the first half of 1956 (as facilities under construction were completed and reached their maximum potential) was lowered somewhat by strikes in August which idled about 47% of the nation's primary capacity. Output in the first eight months of 1956 was 1,104,334 tons.

Canada.—Output at the world's largest aluminum plant (Kitimat, B.C.) completed by Alcan at a cost of \$500,000,000 late in 1954, was curtailed in Jan. 1956 by a two-months' delay resulting from loss of power from avalanche-damaged transmission lines. Despite this and loss from drought in Quebec province, at its plants there, Alcan (Canada's sole aluminum producer) had a record output.

(F. E. H.; B. B. M.)

Ambassadors and Envoys. The following is a list of ambassadors and envoys to and from the United States, as of Oct. 1, 1956:

American Citizens Abroad. Estimates received by the U.S. department of state from consular representatives of the United States showed that 566,173 American citizens were residing in various foreign countries as of Jan. 1, 1956. This represented an increase of 49,270 as compared with the census of the previous year. As shown by the table, the increase in the American population abroad was general throughout the world, with the largest gains taking place in the countries of Europe.

Estimate of U.S. Citizens Residing Abroad

	Jan. 1, 1956	Jan. 1, 1955	Increase
South America	42,156	41,301	855
Mexico and Central America	60,816	53,317	7,499
Europe	161,972	139,657	22,315
Asia	55,871	51,398	4,473
Africa	18,623	14,844	3,779
Australia and New Zealand	6,445	5,998	447
West Indies and Bermuda	25,404	24,639	765
Canada and Iceland	159,898	157,367	2,531
Philippines	34,988	28,382	6,606
Totals	566,173	516,903	49,270

The U.S. passport office reported that requests for passport facilities reached a record peak during 1955, when 528,009 passports were issued or renewed. This was an increase of 17% over the 452,049 applications which were processed in 1954. In the first six months of 1956 a total of 352,745 passports were issued or renewed. A study made of the applications received during that period showed New York leading with 82,320, California second with 44,575 and Illinois third with 21,865 applications. Housewives headed the occupational category with 94,170 applications.

The continuing upward trend in foreign travel by American citizens was attributed to larger incomes, longer vacations, speedier transportation and greatly improved travel facilities. These factors were used advantageously by the travel agencies in stimulating interest in foreign travel through the introduction of pay-later plans, attractive package tours, reduced off-season and family rates and other inducements. Foreign countries also encouraged the spending of American tourist dollars abroad by improving tourist accommodations and promoting entertainment and sightseeing attractions. Nearly all countries of western Europe had relaxed their border formalities and American tourists could travel freely in that general area without obtaining visas.

American Library Association. Oldest professional library organization in the world and chief spokesman of libraries in North and South America, the American Library association (A.L.A.) in 1956 had a membership of approximately 20,000, an endowment capital of \$2,600,000, and an income of about \$1,400,000. Executive offices are at 50 East Huron street, Chicago, Ill. During 1956, David H. Clift, executive secretary, and Mrs. Grace T. Stevenson, associate executive secretary, headed a staff of 100 working in Chicago and in the Washington, D.C., office, and were assisted by more than 700 members of voluntary committees and other membership groups.

The midwinter meeting was held in Chicago, Jan. 29-Feb. 4. On June 17-25, Miami Beach, Fla., was host to 2,900 librarians in the first annual conference to be held in the south since 1937. During 1956 the association devoted much of its energy to its own reorganization. The basic purpose of the reorganization, which involved every phase of membership and organizational activity, was to provide for better co-ordination of association activities, partly through the reorganization of existing divisions, boards, round tables and committees, and partly through the creation of new divisions and committees.

In its first year of operation, the Library-Community project, an adult education activity made possible by a grant from the Fund for Adult Education, developed intensive programs in Kansas, Maryland, Michigan and Tennessee. A pilot library in each state studied itself and its community as a base for a long-term program in adult education. Simultaneously, the special adult education concerns of other libraries in these states were

met by workshops, publications and self-study procedures.

An International Relations office was established within the A.L.A. for the period 1956-59 by a grant from the Rockefeller foundation. Intended to encourage United States participation in the development of library services abroad, the specific function of the new office was to determine by means of study and on-the-spot investigation the state of library development and the need for library education in various countries.

A comprehensive new document, *Public Library Service to America, a Guide to Evaluation, With Minimum Standards*, prepared by the Public Libraries division, was presented to and adopted by the A.L.A. council at the Miami Beach conference.

The Library Services bill for extension of rural library facilities was enacted into law in 1956, climaxing a ten-year effort by the A.L.A. for passage of this legislation. At the annual conference, Sen. Lister Hill of Alabama was made an honorary life member by act of council, in recognition of his long-standing leadership in the struggle to secure passage of the Library Services act.

The annual Joseph W. Lippincott award for distinguished service in the profession of librarianship (\$500) was won by Ralph A. Ulveling, director of the Detroit (Mich.) Public library. The Melvil Dewey medal for creative professional achievement was won by Norah Albanell Mac-Coll, reference librarian of the Columbus Memorial library, Pan American union, Washington, D.C., for her translation into Spanish of the 15th edition of the *Dewey Decimal Classification*. Mrs. Otis G. Wilson of Huntington, W.Va., and Judge Eugene A. Burdick of Williston, N.D., received the A.L.A. citations for distinguished service as library trustees. The Margaret Mann citation was awarded to Susan Grey Akers of Chapel Hill, N.C., for outstanding professional achievement in cataloging and classification.

The 35th Newbery medal was given to Jean Lee Latham of St. Petersburg, Fla., for *Carry On, Mr. Bowditch*, judged to be the most distinguished children's book of 1955. The Caldecott medal was awarded to Feodor Rojankovsky of Bronxville, N.Y., for the illustrations in *Frog Went a-Courtin'*.

The E. P. Dutton-John Macrae award for advanced study in the field of library work for children and young people (\$1,000) went to John F. Huebler, assistant librarian, University Elementary school, University of Michigan, Ann Arbor. The Grolier Society award (\$500) was presented to Georgia Sealoff, librarian of the West Seattle (Wash.) High School library for her work with the boys and girls of her community. The University of Kansas library won the *Letter* library award (\$100) for an exhibition and catalogue of banned books. Sister Jane Marie Barbours, C.D.P., director of Our Lady of the Lake Library school, San Antonio, Tex., received the *Letter* librarian award (\$100) for her role in fostering appreciation of books among teen-agers in Texas, as a teacher and as a professional leader. The first Beta Phi Mu award (\$50) to be presented by A.L.A. was won by Margaret I. Rufsvold, director of the division of library science, Indiana university, Bloomington, for her work as author, editor and consultant, particularly in the field of audio-visual materials. Fourteen libraries of all types were winners of John Cotton Dana publicity awards, sponsored by the *Wilson Library Bulletin* and the A.L.A. Public Relations committee for effective public relations programs.

(S. SH.)

American Literature. American literature in 1956 gave only infrequent cause for celebration to discerning readers. No striking new talents emerged, although many younger writers showed competence and incisive analytical power. Older masters such as Ernest Hemingway and William Faulkner published no major new works. American lit-

erature for the year, as contrasted with the flooding output of mass communications industries, was alive and moving forward but at a pace neither rapid nor spectacular.

American problems both domestic and foreign were considered. The situation of the American Negro brought forth a number of studies, including some of durable value. The problems of the presidency and of elections in a democracy, the record of the Franklin D. Roosevelt and Dwight D. Eisenhower administrations and the friction points in foreign relations were covered with varying degrees of scholarly and journalistic competence.

The American business executive, until recent years branded with the mark of Babbitt, had become the object of much sociological investigation and was the hero of one of the year's best-selling novels—Cameron Hawley's *Cash McCall*.

American poetry lived on largely as an academic avocation. Wit, sensitivity and the discipline of traditional form had by 1956 almost totally displaced the obscurantism of a few years before, but no major audience had been reached.

The Foreign Scene.—Continuing world tensions directed many writers toward foreign problems. Richard Wright's *The Color Curtain: A Report on the Bandung Conference* described the hopes, grievances and possible future alliances of the people represented there. Edmund Wilson's *Red, Black, Blond and Olive* perceptively studied four civilizations: Zuni Indian, Haitian, Soviet Russian and Israeli.

Two books on past events with important current overtones were *The Meaning of Yalta*, analyzed by John F. Snell, Forrest C. Pogue, Charles F. Delzell and George F. Lansen; and *Russia Leaves the War*, vol. i, *Soviet-American Relations, 1917-1920*, by former U.S. ambassador to the U.S.S.R. George F. Kennan. Other books on Russian themes were *Soviet Russian Nationalism* by Frederick C. Barghoorn and *The Permanent Purge: Politics in Soviet Totalitarianism* by Zbigniew K. Brzezinski. William O. Douglas' *Russian Journey* revealed particular insight into Soviet Asia and Russian courts and justice.

Oil in all its implications was the theme of two books: Benjamin Shwadrin's *The Middle East, Oil and the Great Powers* dealt with rivalry for production and control; Harvey O'Connor in *The Empire of Oil* criticized the domestic and foreign policies of U.S. companies.

Chester Bowles in *The New Dimensions of Peace and American Politics in a Revolutionary World* urged a new, more flexible foreign policy.

The American Scene.—Executive life in the United States in all its aspects was subjected in 1956 to microscopic examination. C. Wright Mills's *The Power Elite*, a major sociological work, made such an examination as part of his analysis of the structure of power in the United States. More limited in scope but packed with detailed information were *Big Business Leaders in America* by William Lloyd Warner and James C. Abegglen and *The Big Business Executive: The Factors That Made Him, 1900-1950*, by Mabel Newcomer. A quiet, incisive book, *The American Business Creed*, by Francis X. Sutton, Seymour E. Harris, Carl Kaysen

HYPNOSIS PARTY, a form of parlour entertainment which attained some popularity in the U.S. in 1956 after the publication of the best-selling book *The Search for Bridey Murphy* by Morey Bernstein, a Colorado businessman. An amateur hypnotist, Bernstein claimed to have carried a subject back to a former life in Ireland in the early 19th century. In the photograph a girl who has stiffened her body through hypnotist suggestion is able to support the weight of a man without feeling it; note the rigidity in her arm and fingers

and James Tobin critically analyzed the business image of itself and society. The editors of *Fortune* presented in *The Executive Life* accounts of executive activity at home and in the office. And A. C. Spector'sky's artful blend of humour and scholarship in *The Exurbanites* uncovered the folkways of Madison avenue's advertising executives.

Several books prompted by the 1956 elections were noteworthy. These included Robert J. Donovan's *Eisenhower: The Inside Story*, based on minutes of U.S. cabinet meetings and other confidential documents; *Affairs of State: The Eisenhower Years* by Richard Rovere; *A Republican Looks at His Party* by Undersecretary of Labor Arthur Larson; *A Democrat Looks at His Party* by former U.S. Secretary of State Dean Acheson; and *Professional Public Relations and Political Power* in which Stanley Kelley, Jr., demonstrated how advertising experts influence election campaigns. Two analyses of the power of the presidential office were *The Presidency Today* by Edward S. Corwin and Louis W. Koenig and *The American Presidency* by Clinton Rossiter.

More general political ideas appeared in: *The Blessings of Liberty*, Zechariah Chafee's discussion of American freedoms; *Revolt of the Moderates*, in which Samuel Lubell found a shift of U.S. voters from both left and right extremes toward a central political position; *The New American Right*, edited by Daniel Bell, which sought to explain the McCarthyite mentality; Eric Goldman's *The Crucial Decade, America, 1945-1955*, a swiftly paced survey of the last ten years; and *Profiles in Courage*, John F. Kennedy's incidents of political heroism.

Report on Blacklisting, vol. i, *Movies*, and vol. ii, *Radio-Television*, by John Cogley, embodied the results of a two-year study sponsored by the Fund for the Republic. Another fund was scrutinized by Dwight MacDonald in *The Ford Foundation: The Men and the Millions*.

Robert Penn Warren's *Segregation: The Inner Conflict in the South* revealed through direct interviews the divisions and anxieties of the south. *How Far the Promised Land?* demonstrated the optimistic philosophy of the Negro leader Walter White. *Notes of a Native Son*, by James Baldwin, was a Negro writer's sensi-

tive examination of the American scene. *Goodbye to Uncle Tom*, by J. C. Furnas, told of the Negro's effort to break through the fog of myth and prejudice.

Youth: The Years From Ten to Sixteen, by Arnold Gesell, Frances L. Ilg and Louise Bates Ames, completed the massive study of growth patterns of "normal" middle-class children begun by the authors in 1943.

Books on Sigmund Freud marked his centennial year. *Freud: The Man and His Mind, 1856-1956*, by Richard L. Schoenwald, traced the development of Freud's ideas in relation to the period in which he lived. In *Freud and the Crisis of Our Culture*, Lionel Trilling critically examined Freud's theory of the individual's relation to his culture. *Eros and Civilization* by Herbert Marcuse re-examined the Freudian thesis of inevitable conflict between civilization and human instinct.

A number of illuminating biographical sketches and reminiscences appeared. There was Grace Hegger Lewis' *With Love From Gracie: Sinclair Lewis: 1912-1925* with its intimate pictures of Sinclair Lewis in his most creative years; Van Wyck Brooks's poignant *Helen Keller: Sketch for a Portrait*; Julia Smith's *Aaron Copland: His Work and Contribution to American Music*; and John I. H. Baur's *Charles Burchfield*, a critical account with reproductions of the artist's work.

Among books on the natural world were: *The Edge of the Sea* by Rachel Carson; *The Changing Universe*, a presentation of the new field of radioastronomy, by John Pfeiffer; *The World We Live In*, a popular and impressive book by the editors of *Life* and Lincoln Barnett; and four volumes issued by the editors of *Scientific American: Automatic Control, First Book of Animals, New Astronomy* and *Physics and Chemistry of Life*.

Gilbert Seldes weighed the influence of mass communications mediums (particularly television) in *The Public Arts*. Views of two leading architects were put forth in Frank Lloyd Wright's *An American Architecture* (an anthology) and Richard Neutra's *Life and Human Habitat*. A valuable guide to the musical world was provided by B. H. Haggin in *The Listener's Musical Companion*. Selden Rodman in *The Eye of Man: Form and Content in Western Painting* attacked the formalist trend in modern painting. Two books rich in theatrical history were *Form and Idea in Modern Theatre* by John Gassner and *Mrs. Fiske and the American Theatre* by Archie Binns and Olive Kooker. Finally, a bitter and authentic document came from singer Billie Holiday in her autobiographical *Lady Sings the Blues*.

Historical Works.—Marking the 250th anniversary of Benjamin Franklin's birth, Leonard W. Labaree and Whitfield J. Bell, Jr., issued *Mr. Franklin: A Selection From His Personal Letters*. This volume, presenting Franklin in the full richness of his many interests, was a sampling from the monumental 25-volume *The Papers of Benjamin Franklin* on which the editors were engaged. Two other commemorative Franklin books were *The Secret War of Independence* by Helen Augur and *Ben Franklin's Privateers* by William Bell Clark. Both were accounts of Franklin's off-the-record arrangements for French, Dutch and Spanish help against British sea power.

Other significant works dealing with the early United States were vol. xi and xii (covering the period between 1787 and 1788 when Thomas Jefferson was U.S. minister to France) in *The Papers of Thomas Jefferson*, edited by Julian P. Boyd and associates. Samuel Flagg Bemis with *John Quincy Adams and the Union* completed his two-volume biography of the sixth president.

Continued literary attention was focused on the Civil War. *The Living Lincoln*, edited by Paul M. Angle and Earl Schenck Miers, condensed in one volume the eight-volume set of Lincoln's works published three years before. *The Gray Fox: Robert E. Lee and the Civil War*, by Burke Davis, presented the climactic period of Lee's life, the years 1861-65. A shorter book covering

a longer span was *Robert E. Lee* by Earl Schenck Miers.

An attempt, largely successful, to restore Thaddeus Stevens to a high place in history was undertaken by Ralph Korngold in *Thaddeus Stevens: A Being Darkly Wise and Rudely Great*. Ruth Painter Randall managed a sure, intimate portrait of Lincoln family life in *Lincoln's Sons*. In *The Militant South, 1800-1861*, John Hope Franklin gave an original account of the cult and practice of violence in the south. Kenneth Stamp in *The Peculiar Institution* destroyed many myths perpetuated in defense of slavery.

In *Old Bullion Benton, Senator From the New West: Thomas Hart Benton, 1782-1858*, William Nisbit Chambers reappraised a hitherto neglected senatorial giant of the pre-Civil War period. John Higham's *Strangers in the Land: Patterns of American Nativism, 1860-1925*, presented some bitter truths about America's reception of immigrants.

Frank Freidel published the third volume, *Franklin D. Roosevelt: The Triumph*, of his monumental biography. This volume covered the years 1929-32. In *Roosevelt: The Lion and the Fox*, James MacGregor Burns charted the course of Franklin D. Roosevelt's flexible political genius. Richard Hofstadter's *The Age of Reform: From Bryan to F.D.R.* critically re-examined the tradition of American liberalism. Volume ii of the *Memoirs of Harry S. Truman* covered the turbulent years 1946 to 1952. Some of the same events were discussed by Maj. Gen. Courtney Whitney in *MacArthur, His Rendezvous With History*.

Fiction.—Few novels or short stories of 1956 were marked either by the vehemence of social protest or the sweep of literary innovation. Instead, there was a generally high level of technical competence and an increasingly subtle analysis of character.

Most U.S. writers seemed to have made peace or at least a working truce with their own backgrounds. John O'Hara in *Ten North Frederick* and *A Family Party* accepted the milieu of a small Pennsylvania town for his narrative with no suggestion of satire or protest. His compelling concern was not with social environment; it was with the inner drama of his characters which surged behind the façade of manners and status.

Such a bent for analysis marked many works of fiction. Wright Morris in his *Field of Vision* focused on his characters' inner symbolism, ignoring their Main street environment. In *A Season to Beware* William Du Bois probed the life patterns flowing under the flannel suitings of New York's Madison avenue. Irwin Shaw in *Lucy Crown* portrayed, not always credibly, the psychic wounds and long inner dramas following a wife's infidelity. Laura Behler in *Paper Dolls* uncovered the childhood roots of a woman's failure and defeat in life. A group of intellectuals expatriated to Cape Cod were ironically dissected in Mary McCarthy's *A Charmed Life*. Flight to New York brought no salvation for the disconsolate southern poet in Caroline Gordon's *The Malefactors*. Salvation came only after a return to the south and a readjustment facilitated by the Roman Catholic faith.

Some regional coloration was presented in such books as Borden Deal's *Walk Through the Valley*, Hoke Norris' *All the Kingdoms of the Earth*, Ruth Moore's *Speak to the Winds*, Margaret Boylen's *The Marble Orchard* and Grace Metalious' *Peyton Place*.

Two novels dealt effectively with the American political scene: Edwin O'Connor in his *The Last Hurrah* found much good in the career of a big city political boss. Eugene Burdick in a first novel, *The Ninth Wave*, drew a violent picture of California's political life.

Comedy and humour were not strongly represented in the year's fiction. Peter De Vries almost affectionately satirized suburban life in *Comfort Me With Apples*. Mark Harris' (Henry W. Wiggen, pseud.) picture of a baseball team in *Bang the Drum*

Slowly had idiomatic veracity, but its blend of comedy and tragedy was sometimes inept. William Brinkley's *Don't Go Near the Water* enjoyed some popular success.

American fiction in 1956 was not without sounds of dissent and question. John Hersey in *A Single Pebble* balanced an ancient Chinese culture against the values of an American engineer and dam builder. John Howard Griffin in *Nuni* dropped an academic leader into the midst of a primitive Pacific island tribe.

Nelson Algren's picaresque *A Walk on the Wild Side* stated an acid dissent from most of society's established values. Herbert Gold struck a similar note in *The Man Who Was Not With It*. David Karp wrote with strong anger and satire in *All Honorable Men*.

Historical novels, garnished with décolletage, continued to be a major product of the publishing business. At a higher level were Guy Endore's *The King of Paris* (Dumas, père et fils); Pearl Buck's *Imperial Woman* (the last empress of China); Kenneth Roberts' *Boon Island* (shipwreck off the Maine coast); Mary Lee Settle's *O Beulah Land* (American frontier); and Harold Sinclair's *The Horse Soldiers* (Civil War).

Few distinguished collections of short stories were published in 1956. Exceptions were Mavis Gallant with *The Other Paris*, and J. F. Powers with *The Presence of Grace*. James T. Farrell published *French Girls Are Vicious*, and *Other Stories*. *New Short Novels*, 2 presented works by four writers of merit: Norman Mailer's *The Man Who Studied Yoga*; John Phillips' *The Engines of Hygeia*; Dachine Rainer's *A Room at the Inn*; and Wallace Stegner's *Field Guide to the Western Birds*.

Scholarship.—The year 1956 saw major publications of letters, biographies and autobiographies of American writers. Among *The Selected Letters of Henry James*, edited with an introduction by Leon Edel, nearly half had been previously unpublished. *Henry James; Autobiography*, edited by Frederick Dupee, brought together in one volume three separate volumes long out of print. *The Letters of Thomas Wolfe*, edited by Elizabeth Nowell, offered materials for a deeper understanding of Wolfe's vehement career. H. L. Mencken's *Minority Report: [His] Notebooks* presented some of his later work. *The Stature of Theodore Dreiser*, edited by Alfred Kazin and Charles Shapiro, brought together critical and biographical essays on Dreiser. Edward Wagenknecht relied extensively on new documentation for his *Longfellow: A Full-Length Portrait*.

In *The Raven and the Whale*, Perry Miller recreated the New York literary scene and critical controversies before 1850. *The American Adam*, by R. W. B. Lewis, traced the "new man in a bright new world" theme in American writing. Turning to a later period, Walter Rideout in *The Radical Novel in the United States, 1900-1954* successfully related the novel of social protest to main historical currents of the 20th century's first three decades. In *The Cycle of American Literature*, Robert E. Spiller regarded literary history as "symbolic illumination" for social and intellectual history. Alfred Kazin collected penetrating essays on 20th-century literary figures in *The Inmost Leaf*.

Margaret Just Butcher's *The Negro in American Culture*, based on materials collected by Alain Locke, traced the contribution of the Negro to American life. Fresh insight on Africa came from the social scientists whose work was collected in *Africa in the Modern World*, edited by Calvin Stillman. Margaret Mead in *New Lives for Old* told how a primitive people, first visited by outsiders in 1928, had adopted a whole new culture by 1953.

Charles McLean Andrews by Abraham Eisenstadt was a study of that noted historian's work and of the nature of historical writing. *Testament of a Liberal*, by Albert Léon Guérard, was the search for meaningful contemporary liberalism. In *American Paradox: The Conflict of Thought and Action*, Merle Curti analyzed the current distrust of the intellectual. Two books by

Americans on "the great discovery" were biblical scholar Millar Burrows' *Dead Sea Scrolls* and critic Edmund Wilson's *The Scrolls From the Dead Sea*.

Three important reference works were: The first volume, A-B, of *Bibliography of American Literature*, compiled by Jacob Blank; *The Oxford Companion to American Literature*, newly revised by editor James D. Hart; and *The World of Mathematics*, four volumes of selections from leading mathematicians edited by James R. Newman.

Poetry.—The year 1956 brought no flood tide of poetic creation, even though the work of many younger poets was marked by keen insight and technical competence.

William Carlos Williams published his reflective *Journey to Love*. Consisting of poems written during the last two years, it was greeted deservedly as at the level of his best work. Ezra Pound with *Section: Rock-Drill, 85-95 de los cantares* and Witter Bynner with *Book of Lyrics* continued their antipodal poetic careers.

The Complete Poetical Works of Amy Lowell (formerly in 11 volumes) was published with an introduction by Louis Untermeyer.

Playwright Tennessee Williams brought forth a volume of poetry, *In the Winter of Cities*. Richard Wilbur's *Things of This World*, Edwin Rolfe's *Permit Me Refuge* and Paul Engle's sonnet sequence *American Child* were well received. Melville Cane's work was collected in *And Pastures New*.

Distinctive work appeared also from less well-established American poets. This included John Ashbery's *Some Trees*; Helen Bevington's *A Change of Sky, and Other Poems*; Donald Hall's *Exiles and Marriages*; Chester Kallman's *Storm at Castelfranco*; Ernest Kroll's *Pauses of the Eye*; Adrienne Cecile Rich's *The Diamond Cutters, and Other Poems*; George Scarbrough's *Summer So-Called*; and Reed Whittemore's *An American Takes a Walk, and Other Poems*.

Poets of Today, III continued the annual publication of selected new poets. Represented in 1956 were Lee Anderson with *The Floating World*; Spencer Brown with *My Father's Business*; and Joseph Langland with *The Green Town: Poems*. Editor George P. Elliott in *Fifteen Modern American Poets* arbitrarily allotted 20 pages to each poet, with varying results.

Andorra. An autonomous principality between France and Spain, Andorra is bounded north by the *départements* of Ariège and Pyrénées-Orientales and south by the Spanish province of Lerida. Area: 175 sq.mi. Pop. (1954 census): 5,664. Language: Catalan. Religion: Roman Catholic. Capital: Andorra-la-Vella (Catalan) or Andorra-la-Vieja (Spanish); pop. (1954 est.) 600. Coprinces: the president of the French republic and the bishop of Urgel, Sp., respectively represented by their *viguers* (deputies), Jean Menant (France) and Jaime Sansa Nequi (Spain). An elected general council of 24 members appoints one of its members as the *syndic général des vallées* (from 1946, Francisco Cayrat).

History.—Although uneventful politically, the year 1956 was satisfactory economically. During the summer there was a notable increase in the traffic of private cars as well as of motor coaches from Toulouse, Perpignan and Barcelona. More foreign tourists visited the principality than in the best of previous years.

Economy.—No budget or taxes. Telephone system built and maintained by Radio Andorra (1954, about 100 subscribers). Roads maintained by Forces Hydro-électriques d'Andorre S.A. (Fhasa). Cigarette factory with yearly turnover of about 50,000,000 pesetas. Duties collected on imported goods in 1952, about 2,250,000 pesetas. Monetary unit: French franc and Spanish peseta.

Angling. In the fiscal year July 1954 to July 1955, fishing-licence sales continued to climb. A total of 18,854,809 men and women paid a record-breaking \$39,501,838 for all categories of state licences, permits and stamps. Four states—California, Michigan, Minnesota and Wisconsin—again went over the 1,000,000 mark in licence holders.

The 1956 championship tournament of the National Association of Angling and Casting Clubs was held at San Francisco, Calif., Aug. 8–12. The distance trout fly event was won by Jack Crossfield of San Francisco with a long cast of 168 ft. and an average of 162½ ft. The ¾-oz. bait-casting event was taken by Robert Budd, of Jeffersonville, Ind., with a long cast of 369 ft. and an average of 357½ ft. The ¾-oz. bait-casting event was won by W. J. Lovely, of St. Louis, Mo., with a long cast of 386 ft. and an average of 374 ft. The distance salmon fly event was won by Jon Tarantino of San Francisco with a long cast of 207 ft. and an average of 195½ ft. Tarantino also won the Skish distance fly event with a long cast of 159 ft. and an average of 151½ ft.

A team of British anglers from six different parts of the commonwealth won the 13th International Tuna Cup match at Wedgeport, N.S., Sept. 12–14, 1956. Eight teams competed for the Alton B. Sharp cup.

The International Game Fish association announced two all-tackle records. A 120-lb. 8-oz. amber jack was taken on Oct. 25, 1955, at Kona, T.H. by C. W. McAlpin. A 92-lb. black drum fell to J. Aaron on Aug. 27, 1955, at Cambridge, Md. *Field and Stream* magazine announced three new fresh-water records. An 11-lb. 15-oz. smallmouthed bass was taken by David L. Hayes on July 9, 1955, from Dale Hollow lake, Kentucky. A 360-lb. white sturgeon was caught in the Snake river, Idaho, on April 24, 1956, by Willard Cravens. A 14-lb. 14-oz. arctic charr was caught off Baffin Island, N.W.T., by Bartlett A. Taylor on July 9, 1955.

Antarctica. By the close of 1956 only one-half the 5,100,000 sq.mi. of area comprising the antarctic continent had been seen by man since it was first sighted by the New England sealing captain Nathaniel Brown Palmer in 1821. The continental land mass lies almost entirely within the Antarctic circle; it is somewhat circular in outline except for two indentations, the Ross sea and the Weddell sea, where easy ship entry to the coastal shores is possible in summer. Other areas are difficult to ship navigation, particularly during nine to ten months of the year when pack-ice floes, intermingled with glacial and tabular icebergs assisted by low temperatures, are cemented into one solid impenetrable mass. Nine-tenths of the interior area of the continent is snow- and ice-covered, with glaciers flowing seaward and giving birth to icebergs along the shore line. Scattered rock outcrops and mountain ranges up to 14,000 ft. high cross the continent as the continuation of mountain chains originating in South America and New Zealand. The known portion of the continent has an average elevation of 5,000 ft. above sea level. The south pole is located on a smooth, snow-covered plateau about 10,000 ft. high.

History.—Scientific organizations throughout the civilized world agreed to make synoptic geophysical observations between July 1, 1882, and July 1, 1883. This project, known as the International Polar year, was repeated 50 years later, 1932–33. However, the acceleration of scientific achievement and the solar prospectus for 1957–58 impelled the International Council of Scientific Unions to advance the next phase of its program by 25 years. Hence, a period of scientific activities was planned, designated the International Geophysical year, 1957–58, in which 55 nations would participate in a world-wide scientific investigation of the earth's sciences.

Eleven of these nations announced their intentions to set up bases on the antarctic continent and on a few of its offshore islands. Chile, Argentina and Great Britain intended to utilize their established bases on the Palmer peninsula, which had been in continuous occupation since 1944. During the 1955–56 antarctic summer season, the British set up two additional bases at the southeast corner of the Weddell sea on Edith Ronne Land. The International Geophysical year group, using the Norwegian ship "Tottan," set up the Halley bay base and manned it with ten men, while a private British group, under Vivian E. Fuchs and with Sir Edmund Hillary (the conqueror of Mt. Everest), with the "Theron," built the Shackleton base. This base was located about 40 mi. E. of the Argentine General Belgrano base, which was manned by seven men. At Shackleton base, eight men wintered in 1956 and advanced caches of food and gasoline in the interior for use on the planned transantarctic tractor party's journey to McMurdo sound in the Ross sea, via the south pole, during the 1957–58 summer. A support party was being planned to operate from McMurdo sound, to assist the main party in the latter part of the journey.

In Jan. 1956 a French group, under Paul Emile Victor, with the Norwegian sealing ship "Norsel," reoccupied its base with 20 men in the French-claimed sector of Adélie Coast. The group planned to establish a field base about 250 mi. inland toward the south pole as another link in the network of stations during the International Geophysical year program.

In Jan. 1956 the Argentine icebreaker "General San Martin" replaced the wintering personnel at the General Belgrano base, the southernmost station in the Argentine-claimed sector of the antarctic, where the Argentinians prepared to participate in the International Geophysical year program.

On Jan. 6, 1956, the first Russian expedition to the antarctic

in 135 years reached Farr bay on Queen Mary Coast in the flagship "Ob." There the expedition established Mirny base, leaving 32 men to arrange for the Soviet part in the International Geophysical year program. On May 27, 1956, an inland base, Pionerskaya, at an elevation of 9,000 ft., 200 mi. S. of Mirny, was completed and manned by six men. There the coldest temperature in the history of the antarctic was recorded on July 3, 1956, when the temperature fell to -82.3° F. During the return voyage of the Russian ships, scientific personnel conducted extensive oceanographic surveys in the oceans near the continent's shores. The ships stopped in Australia in May before returning to Odessa.

An Australian expedition in the Danish ship "Kista Dan" augmented Australia's facilities in material and personnel at Mawson base on Enderby Land, where 23 men spent the winter in 1956. Geographical discoveries were extended along the Australian-claimed sector, and an additional field station was built about 300 mi. in the interior. A new mountain range was discovered which links this area with earlier discovered features.

The United States government's logistic support in the 1955-56 season was of major proportions in the furtherance of the third International Geophysical year. It was sponsored by the department of defense and the National Science foundation and National Research council. Navy task force 43 launched Operation "Deepfreeze I" to provide logistic support for the antarctic phase of the International Geophysical year program. This consisted of nine ships which departed from New Zealand in mid-December 1955, and proceeded to set up two bases in the New Zealand-claimed Ross sea sector. At Kainan bay, in the eastern part of the Ross ice shelf, Little America V was built as the focal point for all United States activities. Seventy-three men were left to winter there. An air operations base was built at Hut Point in McMurdo sound, where the English explorers Scott and Shackleton had their wintering bases when attempting to reach the south pole in the early 1900s and where 93 Americans were left to winter during the 1956 season. Two navy Skymasters and two Neptunes flew on Dec. 20, 1955, from New Zealand and landed on the sea ice at McMurdo sound. From there they made a number of reconnaissance flights until Jan. 17, 1956, when, because of sea ice conditions, they were forced to return to New Zealand. On a 3,000-mi. round-trip flight to the Weddell sea, a Neptune plane sighted a new mountain range at about 80° S., 50° W., reaffirming observations by Finn Ronne in 1947 that the continent is not divided by a frozen body of water between the Ross and Weddell seas.

The air facility base at McMurdo sound was a key project in the U.S. navy's effort to set up a base at the south pole by aircraft during the months of Nov.-Dec. 1956. Large C-124 Globemaster cargo planes were flown in from New Zealand. Based at McMurdo, they would air-drop equipment at the pole station, where 15 men would winter until Jan. 1959. Similarly, the Byrd base at 80° S., 120° W. was to be established by tractor trains and aircraft during Nov. 1956, and 23 men would occupy this base.

By the first part of March 1956 all ships of the task force had left the antarctic except for the icebreaker "Glacier," which skirted the continent's shores and surveyed Knox Coast where another International Geophysical year station was to be set up in Dec. 1956. Heavy ice prevented the "Glacier" from visiting the Mirny base on Queen Mary Coast. However, a landing was made at Princess Astrid Coast, where a Japanese expedition, under E. E. Nishibori, using the diesel ship "Soya," planned to build an International Geophysical year station manned by ten men in Jan. 1957. Because of the lateness of the season and heavy ice pressures, the "Glacier" was unable to enter the Weddell sea to locate a base site for a fifth United States station,

U.S. NAVY ICEBREAKER unloading cargo at McMurdo sound, Antarctica, Feb. 6, 1956. The cargo was to be stockpiled for use by the U.S. scientists coming to Antarctica for study during the International Geophysical year, 1957-58

to be built in Dec. 1956. Task force 43 was headed by Rear Adm. George Dufek, who also supervised field activities of "Deepfreeze I." Rear Adm. Richard E. Byrd was appointed senior U.S. representative by the department of defense, "charged with maintaining effective monitorship over those political, scientific, legislative, and operational activities which comprise the total United States Antarctic program."

Operation "Deepfreeze II," again under Admiral Dufek, was launched on Sept. 18, 1956, when the "Glacier" again departed from Boston for the antarctic. In New Zealand she was joined by other naval vessels, and by Oct. 17 the ships were in position in the open stretch of ocean between New Zealand and the antarctic continent to safeguard and guide the U.S. air force and navy planes carrying men, supplies and equipment from Christchurch, N.Z., to McMurdo sound. These flights began on Oct. 16, 1956. From McMurdo sound, supplies were to be flown to other bases.

The first landing at the south pole itself was made on Oct. 31, 1956, in a C-47 aeroplane. The party of seven, under Admiral Dufek, remained on the surface for 45 minutes. Because of the high altitude, ten JATO's were necessary to get the plane in the air once again, while the larger Skymaster (four-engine plane) hovered overhead ready to drop emergency equipment should the C-47 be unable to lift off the surface. The temperature on the surface was -58° F. Instead of commencing the air drop of equipment for the pole station immediately, this was postponed till mid-November when higher temperatures were expected. Soon after the polar landing, the biggest air operation in antarctic history commenced. C-124 cargo planes began air-lifting and parachuting 500 tons of equipment for construction of the south pole base. Smaller planes, capable of landing at the 10,000-ft. elevation, brought in construction crews and the more sensitive instruments. The scientists were to be flown to the south pole about Feb. 1, 1957, at which time the construction crews would be returned to McMurdo sound.

The Knox Coast task group, with three ships, under Capt. C. W. Thomas, U.S. coast guard, got under way in early Nov. 1956, with stops at New Zealand, to set up the Knox Coast and Cape Adare stations. The Weddell sea task group, with two ships under Capt. Edwin A. McDonald, U.S. navy, left Punta Arenas, Chile, during the first part of Dec. 1956, to penetrate the Weddell sea pack ice and reach the Bowman peninsula in Edith Ronne Land, where the sixth U.S. International Geophysical year base was to be established and manned until March 1959 by 41 men

under the command of Capt. Finn Ronne, U.S. navy.

The sealing ship "Polarcircle" left Oslo, Nor., in the first week of November for Queen Maud Land where, 25 mi. inland, another International Geophysical year station was to be set up. It was to be manned by 14 men under S. Helle of the Norwegian Polar institute. The British International Geophysical year party and the Fuchs-Hillary group left England on Oct. 10, 1956, in the Danish ship "Magga Dan" with scientists for the Halley bay base and the leaders of the transantarctic tractor party for the Shackleton base. Similarly, the French, the Chileans, the Argentinians and the Australians prepared to resupply their bases with new personnel during the 1956-57 antarctic season. The Soviet expedition ships "Ob," "Cooperationsiys" and "Lena" left Kalinin-grad (Königsberg) in mid-Nov. 1956 for their Mirny base on Queen Mary Coast with replacement of personnel.

(See also GEOGRAPHY; INTERNATIONAL GEOPHYSICAL YEAR, 1957-58.) (F. RE.)

Anthropology. The year 1956 did not show the same type of integration in the field of anthropology which had been manifest previously. The discipline seemed obliged to draw in on itself, to regroup its forces and to explore new avenues of research before attempting to find anew a pattern of common interest. As a result, a summary of the year appeared more as a diverse chronicle of events than a picture of the expanding and vital field of research that anthropology is.

The pattern of diversity became evident in the two major international congresses which were held in the late summer. The 32nd International Congress of Americanists, Copenhagen, Den., Aug. 8-14, lacked a central organizing theme. Although all papers had remote connections with the Americas, there were significant contributions from the Soviet Union on Siberian archaeology and museum reports from various European countries. A session was devoted to glottochronology which established a marked division of opinion between the American and European scholars, the former supporting this new dating technique, the latter finding that it did not concur with their recorded data. Both the Eskimo and the phoneme merited additional study, and the congress re-emphasized this, but did not clarify the direction of research.

The fifth International Congress of Anthropological and Ethnological Sciences, Philadelphia, Pa., Sept. 1-9, continued the pattern of diversity. More than 600 delegates and individuals attended, representing more than 50 countries. For the first time a delegation from the U.S.S.R. was present. Steps were initiated toward intellectual interchange between the Soviet area and the west, and valuable information on Soviet anthropology was presented for the first time.

The most important event at the congress was the formal establishment of the International Union of Anthropological and Ethnological Sciences. Founded on a tentative basis at Brussels, Belg., in 1948, it was both the offspring and the parent of the congress, meeting concurrently with the congress, growing out of it and acting as one of the sponsors. The aim of the union is to maintain permanent relations among anthropologists and ethnologists of all countries, to stimulate international co-operation and to maintain contact with scientific organizations in anthropology and related fields. As constituted, the union was composed of 58 organizations from 24 countries and was governed by an executive committee elected by the general assembly. The union had already established relations with the International Council of Philosophy and Humanistic Studies and was represented in the International Council of Social Sciences.

The American Association of Physical Anthropologists, in its 25th annual meeting April 6-8 in Chicago, Ill., reopened the discussion on the Australopithecinae which had taken place at the

third Pan-African Congress on Prehistory. Participants from England, South Africa and the United States joined in the symposium. The experts tended to place the Australopithecinae on the main lines of human evolution chiefly because of bipedal locomotion and hominid teeth. However, a study made by Lois W. Mednick (*American Journal of Physical Anthropology*, 13:203, June 1955) and endorsed by other scientists reached the conclusion that the australopithecine pelvis showed a condition transitional to erect posture and that the little animals were probably only partially bipedal. In this connection, Cesare Emiliani revised the length of the Pleistocene, based on radiocarbon reports by M. Rubin and H. E. Seuss and ionium dates by Urry. With this scientific information, Emiliani postulated a maximum date of 270,000 years for the beginning of the first Pleistocene glaciation, which made possible rapid evolution of the hominids from the Australopithecinae to *Homo sapiens*, and great ability to speciate (*Science*, 123:924-926). Although this evidence was illuminating, the possibility that the Australopithecinae are a side shoot of human evolution was reinforced by a report of Henri Vallouis (*American Journal of Physical Anthropology*, 14:319-323) on the Montmaurin mandible from Haut-Garonne, Fr. Dated either in the second or third interglacial, this jaw shows traits intermediate between the well-known Mauer jaw and the Neanderthal jaw. With the removal of the Piltdown fake from the scene, it is now possible to postulate an evolutionary sequence of large hominid forms from Mauer to Montmaurin to Progressive Neanderthal to *Homo sapiens*, extending from the second glacial period of the Pleistocene to the last glacial period, eliminating diminutive forms from the sequence.

Two other primate forms engaged attention during 1956. The "Abominable Snowman" of the Himalayas returned to scientific notice as the result of a sighting by Slavomir Rawicz (reported in his *The Long Walk*, 1956) and a report by Swami Pranavanda (*Indian Geographical Journal*, 30:99). Conservative scientists tended to the opinion that this animal was a Himalayan red bear, but the alternate opinion was voiced that it was a giant form of orangutan, similar to *Gorilla beringii*. The second primate was called the "Abominable Coalman" by one expert. It was an old find, discovered originally in 1869 by Paul Gervais in lignite mines in the Bamboli mountains of Italy. Identified originally as a monkey, little attention was devoted to the specimens until they were re-examined in 1956 by J. Hurzeler, who brought them to New York city under the auspices of the Wenner-Gren Foundation for Anthropological Research. The specimens represent approximately 12 individuals and were originally called *Oreopithecus*. There seemed to be little argument about their date, which was late Miocene or early Pliocene. Examination of the teeth and the configuration of the jaw fragments revealed that this form had definite hominid suggestions; the canine teeth were reduced, the alveolar profile was orthognathous and the molar structure strongly suggested hominid affinities. Experts were divided, but a minority felt strongly that this primate form stood on the stem of human evolution and was more hominid than simian. The Wenner-Gren foundation was assisting additional excavation in the hope that more cranial fragments and all-important pelvis would be discovered. If the minority contention was supported by additional material, the separation of the primates from the hominids would have to be pushed far back into geological time. In this connection, G. F. Debets reported at the International Congress of Anthropological and Ethnological Sciences a find of late Miocene or Pliocene molar teeth from Georgia, U.S.S.R., which had both pongid and hominid traits. The form was named *Udabnopithecus*. These new discoveries and analyses suggested that the pattern of primate evolution had to have a thorough re-evaluation.

New items on the dating of early finds were contributed by

the radiocarbon technique. At the site of Lewisville, Denton county, Tex., a camp site of more than 14 hearths associated with extinct mammal forms was found. The cultural identification of Llano (Clovis) in such association was not unusual, but the age of 37,000 years produced by the laboratory of the Humble Oil company was unusual (*Science*, 124:396). G. F. Carter reported the discovery of a deposit of mammoth bones associated with fire traces on Santa Rosa Island, California. Radiocarbon dating gave this find an age of 29,000 years (*Science*, 123:259). While radiocarbon stretched the period of occupation of the Americas by man, it seemed to be lowering the dates of the period of occupation of Europe. Rubin and Seuss, reporting radiocarbon dates determined by the U.S. geological survey (*Science*, 123:442), brought the age of the late Magdalenian period of northern Europe to 8,800 years, and the Hamburgian Palaeolithic period to 11,750 years.

Robert Redfield (The University of Chicago) delivered the Huxley memorial lecture at the Royal Anthropological institute in London, Eng., and received the institute's medal.

The annual highest anthropological honours for the year, the Viking fund medals and awards, presented by the Wenner-Gren foundation, went to A. I. Hallowell (University of Pennsylvania), general anthropology; W. E. LeGros Clark (Cambridge university), physical anthropology; and J. E. S. Thompson (Carnegie institution), archaeology.

Archaeology. **Eastern Hemisphere.**—The archaeological year 1956 was not marked by any highly spectacular find. A symbolic event of considerable importance took place in Athens, Gr., where the 75th anniversary of the founding of the American School of Classical Studies at Athens was celebrated together with the completion of the school's 25 years of excavation in the Athenian agora. On Sept. 3, 1956, King Paul of Greece dedicated the newly completed restoration of the stoa of Attalos II as a museum for the antiquities recovered in the agora.

The year had somewhat unusual archaeological events. The British consul at Syracuse, Sicily, with the aid of diving units of the Italian navy, began the recovery of artifacts from the Athenian fleet which was destroyed in Syracuse harbour in 415-413 B.C. Bernard V. Bothmer of the Boston Museum of Fine Arts, Boston, Mass., with the aid of casts, discovered that the head of a statue of the Egyptian pharaoh Osorkon II in a U.S. museum fitted a body in the Cairo museum. The Norwegian Thor Heyerdahl further convinced himself of links between the makers of the sculpture of Easter Island and the South American Indians. Some other authorities remained sceptical.

Work in the field of philology—the reading and interpretation of ancient written documents—was fruitful. The caves near

Khirbet Qumran in Jordan continued to yield the materials referred to as the Dead sea scrolls. The site of the Essene monastery at Khirbet Qumran itself was being excavated, and a team of British and United States scholars was at work on the scroll fragments in the Palestine Archaeological museum in Jordanian Jerusalem. Few scholars seemed to concur in the implications of John Allegro of the Victoria University of Manchester, Eng., that the crucified Essene "teacher of righteousness" might have been a pattern for Jesus Christ. The cutting open and piecing together of bronze scrolls from cave number three was successful, and revealed a text which spoke of the distribution of several tons of precious metals, buried in about 60 places throughout Palestine.

Further philological work on the newly (1954) deciphered Minoan Linear B texts of Crete and Greece suggested that men named Achilles, Hector, Deucalion and Orestes held land on Crete about 1200 B.C. In Italy, several new Etruscan sites were located with the aid of aerial photography. Renato Bartoccini of Rome, beginning excavations at Vulci (which is known to have been a bilingual city), hoped to recover an Etruscan "Rosetta stone."

Pleistocene Prehistory.—There was unofficial word from the Makapansgat area of South Africa that responsible prehistorians had recovered coarse (but recognizable) stone tools from the strata which yield the bones of the *Australopithecus* man-apes. Previously, claims of tools with the australopithecine fossils had not been generally accepted. The new finds, if truly acceptable, would have considerable bearing on the interpretation of the fossils and on the earliest appearance of a tool-using being.

Alfred Rust reported the recovery of very early stone tools in a gravel pit near Meiningen in east Germany. Convincing stone tools of very early type were also excavated on Hokkaido, Jap., by Johannes Maringer; these included crude pebble tools and also "bifaces" of the Patjitanian type already known from Java.

A few miles northwest of Rome, at Torre in Pietra, A. C. Blanc encountered early types of stone hand axes, in association with an extinct fauna. Blanc was reported to suspect an age equivalent to that of the Java and Peking man finds (middle Pleistocene). Another group of early hand axes was discovered in a fossil spring at Azraq, east of Amman in Jordan.

The usual rather large number of excavations in the cave deposits of Upper Pleistocene times in western and central Europe proceeded. An apparently unresolved controversy surrounded the newly discovered cave paintings at the Rouffignac site near Perigueux, Fr. There, the claims of highly respected French archaeologists that the drawings of prehistoric animals pertain to the Upper Palaeolithic were disputed by speleologists who claimed to have seen no paintings in the cave when they investigated it ten years before.

Ancient Near East.—In Egypt, the clearance of various architectural and epigraphic monuments at Luxor, Karnak, Thebes and Abydos, by both Egyptian and foreign excavators, proceeded. The sarcophagus of a daughter of the 12th-dynasty king Amenemhet III was opened, but contained little save a necklace. The remarkable find of the year was that made by W. B. Emery in the 1st-dynasty cemetery at Sakkara. This was the mastaba tomb of Queen Her-Neit. Incorporated within the normal 1st-dynasty mastaba structure was a low pyramidal brick-covered mound of earth which covered the rock-cut burial shaft itself. Emery suspected that the germ of the idea of the later pyramids might already be present in the low pyramidal brick-covered mound.

Well to the west of Egypt, near the Algerian border with Libya, Henri Lhote discovered a great number of rock drawings, which he believed show evidence of a migration of herdsmen from upper

Egypt. Egyptian-type river boats figure in some of the drawings.

There was considerable archaeological activity on both the Israeli and Jordanian sides of Palestine. Jean Perrot cleared a well-prepared grave, believed to pertain to the Natufian assemblage, near Hazor in upper Galilee. So far, Natufian materials had been identified only in caves.

At Jericho in Jordan, Kathleen Kenyon continued her concentration on the early prepottery levels of the town. She subdivided this manifestation into an earlier "hog-backed brick" and a later "plastered floor" phase. The scale of architectural elaboration, in basal levels as early as Miss Kenyon believed those of Jericho to be, was quite staggering on theoretical grounds. Further early Bronze Age fortification walls and a fine middle Bronze Age tomb were encountered.

The major Israeli effort, under Yigal Yadin, was large-scale clearance at the mound of Hazor. More or less continuous occupation from Hellenistic times back to c. 1400 B.C. was already indicated. A Canaanite shrine with small stelae and a seated figure of a god were encountered.

The Israeli department of antiquities also undertook a survey of the Maccabaeon fortress palace of Masada, where a thousand zealots held off the Roman army for three years. A catacomb of the time of the Roman occupation was cleared at Beth Shearim. Several U.S. scholars did intensive survey in the arid Negev zone, which yielded evidence of how—through dams and channelled catchment basins—the area was once so agriculturally productive.

Two new U.S. expeditions began work in Jordan, one under G. E. Wright at Shechem and the second at Gibeon under J. B. Pritchard. Pritchard began his work on the area of the reservoir and water canal of the site of Gibeon.

In Syria the long-standing work of Claude Schaeffer at Ras Shamra and of André Parrot at Mari were continued. Parrot increased his exposures in the pre-Sargonid levels of his Sumero-Akkadian outpost city on the middle Euphrates. The Syrian directorate of antiquities reported the location of the port town of Semira, often mentioned in the international correspondence of the later second millennium B.C.

In Iraq there was great anticipation concerning the possible appearance of a new royal tomb at Warka (biblical Erech), long under excavation by Heinrich Lenzen for the German Archaeological institute. So far, Lenzen had exposed only the entrances to a walled-up structure of the early dynastic period. Naji al-Asil, director general of antiquities in Iraq, believed the recovery of a royal tomb of the Ur type, but considerably earlier, was "virtually certain."

The important direct yield in Iraq for the year was that of Richard E. Haines's joint Oriental institute-American Schools of Oriental Research expedition at the ancient Mesopotamian holy city of Nippur. There architectural clearance in the sacred area, of the temple of the goddess Inanna and of the ziggurat-Enlil temple compound, traced some of these buildings back to their early dynastic aspect. A number of intact foundation deposits, with bronze figures of the kings Shulgi and Urnammu, were found.

The work of the British School of Archaeology in Iraq, under M. E. L. Mallowan, continued at the ancient Assyrian capital at Nimrud. The exposure of monumental architecture was considerably increased, and important additions were made to the magnificent series of ivory carvings.

The directorate general of antiquities in Iraq was mainly concerned with survey in connection with a salvage archaeology program made necessary by the new public works projects being developed as the result of the intelligent use of oil royalties.

In Iran the University museum of the University of Pennsylvania, Philadelphia, under the directorship of Robert Dyson, undertook a long-range excavation program at the site of Hasanlu,

southwest of Lake Urmia. This important area was almost unknown archaeologically. Trial trenches indicated Sassanid and Parthian upper layers, and painted pottery horizons beginning at about three metres' depth.

In Turkey the major national German, British and U.S. field programs proceeded. At Gordion, the Pennsylvania University museum concentrated mainly on the Phrygian levels of the town, and the main gateway was discovered.

Greece and Rome.—Before the Cyprus troubles began, Saul Weinberg was able to complete his first successful season of the new University of Missouri expedition at Episkopi. As the Cyprus troubles developed, however, their political implications in Greece began to be felt. The British work at Mycenae was postponed, for example. Carl Blegen's University of Cincinnati work at Nestor's Pylos proceeded, however, with most of the palace area itself now cleared. Oscar Broneer, of The University of Chicago, continued work at the temple of Poseidon at Isthmia. The French school continued its work at Argos on a large scale, and the German institute resumed the clearance of the Leonidaion at Olympia. The Greek service was active on the south slope of the Athenian Acropolis, where a new road was being constructed. Late Roman buildings, an apparently Classical and unexpected gate in the city wall and geometric graves were encountered. An early Christian church of some size, possibly that of St. Leonidas, was accidentally discovered by a plowman near Corinth.

A large, unidentified Hellenistic Greek city was under excavation by Erik Sjoqvist for Princeton university at Serra Orlando in Sicily. The agora was unusual, in having been built around a bowl-shaped amphitheatre. Another Hellenistic city, Tolmeta, in Libya, was the scene of continuing excavations by Carl Kraeling of the Oriental institute of The University of Chicago. There a city block, which included a large house, was cleared.

In Italy the event of the year was the discovery, by the Pontifical Commission of Sacred Archaeology, of a new Roman catacomb, small in size but remarkable for the number and beauty of its frescoed paintings. It was probably 4th century A.D. in date. The frescoes depicted a wide variety of Old and New Testament scenes, and experts inferred that one scene was that of an anatomy lesson.

In the Roman provinces, the remains of a large villa-farm, with excellent mosaics, were cleared at Torre de Palma in Portugal. In London, Eng., further excavations in the Walbrook site yielded a large and excellently preserved assortment of Roman tools, hardware, surgical and cosmetic implements and jewelry. Near Cripplegate church, in another portion of the bombed area of the London City, a part of a Roman fort was cleared.

The Byzantine institute uncovered and preserved a magnificent series of frescoes and mosaics in the mosque of Ka'riye in Istanbul. The art was called the best preserved of any of the Palaeologan dynasty.

Europe.—Stuart Piggott of Edinburgh, Scot., continued his exacting excavations at Stonehenge, in Britain. The materials of a fine Celtic grave, at Reinheim, in the Saarland—found accidentally in 1954—showed oriental (e.g., Phoenician or Etruscan?) influence in the decoration of rich gold jewelry. The grave probably dates to the 5th or 4th century B.C. Another rich grave, of a Frankish prince of about A.D. 600, was encountered during open-pit coal mining west of Cologne, Ger. This grave included a magnificent gilt bronze helmet, probably of north Italian workmanship. At Lindholm, in Jutland, the ship-shaped graves of Denmark's largest viking cemetery were investigated.

Asia.—H. D. Sankalia and his associates of Deccan college, Poona, India, were archaeologically active. Excavations on a mound near Nevasa, Ahmednagar district, Bombay state, yielded

Above: H. Wright Baker of Manchester university, England, preparing to cut one of the copper Dead sea scrolls discovered in 1952. Archaeologists and linguists began to publish translations of the contents in 1956

Above: Boy climbing stairs from the pool of Gibeon, an ancient city of Palestine where Joab killed Amasa (2 Sam. xx). The site, near El-Jib, was excavated in 1956 by U.S. archaeologists

Below: 4th-century fresco from a catacomb discovered in a suburb of Rome, It., in 1956. The fresco, showing an ancient anatomy class, was one of about fifty, all well-preserved

Below: U.S. archaeologists of the River Basin surveys of the Smithsonian institution excavating bison bones and stone artifacts at an early Indian camp site on the Marias river, Montana

Below: Workmen clearing away rubble from a group of buildings discovered on the Appian way near Minturno, It. The site was believed to have been either a Roman shopping area, a forum or a resort village

five phases of occupation. The earliest phase included chipped stone and microlithic scale tools, polished stone axes, some coarse and some painted pottery and a few copper tools. The suggested date was c. 1000 B.C. The second phase was dated by coins to the 3rd and 1st centuries B.C., and iron tools were already in use. The third phase showed a development from the second, and Roman trade pieces of glass and pottery were recovered. The two last phases showed aspects of known historic Indian periods. Such a stratigraphically fixed succession for India was of extreme importance.

While it was known that both Russian and Chinese archaeologists were at work in Siberia and Red China, few reports were received of their results. Karakorum, once the capital of Jenghiz Khan, in Outer Mongolia, was said to have been located and excavations begun. A great concentration of granite blocks and glazed tile was identified as the palace of Ogdai, a son of Jenghiz. Reports came through Sweden of a spectacular find of Scythian graves made by Russian archaeologists west of Irkutsk. The bodies in the graves were frozen and still well preserved, and the yield of knowledge concerning clothing, hairdress and personal decoration, as well as physical type, was high. The graves also contained ritually slaughtered horses and quantities of household goods, carpets and jewelry. (See also JUDAISM.)

(R. J. B.)

Western Hemisphere.—The Society for American Archaeology conducted its annual meeting in 1956 at the University of Nebraska, Lincoln, May 3–5. The well-known Mayanist, J. Eric Thompson, of the Peabody Museum of Archaeology and Ethnology, Harvard university, was the society's candidate for the 1955 Viking fund medal and award in archaeology.

In 1956 several hundred American archaeologists, under the aegis of more than 50 institutions and organizations, searched in the earth for solutions to the problems surrounding the time and manner of the peopling of the new world, the growth, spread and decline of Indian cultures, and their complex interrelationships. Much of this activity was of salvage character, imposed by the accelerated destruction of archaeological resources through building expansion, dam and highway construction.

Early Man.—Several recent discoveries and some new radiocarbon dates broadened the conception of probable antiquity and cultural diversity among the earliest American hunters, whose taste for elephant meat was attested by increased archaeological evidence. In the San Pedro valley, near Hereford, Ariz., the attention of the Arizona State museum of the University of Arizona, Tucson, was directed to mammoth bones weathering out of a dry stream bank. In a concentration of bones covering approximately 15 by 30 ft., William W. Wasley, E. B. Sayles, John Lance, Emil W. Haury and ten students from the department of anthropology found scattered remains of at least eight mammoths, mostly young animals, together with a few bones of the early bison, tapir and horse. Among the parts were 13 Clovis projectile points, illustrating the typological range of this pre-Folsom form, and 8 cutting and scraping tools, the latter indicative of food preparation on the spot. Two hearths found in the same bed supported this assumption, and yielded datable charcoal which, when radiocarbon-analyzed, was expected to show that hunters killed and butchered their game more than 10,000 years ago.

Much more doubtful were the dwarf mammoth discoveries in California which had continued from 1947. This Pleistocene or Ice Age species, standing four to six feet high, seemed to have been killed in large numbers by other and earlier people than the palaeo-Indian makers of the Clovis points; indeed, no weapons had come to light, although one chipped stone artifact and occasional occurrences of abalone shells among the bones were reported. The remains of many of these mammals were exposed

along the northwest coast of Santa Rosa Island, off the Santa Barbara coast in southern California, buried about midway down in 75-ft. sea cliffs composed of late Pleistocene sediments. In many cases the surrounding clay was burned brick red and contained charcoal particles, which, together with the disarticulated, selectively broken and sometimes burned condition of the bones, strongly suggested the predation of human hunters.

In Sept. 1955 the Santa Barbara Museum of Natural History secured the co-operation of a group of specialists from the Western Speleological institute, the Scripps Institution of Oceanography of the University of California, La Jolla, and the Lamont Geological observatory of Columbia university. Burned mammoth bone, collected by Wallace Broecker of the latter institution and radiocarbon-analyzed, revealed the astonishing age of $29,650 \pm 2,500$ years, suggesting an even greater antiquity for this site than for the camel hunters' camp in Nevada (dated at more than 23,800 years). To account for how man in an apparently primitive cultural status managed to reach Santa Rosa Island, 30 mi. from the nearest coast, the hypothesis was advanced that in glacial times, when large amounts of water from the sea were known to have been locked up in thick and extensive sheets of continental ice, the sea level would have been lowered by at least the 120 ft. necessary to allow passage by foot from the mainland.

In the vicinity of Lewisville, Tex., R. K. Harris, Wilson W. Crook, Jr., and other members of the Dallas Archeological society discovered in Feb. 1956 a series of ten ancient hearths in an Upper Pleistocene formation, believed to correlate with the latest of the main periods of glaciation in the northern United States and Canada. These features consisted of basin-shaped pits 4 to 10 ft. in diameter and up to 18 in. deep, filled with burned earth and charcoal. A classic specimen of Clovis fluted point was trowelled out of the largest hearth, and the site as a whole contributed significant additional data on the food habits of the Clovis people. Besides the usual extinct large game animal bones associated with such points, remains of the tortoise, rabbit, deer or antelope, various birds and even mussel and snail shells showed that, even in a period of presumable game abundance, practically everything which came to hand was eaten.

Arctic.—Under sponsorship of the Smithsonian institution, the National Museum of Canada, the National Geographic society and the American Philosophical society, two major expeditions conducted excavations at five sites in Coats and Southampton Islands in Hudson bay, Canada, in the summers of 1954–55. Henry B. Collins headed parties which at various times consisted of J. Norman Emerson, William E. Taylor, Jr., Eugene Ostroff and James V. Wright. Near Native Point on Southampton Island, stone and sod house ruins, graves, stone caches and cairns of the recent Sadlermiut Eskimo were explored, but more significant were discoveries illustrating a long antecedent Eskimo culture stage known as the Dorset. The archaeologists were exceptionally fortunate in uncovering an early Dorset village of large size, composed of shallow refuse deposits rich in artifacts of stone, bone and ivory. At this level of Eskimo cultural development, radiocarbon-dated at $2,000 \pm 230$ years ago, dog sled transportation was unknown. The people, unable to pursue other game in winter, subsisted largely upon seal, walrus and fox, as attested by the midden contents.

Richard S. MacNeish of the National Museum of Canada dug again in 1956 at the Firth river site near the Alaskan-Canadian border in Yukon territory, on a deeply stratified site which contains one of the longest archaeological records known from the Arctic. Nine superimposed culture layers are represented, the upper three referable to the Eskimo, the middle three apparently bearing on the introduction of pottery and the lower three depicting the handiwork of a variety of primitive hunters. It appeared

both from the geographical and industrial evidence that this station on the narrow coastal plain had been visited by many of the early migrants from Asia.

Pacific Coast and Great Basin.—The University of Utah, Salt Lake City, summer field school, under the direction of Jesse D. Jennings and Dee C. Taylor, conducted excavations between Salina and Emory, Utah, at two open village sites of the Fremont culture. Only one such village had previously been explored. Strong cultural influences from the southwest into the Great Basin area were shown by the finds of masonry houses, adobe granaries, pottery and clay figurines.

In British Columbia, Charles Borden's work for the University of British Columbia, Vancouver, at the Marpole site resulted in a radiocarbon-dating of the lower level at about $1,950 \pm 125$ years ago. Since elk antler wedges, stone adz blades and stone mauls were found in this horizon, it is probable that the impressive woodworking industry of the northwest coast Indians was already established there 2,000 years ago.

Plains.—The western Canadian plains received belated archaeological attention under the auspices of the Glenbow foundation of Calgary, Alta. H. Marie Wormington of the Denver Museum of Natural History and William T. Mulloy of the University of Wyoming, Laramie, following an extensive survey of data covering the long period from early hunter to historic, excavated representative sites near Edmonton, Alta., and the Peace river.

Most of the 1956 salvage archaeology in the Missouri river basin project was centred in the Oahe reservoir area covering about 250 mi. between Bismarck, N.D., and Pierre, S.D. Parties from the State Historical Society of North Dakota, Bismarck, the U.S. national park service, the W. H. Over museum of the University of South Dakota, Vermillion, the River Basin Surveys unit of the U.S. Bureau of American Ethnology and the U.S. National museum laboured to save as much as possible of the great quantity of prehistoric and historic material expected to be covered by rising reservoir waters.

Eastern North America.—During the 1954-56 field seasons, the Illinois State museum, Springfield, explored an archaeological site in Randolph county, Ill. A crew of 15 college students supervised by Melvin Fowler and Richard Keslin excavated to a depth of 25 ft. in the Modoc rock shelter, formed by an overhang of the sandstone bluff comprising the eastern edge of the Mississippi flood plain. Five zones, recognized on the basis of soil content, represented the changing ecology of the area over approximately 10,000 years. The major assemblages, occurring in zones 2 through 4, were without pottery, and the artifacts, mostly of stone, threw light upon the food-collecting activities of Archaic culture groups, between about 6000-3000 B.C., according to carbon ¹⁴ samples. Prior to this discovery, the earliest Archaic cultures in the United States had been dated by similar means at around 3500 B.C.

During the summer of 1956, the New York State Museum and Science Service continued its excavations on Long Island, N.Y., on several prehistoric sites threatened with destruction by building expansion. A crew of six college students, directed by William A. Ritchie, explored two stratified shell midden settlement sites at Stony Brook and Wading river which together proved to span a long segment of the Archaic period. The upper stratum at Stony Brook constituted the first recorded major habitation site of the orient culture people, one of whose cemetery sites near Shinnecock, L.I., was also investigated by the group, which uncovered a burial pit with mortuary offerings of stone pots and hunting gear. A radiocarbon date for another burial site of this culture on Long Island showed that the orient culture flourished about 944 B.C.

As the result of 15 months of digging at Jamestown Island, Va., the principal habitation area of the first permanent English

settlement in America was uncovered by the U.S. national park service. More than 150 features were disclosed, among them establishments for ironmaking and working, pottery manufacture, brickmaking and gunsmithing; drainage and property line ditches; the earliest known ice-storage pit in the new world; and the settlement's first cemetery. Data and specimens obtained were expected to contribute greatly to the accuracy of the restorations of "James City" in the 1600s, scheduled to be opened in 1957.

Middle and South America.—The search for Mexican sources of various traits of prehistoric southwestern United States cultures received stimulation through the 1955-56 investigations of J. Charles Kelley at the Schroeder site in Durango, conducted by the Museum of Southern Illinois university, Carbondale. Of two distinct phases of occupation uncovered, the earlier Ayala phase, with simple block masonry, small house platforms and courts grouped around a plaza, was linked with the Colonial period of Hohokam culture in southern Arizona, while the Rio Tunul phase showed connections with the Sedentary stage of Hohokam.

The University of Pennsylvania, Philadelphia, with the co-operation of the Guatemalan government, began a major, long-term project of excavation and restoration at the immense, Classic period, Mayan city of Tikal on the Yucatan peninsula, Mexico. A training and research centre under the direction of John Dimick, with Linton Satterthwaite, Jr., as chief archaeologist, was created in Tikal for the study of Mayan civilization.

Archery. The 72nd annual National Archery association tournament was held at Ocean County park, Lakewood, N.J., Aug. 12-17, 1956, with 300 archers participating. The championship scores of the winners in all divisions were as shown in the table.

Target Archery

Men's championship		Joe Fries, Los Angeles, Calif.
Scores:	Double York round	1,813
	Double American round	1,498 3,311
Ladies' championship		Carole Meinhart, Pittsburgh, Pa.
Scores:	Double National round	1,048
	Double Columbia round	1,202
	Double American round	1,432 3,682
Men's American round division (free style)		W. G. Pierce, Hastings, Mich.
Scores:	Sextuple American round	4,056
	(Bare Bow)	
	Sextuple American round	4,022
Intermediate boys' championship		David Peterson, Long Beach, Calif.
Scores:	Double Hereford round	1,978
	Double American round	1,454 3,432
Intermediate girls' championship		Lynne Smathers, Brevard, N.C.
Scores:	Double National round	829
	Double Columbia round	1,031
	Double American round	1,252 3,112
Junior boys' championship		Kenny Smathers, Brevard, N.C.
Scores:	Quadruple Jr. American round	2,816
Junior girls' championship		Kay Ellen Volkman, Dayton, O.
Scores:	Double Jr. Columbia round	1,109
	Double Jr. American round	1,456 2,565
Beginner boys' championship		David Oelkerking, Bronxville, N.J.
Scores:	Quadruple Jr. Columbia round	1,929
Beginner girls' championship		Loy Elaine Volkman, Dayton, O.
Scores:	Quadruple Jr. Columbia round	2,220

Crossbow

Men's championship		Paul Eytel, Pluckemin, N.J.
Scores:	Quadruple American round	2,600
Ladies' championship		Lillian Eytel, Pluckemin, N.J.
Scores:	Quadruple American round	2,316

Flight Shoot

Men		Charles A. Pierson, Cincinnati, O.
50-lb. class:	483 yd. 1 ft.	Charles A. Pierson
65-lb. class:	498 yd.	Charles A. Pierson
80-lb. class:	515 yd. 1 ft.	Charles A. Pierson
Unlimited class:	485 yd. 2 ft.	Charles A. Pierson
Free style (footbow)	686 yd. 2 ft.	Charles A. Pierson
Women		Margaret Breneman, Columbus, O.
35-lb. class:	366 yd. 2 ft.	Barbara Van Popering, Old Greenwich, Conn.
50-lb. class:	440 yd. 1 ft.	Barbara Van Popering
Unlimited class:		449 yd. 2 ft.
Intermediate boys		Larry Briggs, Jr., Amherst, Mass.
35-lb. class:	179 yd. 2 ft.	Roy Van Tassel, Brooklyn, N.Y.
50-lb. class:	391 yd. 2 ft.	Roy Van Tassel
Unlimited class:	292 yd.	

Flight Shoot—continued

Intermediate girls		No entries
Junior boys		
35-lb. class:	329 yd.	Jim Dillon, Parma, O.
50-lb. class:	405 yd. 2 ft.	Jim Dillon
Unlimited class:	359 yd. 2 ft.	Jim Dillon
Junior girls		No entries
Beginner boys		No entries
Beginner girls		No entries
Crossbow, men		
50-lb. class:	402 yd.	Col. Francis E. Pierce, Coronado, Calif.
65-lb. class:	394 yd. 2 ft.	Col. Francis E. Pierce
80-lb. class:	406 yd. 1 ft.	Col. Francis E. Pierce
Unlimited class:	456 yd. 1 ft.	Col. Francis E. Pierce
Crossbow, women		
35-lb. class:	278 yd. 1 ft.	Fannie Brumble, Cincinnati, O.
50-lb. class:	336 yd.	Fannie Brumble

Clout Shoot

Men	(36 arrows at 180 yd.)	Robert Rhode, Lamont, Ill.	36-302
Ladies	(36 arrows at 140 yd.)	Eleanor Moczadlo, Cleveland, O.	34-284
	(36 arrows at 120 yd.)	Julia Ann Heagey, Lancaster, Pa.	36-290
Intermediate boys	(36 arrows at 120 yd.)	David Peterson, Long Beach, Calif.	36-290
Intermediate girls	(36 arrows at 120 yd.)	Lynne Smathers, Brevard, N.C.	36-294
Junior boys		James Horwitz, Belmont, Mass.	34-238
Junior girls		Janet Leder, Cincinnati, O.	36-272
Beginner boys		David Oelerking, Bronxville, N.J.	27-143
Beginner girls		Loy Elaine Volkman, Dayton, O.	34-200
Senior men—crossbow		Col. Francis E. Pierce, Coronado, Calif.	35-307
Senior women—crossbow		Fannie Brumble, Cincinnati, O.	35-269

The Cleveland Archery club of Cleveland, O., again dominated the team event as it did at the 1955 national tournament at Oxford, O. With a team of four men a new national record in the men's team event (96 arrows at 60 yd.) was established of 384 hits for a total of 2,856 points.

Joe Fries, men's national champion in 1955 and 1956, established a new individual team record of 96-794.

The women's team round (96 arrows at 50 yd.) was won by the Lancaster Archers, whose team of four women scored a total of 379 hits for a total of 2,531 points. (J. R. K.)

Architecture. The building boom of 1955 carried over into 1956 in the United States, new construction of all types reaching a rate of \$44,000,000,000 a year in June. While residential construction for the first six months was 10% below the 1955 peak, new industrial and commercial buildings made up the loss in dollar volume; industrial construction was running 27% above 1955 and commercial building, mainly office buildings, stores, shopping centres and banks, was up 20%. Part of the difficulty in home construction was the result of tighter credit conditions, but congress increased by \$3,000,000,000 the allowable amount of home mortgage insurance. Despite rising material prices, home buyers of 1956 preferred larger houses with larger rooms, more bedrooms and baths and separate dining rooms. Builders predicted that 1956 would produce 28% fewer houses priced below \$15,000 and 61% more homes priced above \$15,000. In July congress authorized the construction of 70,000 public housing units during the next biennium.

According to estimates of current projects in architects' offices, 12 regional directors of the American Institute of Architects reported that architectural activity had increased as much as 15% to 20% over 1955 in five regions and up to 15% in the seven remaining regions. In all but two the principal activity was in school buildings, closely followed by commercial work. Commercial construction had overtaken schools in Texas while in the western mountain areas public building was in first place.

The 88th annual convention of the American Institute of Architects was held in Los Angeles, Calif., May 15-18, 1956. Leon Chatelain, Jr., of Washington, D.C., was elected president for the coming year; John Noble Richards of Toledo, O., was chosen as first vice-president; Philip Will, Jr., of Chicago, Ill., second vice-president; Edward L. Wilson of Ft. Worth, Tex., secretary; and Raymond S. Kastendieck of Gary, Ind., treasurer. Thirty-five members of the institute were advanced to the rank of fellow. The gold medal, highest professional honour given by the institute, was awarded to Clarence Stein of New York city, internationally recognized for pioneering work in civic design.

Design.—Five buildings were selected for first honour awards in the institute's eighth annual competition for outstanding American architecture: Hillsdale high school, San Mateo, Calif., John Lyon Reid and Partners, San Francisco, architects; Center for Advanced Study in Behavioral Sciences, Stanford university, Palo Alto, Calif., Wurster, Bernardi and Emmons, San Francisco, architects; Lambert-St. Louis Municipal Airport terminal, St. Louis, Mo., Hellmuth, Yamasaki and Leinweber, St. Louis and Detroit, architects; Manufacturers Trust Company building on Fifth avenue, New York city, Skidmore, Owings and Merrill, architects; and the Hodgson house, New Canaan, Conn., Philip C. Johnson, New York, architect. Fourteen buildings including residences, commercial buildings, hotels, churches, a medical centre and a police facilities building were selected by the jury for awards of merit.

Among the nation's much-discussed buildings was the Price tower in Bartlesville, Okla., by Frank Lloyd Wright, completed early in 1956. The tower is described as a "single immense cruciform reinforced-concrete column"; each floor is a cantilever slab and the outer envelope a pattern of bands of concrete and copper-sheathed spandrels. The recently consecrated Church of Jesus Christ of Latter Day Saints, Los Angeles, Calif., Edward O. Anderson, architect, which is a golden-tan modernist temple in a vein now popular with the Mormons, also attracted attention. An estimated \$850,000,000 was spent on new churches throughout the country. Winners of 1956 architectural awards at the annual National Joint Conference on Church Architecture were: Richard J. Neutra, architect for the Navy chapel at Miramar, Calif.; Harold Wagoner for the Presbyterian church, Vero Beach, Fla.; Alfred Pries for the First Methodist church, Honolulu, Haw.; and Frederick Hodgson for the First Evangelical United Brethren church in Santa Ana, Calif.

In Hollywood, Calif., Capitol Records erected a 13-story edifice, the world's first circular office building, and early in the year the circular steel-and-glass St. Patrick's high school was opened at Kankakee, Ill. These circular structures recall the projected art museum designed by Frank Lloyd Wright for the Solomon R. Guggenheim foundation of New York city.

Two research laboratories, one for General Motors at Warren, Mich., another for the United States Steel corporation at Monroeville, Pa., opened in May. The campus-style buildings at Warren are grouped around a 22-ac. lake and dominated by a 132-ft. stainless steel water tower. The buildings have window walls, and extensive use is made of glazed brick in a variety of colours. New York city's \$35,000,000 Coliseum, the world's largest exhibition hall, including a 20-story office building and basement parking for 850 cars, opened late in April.

Forty-nine Chicago area architects, builders, craftsmen and artists received recognition for superior design and construction on June 7 at the city's second annual Civic Pride luncheon. Honour awards went to the Prudential building, Naess and Murphy, architects; the American National Bank and Trust Co., Skidmore, Owings and Merrill, architects; the Hubbard Woods fashion centre, Cone and Dornbusch, architects; the city parking facility at 120 N. La Salle St., Friedman, Alschuler and Sincere, architects; the Highland Park high school, Loehl, Schlossman and Bennett, architects; and the Elliott chapel of the Presbyterian home in Evanston, Schmidt, Garden and Martin, architects. Citations of merit were awarded to a number of recent structures, among them the attractive St. Andrew's Lutheran church in suburban Park Ridge, Edward Stadel and Associates, architects; and the St. Paul Federal Savings and Loan association, Holabird and Root and Burgee, architects.

New Materials and Methods.—Manufacturers strove to perfect curtain wall panels of lightweight concrete, glass, aluminum, stainless and porcelain-enamelled steel, bronze, stone, terra cotta

and plastics, permitting lighter frames, more rapid construction and new aesthetic effects. These were well illustrated in the 19-story Inland Steel building in Chicago, sheathed with stainless steel, and the Signode Steel Strapping company's new plant in suburban Glenview, clad with five-inch lightweight concrete panels which permitted the 80,000 sq.ft. of walls to be enclosed in six days.

Structures that attracted attention because of new or unique shapes or methods were the steel sphere designed to house the atomic power plant at West Milton, N.Y., and the proposed Pittsburgh Civic auditorium, 415 ft. in diameter, capped with a retractable dome which opens up to reveal an open-air arena seating up to 14,000 people. The Lambert-St. Louis Municipal Air terminal attracted attention because its roof was in the form of three great groin vaults of thin-shell concrete covering an area 415 ft. by 120 ft. uninterrupted by columns. Similarly, the Edsel Ford high school at Dearborn, Mich., was Michigan's first building roofed with thin-shelled concrete vaults. The domed auditorium of General Motors' Technical centre, with a luminous 88-ft. ceiling, provided shadowless lighting, and the new Cherry Hill laboratories of the Radio Corporation of America near Camden, N.J., and the building of the Lutheran Brotherhood in Minneapolis, Minn., encased in colourful porcelain-enamelled steel wall panels, wrote new notes in architectural polychromy.

Other Countries.—In west Berlin, Ger., three structures were under construction, financed in part by United States aid: a \$6,000,000 hotel, a congress hall and a huge garment centre housing 35 to 40 clothing firms. The congress hall, intended for cultural meetings and conventions, was to be the United States' official entry in Berlin's 1957 International Building exposition. The city of Cologne, Ger., held a competition for the redesign of the area surrounding Cologne cathedral, while at Stuttgart, Ger., Fritz Leonhard designed and erected a reinforced-concrete television tower 692 ft. high with two elevators to the observation tower and two aerial restaurants, cantilevered from the shaft. This structure recalls the handsome Microwave tower at Nutley, N.J., Rossetti, Giffels and Vallet, architects. Monaco rushed to completion a new residential and civic centre dominated by a 14-story luxury apartment house, a four-story block of studio apartments and a six-story administration building; only the jail remained to be completed.

In India, the government had under construction a new capital city at Chandigarh. Working with the renowned French architects Le Corbusier and his cousin Pierre Jeanneret were British and Indian architects. Le Corbusier's Supreme Court building of reinforced concrete employed brick walls, and, to meet climatic conditions, a structural "umbrella" was raised above the roof. Oscar Niemeyer, noted Brazilian architect, designed a modern art museum for Caracas, Venez., in the form of an inverted truncated pyramid with the main gallery at the top, lighted with a system of louvers. Jean Maunoury of France, architect of Chartres cathedral; Gustavo Wallis, past president of the Ninth Pan-American Congress of Architects; Ernesto N. Rogers, Italian architect; and Edmundo G. Lucero, president of the Philippine Institute of Architects, were awarded honorary membership in the American Institute of Architects for distinguished service to architecture. A multistory group of family apartments, each with an outside balcony, was completed during 1956 in Toronto, Ont., Page and Steele, architects. (See also MUSEUMS.) (R. NB.)

ENCYCLOPEDIA BRITANNICA FILMS.—*Building America's Houses* (1947); *The Living City* (1953).

FRANK LLOYD WRIGHT (left) exhibiting his design for a mile-high skyscraper at a press conference in Chicago, Ill., Oct. 16, 1956. The 528-story building would be equipped with atomic-powered elevators to carry the 130,000 tenants

Areas and Populations of the Countries

of the World. The political entities of the world are listed here with their areas, populations and number of persons per square mile. The latest census or latest estimate is given for each country. Areas in square miles are in accordance with the boundaries for the year of the population figure unless otherwise noted. Some of the later boundary adjustments had not been recognized at the end of 1956 by the U.S. government. The subtotals for colonial groupings within continents do not carry density figures. The table provides a fundamental basis for country comparisons.

Areas and Populations of the Countries of the World

(For statistical details and dates see separate articles)

Name of continent and state	Area (in sq.mi.)	Population (in thousands)	Persons per sq.mi.
World total	58,332,990	2,684,660	51.3*
AFRICA	11,683,824	217,909	18.7
Belgian colony and trusteeship	925,733	16,675	
British colonies, dependencies, protectorates, trusteeships and condominium	2,030,057	69,503	
Egypt	386,100	22,934	59.4
Ethiopia (incl. Eritrea)	457,142	16,000	35.0
French colonies, trusteeships, protectorates, departments and overseas territories	4,074,802	41,176	
Italian Somaliland	198,275	1,269	6.4
Liberia	43,000	1,250	29.1
Libya	679,358	1,092	1.6
Morocco	174,471	9,669	55.4
Portuguese colonies	794,959	11,124	
South-West Africa (mandate of Union of South Africa)	317,725	458	1.4

Argentina. A republic occupying the southeasternmost section of South America, Argentina is bounded on the north by Paraguay, Bolivia and Brazil; on the south and west by Chile; and on the east by Uruguay, the Río de la Plata and the Atlantic ocean. It is the second largest Latin American nation—only Brazil is larger—with an area of 1,084,359 sq.mi. and a population of 19,108,000 (est. 1955), mostly of European ancestry. The capital and leading port, Buenos Aires, had by the 1947 census 2,981,043 (1952 est. 3,403,600). Other leading cities with 1950 populations, are: Rosario, 467,937; Córdoba, 369,886; Avellaneda, 278,621; La Plata, 207,031; Lanús 244,473; Tucumán, 194,166; Santa Fé, 168,791; Lomas de Zamora, 125,943; Quilmes, 115,113; Mar del Plata, 114,729; Mendoza, 97,496; and Bahía Blanca, 112,597. Religion: Christian, mostly Roman Catholic. President in 1956: Gen. Pedro Eugenio Aramburu.

History.—During 1956 the provisional government of Argentina was plagued by subversive activity frequently accompanied by violence. President Aramburu adopted a hard anti-Peronist policy. On June 9, a bloody 12-hr. revolt erupted in La Pampa, Santa Fé and Buenos Aires provinces, which was variously blamed on civilian supporters of the Gen. Juan D. Perón regime, discontented army elements and the Communists. The government declared martial law, and government forces quickly

brought all affected areas under control.

The government arrested 2,500 civilian and military personnel, netting two-thirds of the guiding triumvirate, and executed 38. Gen. Juan José Valle, a Perón favourite, was executed. Raúl Lagomarsino, millionaire hatmaker, was sentenced to death but spared when Aramburu revoked martial law on June 13 and commuted pending death sentences to life imprisonment. Raúl Tanco, another Peronista ex-general, found asylum in the Haitian embassy and later went into exile in Venezuela.

Argentine politics appeared to have regained its pre-Perón vigour. The greatest stimulus to action was Aramburu's July announcement that elections would be held in the last quarter of 1957. The Partido Demócrata (Conservative) and the Radical party seemed to be aiming at the discontented and dispossessed adherents of Perón when both criticized Aramburu's harsh anti-Peronista policies and demanded a general amnesty. Political arguments also centred on Aramburu's vague plans to decree a statute governing the internal organization of political parties, and to have a constitutional assembly either before or after the elections. Decrees prohibiting military men or functionaries of the provisional government from running for office were criticized only by the right-wing ultranationalists.

At the end of April Aramburu decreed the restoration of the 1853 constitution. In June the provisional government reduced the number of cabinet ministries from 17 to 13 by fusing the functions of finance with treasury, commerce with industry, education with justice, and communications with transport. There was general agreement that the new cabinet was the most cohesive since the revolution.

In a final report published in January, economist Raúl Prebisch advised the government to strive for increased production, establishment of incentives to private enterprise, a multilateral foreign trade policy, and foreign loans and investment capital. The government successfully carried out the two latter recommendations.

Trade agreements allowing for convertibility of currency were negotiated with several European countries. An economic mission to the United States succeeded in getting immediate Export-Import Bank of Washington, D.C., loans exceeding \$100,000,000 to rehabilitate the run-down transport system, and private foreign investment took a noticeable upswing.

In the reorientation of the domestic economy, labour presented the most serious problem. Neither labour nor employers appeared willing to accept the implied austerity of Prebisch's recommendations. Negotiations to renew labour contracts dragged through the year. A general 10% wage increase was granted in February to ease the adjustment resulting from devaluation after the 1955 revolution, but serious attempts to renegotiate contracts were not begun until July. Government control had been assured when the Confederación General del Trabajo was broken up after Perón's downfall with all unions being placed under the supervision of "interventors." Constant union demands for freedom from restraints, however, led to several serious strike threats. In mid-year, unions were allowed to select bargaining representatives, and talks were begun. Employer reluctance to meet heavy wage demands placed most cases in the hands of the labour ministry, which under existing regulations had to arbitrate in the event of deadlocks. Finding no solution to the problem of whether to grant wage scales unacceptable to employers or to face serious labour troubles if substantial raises were not granted, Labour Minister Raúl Migone resigned in September, leaving his successor, Horacio Aguirre Lagarreta, with a potentially explosive situation.

The daily *La Prensa*, confiscated by Perón in 1951, heralded the return of freedom of the press on Feb. 3 by appearing once again under the guiding hand of publisher Alberto Gainza Paz. Other papers, however, displayed something less than enthusiasm,

since *La Prensa's* newsprint quota was twice that of any other daily. Government reluctance to reduce restrictions on the importation of newsprint was a source of irritation, but plans for 1957 called for relatively free import policies as well as a substantial increase in domestic newsprint production.

(See also ANTARCTICA; FOREIGN INVESTMENTS.) (R. H.N.)

Education.—On June 30, 1951, there were 15,874 primary schools with 2,446,138 pupils and 101,646 teachers; 2,069 public secondary, normal and special schools with 360,917 students and 46,204 teachers; 32 autonomous schools with 2,544 students and 206 teachers; and 1,132 private schools with 153,926 students and 4,993 teachers. There were national universities at Buenos Aires (41,325 students), La Plata (7,409), Córdoba (9,335), Cuyo (2,596), Tucumán (3,191) and the National University of the Litoral at Santa Fé (16,325). University professors numbered 3,621.

Finance.—The monetary unit is the peso, valued during 1956 at 5.56 cents U.S. currency, official rate, and at a free market rate ranging during the first 11 months of 1956 from a high of 3.6 cents (Aug. 7) and a low of 2.38 cents (Feb. 20). The 1956 budget (preliminary) projected total expenditures at 35,029,000,000 pesos, including 26,198,000,000 pesos for the national administration, 3,077,000,000 pesos for autonomous institutions and 3,754,000,000 pesos for special accounts. Cash receipts were estimated at 26,667,000,000 pesos; the deficit of 8,362,000,000 pesos was to be financed by bond issues. The national debt (all internal) was 41,684,000,000 pesos on Dec. 31, 1954; the figures did not include the debt of official agencies and of provincial and municipal governments. Currency in circulation (Feb. 29, 1956) was 30,400,000,000 pesos; demand deposits, 22,900,000,000 pesos. The U.S. department of commerce estimated U.S. direct private investments in 1955 at \$446,000,000, of which \$230,000,000 represented investments in manufacturing. The cost-of-living index (Buenos Aires) stood at 135 in Aug. 1956 (1953 = 100).

Trade and Communications.—Exports in 1955 were officially valued at 7,297,645,000 pesos (U.S. \$928,119,000) and imports at 8,904,620,000 pesos (U.S. \$1,175,571,000). Leading exports were meat (28%), cereals and linseed (23%), wool (14%), hides (6%) and dairy products (5%); leading imports, machinery and vehicles (23%), iron and steel and manufactures (16%), timber and products (11%), fuels and lubricants (11%) and chemicals and drugs (8%). Leading customers were the U.K. (24%), the U.S. (18%), Brazil (12%), Italy (5%) and Germany (5%); leading suppliers, the U.S. (15%), Brazil (9%), the U.K. (7%), Germany (7%) and Japan (7%).

Railways (1949) totalled 26,893 mi. In 1952 there were 248,400 mi. of road, of which 41,000 mi. were national and provincial highways. Registered motor vehicles (Jan. 1, 1955) included 314,185 automobiles, 148,505 trucks and 14,903 buses. Telephones (Jan. 1, 1955) numbered 1,080,272, of which 81.9% were automatic and 56% were located in Buenos Aires. According to *Lloyd's Register of Shipping*, the merchant marine (June 30, 1955) had 364 vessels (100 tons and over) aggregating 1,043,056 gross tons.

Agriculture.—Production figures for the crop year 1955-56 were officially reported as follows (in metric tons): wheat 5,250,000; maize 3,870,000; barley 951,000; oats 732,000; rye 653,000; linseed 231,000; cottonseed 220,000; rice 174,000; tobacco 37,530; sunflower seed 732,000. Grain exports in 1955 (metric tons) included wheat 3,581,900; maize 375,000; rye 319,000; oats 97,000; barley 495,000.

The 1952 livestock census showed 45,262,995 cattle, 54,683,731 sheep, 3,989,188 pigs, (census 1947) 7,237,663 horses, 4,933,679 goats. Wool exports in 1955 were reported at about 104,900 metric tons, of which 40,439 tons went to the U.S., 14,578 tons to the U.K. and 10,726 tons to the Netherlands. Meat production (1955) was about 1,437,000 metric tons; exports included 1,159,858 frozen beef quarters, 1,519,787 chilled beef quarters, 370,880 frozen mutton carcasses and 3,094,495 frozen lamb carcasses.

Manufactures.—According to the 1954 industrial census, there were 181,763 manufacturing and mining establishments with 1,536,530 employees. Production figures for 1955 included portland cement 1,848,000 metric tons; cotton yarn 94,400 tons; wheat flour 2,081,000 tons; sulphuric acid 100,000 tons; steel ingots 180,000 tons; rolled steel products 667,000 tons; manufactured gas 337,200,000 cu.m. Installed electric energy capacity at the end of 1955 was 2,069,000 kw.; production in that year (public use only) totalled 5,944,000,000 kw.hr. The index of industrial production stood at 118 in 1955 (1953 = 100).

Minerals.—Petroleum production in 1955 totalled 4,847,448 cu.m. (30,538,000 bbl.), more than 80% of which came from government fields. Production of lead was estimated at 19,800 short tons in 1955; zinc 23,401 tons; coal 146,000 tons. In 1955, 8,372,259 metric tons of fuels and lubricants were imported.

Arizona. Arizona, the "Grand Canyon state," is located in the southwestern part of the United States, bounded on the west by the Colorado river and Nevada and on the south by Mexico. The area is 113,575 sq.mi. The population (1950 census) was 749,587, when whites numbered 654,511, Negroes 25,974; Indians 65,761, Japanese 760 and Chinese 1,644. The provisional estimate for the July 1, 1956, population of the state, as reported by the U.S. bureau of the census, was 1,057,000. The capital, Phoenix (Sept. 1956 estimate) numbered 170,000, city limit, and 500,000, municipal area. Tucson (1956 estimate) was 95,856

in city limits and 199,545 in municipal area.

The chamber of commerce estimated Yuma as 20,000 in 1956. Mesa (1950) had 16,700; Douglas, 9,942; Flagstaff, 7,663; and Prescott, 6,764.

History.—State officers (1956) were: chief justice, Arthur La Prade; governor, Ernest W. McFarland; secretary of state, Wesley Bolin; treasurer, R. T. Williams, Jr.; attorney general, Robert Morrison; superintendent of instruction, Clifton L. Harkins.

A code commission had been named in 1954 to revise the laws of Arizona passed since Arizona became a state in 1912. On Jan. 7, 1956, there ended a 76-day series of special sessions that had been working since Oct. 24, 1955, on the report of the commission. The code consisted of 5,142 pages, 75 pages of which were amendments adopted by both house and senate after their respective committees had consulted the leading law firms of the state. The reading of approximately 2,000,000 words before each house, two times before the final vote, presented a problem. Since it was almost time for the regular session to begin, the reading had to be done quickly. The senate had 20 persons reading at one time, and the house had 54. Single readers were used for the first reading, which took five days. Governor McFarland stated that the passage of the enormous code was the most important act in the history of the state.

The ground-water question again appeared in a senate bill that provided for applications for permits to construct wells within critical areas. The applicant for a permit should state the location of the well, the ground-water basin, the acre-feet per year to be used and the depth and type of construction.

A measure was passed increasing a number of salaries. The largest salaries to be received were: governor, \$18,000; attorney general, \$12,500; and superintendent of public instruction, \$12,000. Since the governor had asked that his salary not be increased, the secretary of state filed the bill April 3, and the governor permitted it to become a law without his signature. Because of the problem of juvenile delinquency, a bill made parents liable for torts of minors, providing that one or both parents having control or custody of minors would be liable, not to exceed \$500, for the damage done by minors.

In the November elections the Democrats had a majority of registered voters of more than 139,000, but Pres. Dwight D. Eisenhower polled a majority of votes of about 58,000.

The state officials, however, all remained Democrats, and all were re-elected except for a new treasurer, J. W. Kelly, and new superintendent of public instruction, Marion L. Brooks. Republicans won 2 of the 28 seats in the senate and 15 of the 80 seats in the house.

Education.—The enrolment in elementary schools and the number of teachers for 1955-56 were, respectively, 177,310 and 5,915; the corresponding numbers in high schools were 45,782 and 1,892. The appropriations (1956) for the University of Arizona at Tucson and the two state colleges at Tempe and Flagstaff were, respectively, \$4,201,195, \$2,329,717 and \$695,831.

Social Insurance and Assistance, Public Welfare and Related Programs.—The total number of persons receiving state assistance in March 1956 was 30,805. The appropriations for state welfare were: industrial school, \$340,021; state hospital, \$2,282,905; crippled children, \$341,020; dependent children, \$2,149,700; pioneer home, \$166,313; prison, \$1,269,520; school for the deaf and blind, \$500,920; tuberculosis sanitarium, \$299,597; old-age assistance, \$3,609,000.

Communications.—The Arizona highway department reported in Sept. 1956 road mileage as follows: primary state highways, 4,225; county roads, 16,497; federal-aid highways, 2,349; and national roads, 8,236. The Arizona corporation commission reported that as of Dec. 1955 there were 3,422 mi. of railroads, and that there were four commercial air lines in the state. Phoenix had (1956) ten radio and four television stations; Tucson had six and three.

Banking and Finance.—The superintendent of banks reported for June 30, 1956, that national banks in Arizona had deposits of \$570,512,875; loans and discounts, \$307,726,505; government securities, \$129,342,202. State banks had deposits of \$210,452,126; loans and discounts, \$90,072,474; government securities, \$82,392,350; each item but the last in both instances was in excess of the amount for the same month of the previous year. State and local taxes for the fiscal year 1955-56 were \$152,268,303, and the federal taxes were \$184,565,000.

The state indebtedness at the beginning of the fiscal year, July 1, 1955, was \$7,215,275.29, and there was an available balance of \$32,493,333.15. The state expenditures for the fiscal year beginning July 1, 1956, were listed at \$98,387,224.

Agriculture.—Arizona received during the first eight months of 1956 only 57% of average rainfall, according to the U.S. weather bureau sta-

Table I.—Principal Crops of Arizona

Crop	Indicated 1956	1955	Average, 1945-54
Barley, bu.	10,380,000	11,280,000	6,461,000

Alfalfa seed, lb.	6,100,000	4,480,000	7,300,000
Cotton, bales	840,000	728,000	559,000
Grapefruit, boxes	3,000,000	2,370,000	2,991,000
Oranges, boxes	1,320,000	1,150,000	1,022,000

Source: U.S. Department of Agriculture.

tioned at Phoenix. This not only reduced the returns of cattle raisers, but through the first eight months caused 1,303 forest and brush fires, further reducing pasturage. The dry weather resulted in early cotton picking, making a demand by Sept. 21 for 8,900 cotton hand pickers in addition to the many machine pickers in the state. Because of cotton acreage controls, farmers planted more wheat, some of which was used for pasture and hay. These crops were produced by irrigation.

Manufacturing.—Stanley Womer of the Arizona development board commented on the rapid development of industries in Arizona. The number employed in June 1954 was 26,100; June 1955, 31,900; and June 1956, 35,900. There were 450 plants in Phoenix. Hughes Aircraft of Tucson employed the largest number of any institution in the state. A new cement plant was being built at Clarksdale, a paper mill was planned for the Verde valley, and a uranium-processing mill was being built at Tuba City on the Navajo reservation. Old Fort Huachuca, used for military electronics, had grown into a real city. (H. A. H.)

Mineral Production.—Including only those items whose value was \$100,000 or more, Table II shows the tonnage and value of minerals produced in Arizona in 1954, compared with 1953. In 1954 Arizona was first among the states in recoverable copper output and in chromite, second in asbestos, third in bentonite and molybdenum, fourth in columbium-tantalite,

Table II.—Mineral Production of Arizona

Mineral	(In short tons, except as noted)		1954	
	Quantity	Value	Quantity	Value
Total		\$256,616,000		\$253,078,000*
Clays	197,000	715,000	254,000	814,000
Copper	394,000	225,883,000	378,000	222,977,000
Gold (oz.)	113,000	3,949,000	115,000	4,018,000
Lead	9,000	2,470,000	8,000	2,297,000
Lime	96,000	1,238,000	89,000	1,237,000
Molybdenum	1,000	1,426,000	?	?
Pumice	124,000	426,000	81,000	126,000
Sand and gravel	3,447,000	2,680,000	3,764,000	3,067,000
Silver (oz.)	4,351,000	3,938,000	4,299,000	3,891,000
Stone	442,000	619,000	1,205,000	1,914,000
Tungsten concentrate (60% WO ₃ basis)	134	469,000	132	457,000
Zinc	28,000	6,332,000	21,000	4,636,000
Other minerals	6,471,000	...	8,432,000

*Total has been adjusted to eliminate duplication in the value of clays and stone.

†Value included with other minerals.

silver (since 1943), and pumice, and fifth in diatomite (Arizona listed as a producer for first time), fluorspar, and in gold output. Arizona, 17th in rank, produced 1.81% of the U.S. total value of minerals.

ENCYCLOPEDIA BRITANNICA FILMS.—Arizona (1955); *The Southwestern States* (1954).

Arkansas. Arkansas, a south central state of the United States, often called the "Land of Opportunity," was admitted to the union in 1836. Its area is 53,104 sq.mi., including 429 sq.mi. of water. Pop. (1950 census) 1,909,511; (July 1, 1956, provisional est.) 1,815,000. The 1950 census placed 67% of the population in rural areas, compared with 77.8% in 1940. Indicating a population movement to the cities, the estimate of rural population amounted to only 60% in 1955. The population was listed as 77% native white, 0.5% foreign born and 22.3% Negro.

Little Rock, the capital city, had 102,213 inhabitants in 1950; other large cities were Fort Smith, 47,942; North Little Rock, 44,097; Pine Bluff, 37,162; Hot Springs, 29,307; El Dorado, 23,076; Fayetteville, 17,071.

History.—Gov. Orval E. Faubus was re-elected to a second two-year term to begin Jan. 1957. During 1955 and 1956, sweeping changes, administratively and legislatively, were made in the

state government. The general assembly reorganized the state's fiscal organization, but it left the legislature with broad post-auditing powers.

Two of the most significant additions to the governmental organization were the creation of the Arkansas Industrial Development commission and the Arkansas Publicity and Parks commission. Winthrop Rockefeller, who established his home in Arkansas in 1952, was appointed head of the development commission by Governor Faubus. John C. Sheffield, Helena, was appointed chairman of the Arkansas publicity and parks commission.

During 1956, two state parks were planned in addition to the eleven existing parks in the state, and a \$3,000,000 expansion and improvement program in the state's park system was undertaken.

Constitutional officers during 1956, in addition to Governor Faubus, included Nathan Gordon, lieutenant governor; C. G. (Crip) Hall, secretary of state; Jimmie "Red" Jones, state auditor; J. Vance Clayton, state treasurer; Bruce Bennett, attorney general; Sam Jones, land commissioner.

In the Nov. 1956 general election, the Democratic electors polled 54% of the votes for president, the ratio being 213,000 Democratic ballots to 186,000 Republican. Gov. Orval Faubus, Democrat, running for a second term, was re-elected, as was U.S. Sen. J. William Fulbright, also a Democrat.

Education.—For the school year 1954-55 Arkansas had 1,424 elementary schools with an enrolment of 266,271. Teachers and principals in elementary schools numbered 8,080; in secondary schools, 5,990. Expenditures for the year ending June 30, 1955, totalled, current, \$47,334,059; state sources, \$2,916,919; capital outlay, \$56,859,940. New construction for 1955 was \$7,864,469; bonded debt, \$5,354,561; on nonbonded debt, \$5,354,561; transfers, \$354,954. The grand total spent in Arkansas amounted to \$64,724,409. A. W. Ford was commissioner of education.

Social Insurance and Assistance, Public Welfare and Related Programs.—For the fiscal year ending June 30, 1956, old-age assistance grants in the amount of \$21,841,508 were paid to a monthly average of 54,861 recipients. A monthly average of 2,024 blind persons received a total of \$965,741; an average of 359 general relief cases (temporarily disabled) received \$58,974.03; and an average of 5,209 permanently and totally disabled persons received a total of \$1,966,168. Carl Adams was commissioner of welfare.

Unemployment benefits paid to about 38,000 persons during the fiscal year ending June 30, 1956, totalled \$6,544,019, a decrease of 22% from the previous year. There were 377,134 weeks of unemployment and an average weekly payment of \$17.98. The maximum weekly payment was increased from \$22 to \$26 during the year.

Arkansas maintained one penitentiary and four reformatories at a total expense of \$1,101,923.86 during the fiscal year 1955. The institutions housed an average of 1,518 adult and 305 juvenile inmates.

Communications.—Expenditures by the state government on highways during the fiscal year ending June 30, 1956, totalled \$38,600,000. At the end of that period, the highway system comprised 10,038 mi.; country road system, not in the state system, measured 57,905 mi. All highways and roads in the state (state, federal and local combined) totalled 73,831 mi.; total of 8,027 mi. were surfaced. New road and highway construction completed in the 1955-56 fiscal year aggregated 781.51 mi.; 152 new bridges were built during the year.

Main track railway mileage was 4,600; airway mileage about 1,000. There were 83 established airports. There were 324,272 telephones in use in the state.

Banking and Finance.—Arkansas had 182 state and 54 national banks on June 30, 1956. Deposits in state banks totalled \$460,899,256.50. Deposits in national banks totalled \$17,612,000; assets, national, \$565,999,000; state, \$508,372,879.50. There were 39 federal savings and loan associations and 6 active state building and loan associations.

Total expenditures for the state for the fiscal year ending June 30, 1956, amounted to \$168,945,307.17. Total revenue for the same period both general and special amounted to \$111,999,468.80. There was \$12,641,887.2 surplus from allotted funds, appropriated and federal funds.

Agriculture.—The U.S. department of agriculture estimated the value of crops harvested in Arkansas in 1955 at \$472,463,000, a 14% increase over the previous year. Cotton was the state's most valuable crop in 1955, worth \$302,768,000; rice ranked second with a value of \$56,488,000; crockers, the third money product, amounted to \$52,575,000; soybeans were valued at \$43,812,000.

Cash receipts to farmers from farm commodities sold during 1955 totalled \$547,703,000, a decrease of 4.8% over the previous year. Livestock accounted for \$168,784,000, or 31% of the total cash receipts.

Manufacturing.—The value of output of all manufactured goods for 1955 totalled \$1,082,000,000, an increase of 20.36% over the previous year. Changes in manufacturing for the quarter ending March 31, 1956, totalled \$5,259,758 and were paid to a monthly average of 88,932 employees. During 1955-56, the Arkansas Industrial Development commission reported 73 new industries established and substantial expansion made in 110 existing industries. The greatest new units were listed in food processing, wearing apparel and fabrics plants.

Table I.—Principal Crops of Arkansas

Crop	1956	1955	Average, 1945-54
Corn, bu.	16,900,000	19,558,000	22,488,000
Cotton, bales	1,510,000	1,663,000	1,382,000
Cottonseed, tons	608,530	678,000	558,000
Rice, 100-lb. bags	11,339,000	12,694,000	9,272,000
Oats, bu.	17,120,000	16,560,000	7,088,000
Potatoes, Irish, cwt.	576,000	660,000	788,000
Sweet potatoes, cwt.	273,000	377,000	344,000
Apples, bu.	673,000	35,000	464,000
Peaches, bu.	1,980,000	*	1,766,000
Grapes, tons	10,600	2,900	8,510
Pecans, lb.	6,000,000	7,950,000	4,449,000
Soybeans, for beans, bu.	26,866,000	21,906,000	8,226,000
Wheat, bu.	2,295,000	1,404,000	661,000

Stone	3,545,000	5,070,000	4,604,000	5,930,000
Other minerals	5,367,000	...	9,230,000

*Preliminary. †Total has been adjusted to eliminate duplication in the value of clays and stone. ‡Value included with other minerals. Source: U.S. Bureau of Mines.

More than 10,000 additional persons were employed in Arkansas industry during 1955-56.

An increase of nearly 10% was noted in the tourist industry, bringing an estimated 9,000,000 persons to the state for business and pleasure, who spent an estimated \$200,000,000 in the state. (O. E. F.)

Mineral Production.—Table III gives the tonnage and value of those minerals produced in Arkansas in 1953 and 1954, whose value was \$100,000 or more. Arkansas accounted for 95% of the bauxite output (used for aluminum production), and was first in barite output and second in manganese output in 1954. It ranked 21st in value of mineral output, with 0.94% of the U.S. total.

ENCYCLOPEDIA BRITANNICA FILMS.—The Southeastern States (1956).

Armies of the World. During the year 1956 several major developments took place in the ground forces of the world.

A drastic change in the balance of arms power in the middle east was started by exchange agreements for military equipment between Egypt and Czechoslovakia. As a result Egypt strengthened its position as military leader of the Arab bloc, concluded several pacts for mutual action with its neighbours, and was able to furnish arms to other Arab nations. The flow of arms of Soviet origin into the middle east posed a major threat to Israel's ability to maintain equality with its neighbours.

Border incidents, some of serious proportions, continued between Israel and its neighbours, particularly Egypt, Jordan and Syria. Raids by Egyptian-trained guerrillas into Israel were countered by military action against Egyptian border posts, and on Oct. 29 Israeli forces invaded Egyptian territory in strength and soon conquered the Sinai peninsula.

Morocco gained its independence and the former colonial areas

of France and Spain and the international city of Tangier united into one country and organized an army. Meanwhile Algerian nationalists continued to engage a large proportion of the French army. French forces in Algeria reached as many as 400,000. With the war for independence in Algeria and the Suez canal crisis, France sent all but about 50,000 men of its regular forces out of the country.

Egypt's nationalization of the Suez canal was countered by an immediate redistribution of British and French forces to the middle east, although the Suez Canal zone had been evacuated by 80,000 British troops in June 1956. The British 10th armoured division was already in the area, half in Libya and the balance in Jordan and Cyprus. British strength on Cyprus was increased to a total of one parachute brigade, one commando brigade and eight infantry battalions. France sent elements of the 7th motorized division and the 10th parachute division from North Africa.

The Soviet Union announced a reduction of its armed forces by 1,200,000 men, and other nations of the eastern bloc also announced reductions in armed strength.

NATO.—Gen. Lauris Norstad (U.S. air force) succeeded Gen. Alfred M. Gruenther, also of the United States, as supreme commander of the forces of the North Atlantic Treaty organization (NATO). Major revisions were made in the organization and structure of component NATO forces as the strategy of nuclear deterrence was adopted. This strategy called for the use of tactical atomic weapons to defend western Europe. Within this strategy the use of conventional forces was limited and the requirement for extensive reserves reduced. The smaller countries of the Atlantic alliance were promised a wide variety of new weapons, including guided missiles and other nuclear-delivery systems, by Great Britain and the U.S. with the atomic warheads withheld until the imminence of hostilities. Stockpiling of heavy equipment and ammunition for 56 NATO reserve divisions was stopped and the material on hand added to the war reserves of the 40 active divisions in being. Seven western European nations agreed to prior agreement before any of them reduced their conventional armed forces in favour of nuclear weapons. Specific actions by NATO member nations included:

Iceland asked the U.S. to remove its troops.

France moved three full divisions and part of the combat strength of two other divisions, the sum total of all committed to NATO, to North Africa.

Italy dropped plans to organize 50 support battalions by 1958.

Norway commenced abandoning coastal defenses, rendered obsolete by the possibility of atomic attack.

Greece dropped plans for 5 active and 11 reserve divisions and concentrated on 4 active divisions.

NATO released the statistics on the defense expenditures of its 14 member nations during its seven-year existence, 1949-1956. Total expenditures were \$312,000,000,000, of which the United States spent \$250,000,000,000, while among other expenditures were: Belgium \$2,200,000,000; Canada \$9,700,000,000; Denmark \$670,000,000; France \$19,500,000,000; Greece \$625,000,000; Italy \$5,100,000,000; Luxembourg \$53,000,000; Netherlands \$2,300,000,000; Norway \$747,000,000; Portugal \$440,000,000; Turkey \$2,300,000,000; and Great Britain \$25,800,000,000. (It should be noted that these figures represent total defense expenditures of each nation; not solely the amounts allocated for NATO purposes.)

Warsaw Pact.—A formal military alliance of the eastern European nations was formed, consisting of the armed forces of the U.S.S.R., Czechoslovakia, Poland, Hungary, German Democratic Republic, Bulgaria, Rumania and Albania. These nations possessed a total of 250 divisions, and were under the command of Russian Marshal Ivan S. Konev. Warsaw pact nations announced manpower cuts of: U.S.S.R. 1,200,000; Czechoslovakia

34,000; Poland 47,000; Hungary 20,000; German Democratic Republic 30,000; Bulgaria 18,000; Rumania 40,000; and Albania 9,000.

SEATO.—The Southeast Asia Treaty organization members held their first combined manoeuvres, Operation "Firm Link," in Thailand in Feb. 1956. All member nations participated, although France and Pakistan only sent observers. Approximately 17,000 U.S., 15,000 Thai and 6,000 servicemen of other nations participated. The U.S. 2nd battalion 508th regimental combat team was airlifted to Bangkok from Japan, and a battalion of the 9th regiment of the U.S. 3rd marine division from Okinawa participated. A Filipino infantry battalion also was engaged.

Although SEATO possessed no military high command, staff talks of military advisors and liaison officers in Bangkok provided close liaison. The U.S., Great Britain and France helped the other member nations modernize, re-equip and train their forces. The U.S. provided training for almost 11,000 officers and noncommissioned officers, particularly from Pakistan, the Philippines and Thailand; France trained cadets from Pakistan and Thailand; and Great Britain trained personnel from Australia, New Zealand, Pakistan and Thailand. Strength of the SEATO powers in the southeast Asia area included:

Philippines, an army of 40,000 organized into two active divisions and two training divisions.

Thailand, an army of 90,000 men, organized primarily into battalions.

Australia, an army of 23,000.

New Zealand, an army of 9,200.

Great Britain, one combat division plus support troops.

France, a total of 25,000 men in Vietnam.

United States, two divisions in Korea, one in Japan, one in Hawaii and a marine division on Okinawa.

(See also SOUTHEAST ASIA TREATY ORGANIZATION.)

The Major Powers.—**Great Britain.**—*Organization.*—Defense expenditures dropped approximately \$100,000,000 during 1956, with about half of the amount from the army (\$47,600,000). The strength of the army was gradually being cut from 400,000, and there was discussion of reducing or abolishing the two-year conscription period. Army long-term plans called for a permanent future force of 180,000 regular soldiers plus 40,000 two-year conscripts. With the reduction in the strength of the army, consideration was being given to reducing the number of divisions in Germany from 4 to 2.

Divisional structures were reorganized for atomic warfare. Armoured divisions were cut from 10,000 to 8,000 men, and organized into battle groups each supported by an infantry brigade. Infantry battalions were streamlined with the heavy weapons company eliminated and its mortars and machine guns distributed to the three rifle companies. The base pay of soldiers was increased in an effort to get voluntary recruits to sign up for longer periods; those signing for less than six years would receive 3d 3s per week (\$8.81), while those for more than nine years received 4d 11s (\$12.74).

Disposition.—The strategic reserve maintained in the British islands consisted of the 1st and 3rd infantry divisions and the 24th infantry brigade. The 24th infantry brigade was organized as the army's model air-transportable unit. The Royal air force transport command maintained 13 Comet Mark II jet air liners and 6 Blackburn Beverly air freighters, the latter capable of carrying 94 fully equipped soldiers 1,000 mi. nonstop. This air transport could move the brigade to the middle east in 48 hr.

The 10th armoured division was stationed in Libya and on Cyprus. The 17th infantry division garrisoned Malaya, Singapore and Hong Kong. The 2nd infantry and 4th, 6th and 7th armoured divisions plus an independent brigade composed the army of the Rhine in Germany. Forces in Kenya were reduced from 6,500 to

PARENTS INSPECTING EQUIPMENT at Ft. Ord, Calif., in 1956. The visit to the camp, the first of its kind, permitted parents of recruits to see the activities of their sons in training

4,300. All but a battalion was withdrawn from Korea, and all troops were removed from Japan.

Of the 11 reserve territorial divisions, two numbering 18,000 men each were kept at full strength. The other nine reserve divisions were put on a stand-by basis, with eight of them all infantry at a strength of 12,000 men, and the 9th a reserve airborne division with five battalions of parachutists.

Communist China.—Defense costs accounted for 19.98% of the 1956 budget, or \$2,670,000,000. Military strength was 2,647,000, of which 2,500,000 were in the army. Marshal Peng, the defense minister, reported that 5,000,000 men had been fully demobilized since 1949 and that another 31 divisions and 8 regiments had been transferred as a whole to construction work.

Nationalist China.—The army was maintained at a strength of 21 divisions (12,000 men each) including two armoured divisions, plus a marine division. In addition the organization of nine reserve divisions was started. On Quemoy 70,000 troops and 20 artillery battalions were in place, plus 25,000 men and 2 artillery battalions on the Matsus.

France.—*Organization.*—Of a total budget of \$11,314,000,000, expenses for the war in North Africa were \$613,000,000. Forces in North Africa numbered 400,000 as 200,000 more reserves were recalled up to augment the forces there and replace the reserves whose period of service expired. Reserves recalled included those who served in 1952 and 1953. Approximately 200,000 of those troops who served in North Africa were demobilized.

Disposition.—The military command in Vietnam was closed in April 1956 as all but a few troops were withdrawn from that area. The five full strength NATO divisions and nine reserve divisions in France were depleted of combat strength, which was all sent to North Africa and replaced by reservists by retention of conscripts beyond the 18-month service period and by native North African troops. Elements of the 7th mechanized division and 19th parachute division which had been transferred from France to North Africa were in turn transferred to Cyprus at the time of the Suez canal crisis. In addition to the major part of these units, the 19th infantry division and 4th motorized infantry division were located in Algeria. The latter patrolled the Algerian-Moroccan border to prevent infiltration of arms into Algeria.

In North Africa three divisions were concentrated in the area along the Moroccan border around Tlemcen and Marnia, where barbed wire sealed off a neutral area. Heavy fighting took place

in the Kabylie region east of Algiers. Large areas were placed under military command and cleared of nationalists, following which mobile defense units of residents were organized and armed for self-defense.

United States.—*Organization.*—The strength of the army was cut to 19 divisions, 10 regiments and 143 antiaircraft battalions, with total personnel of 1,034,500. The 1st cavalry division in Japan was reduced by one-third. The 75th regimental combat team on Okinawa was disbanded, and the 23rd infantry division at Fort Amador, Panama Canal Zone, and the 71st infantry division in Alaska were deactivated. A new airborne division, the 101st, was reactivated, joining the 82nd and 11th as airborne units. Designed for nuclear warfare and "brush fires," the 101st had more firepower than the standard airborne divisions and could be air transported with half the number of aeroplanes. The division of 11,500 (compared with previous airborne strength of 17,300 for three regiments) was organized into 5 self-contained combat groups. New equipment included the Spat, a 90-mm. self-propelled gun deliverable by parachute; a family of lightweight trucks; lightweight general-purpose machine guns; 105-mm. mortars; "Honest John" rocket units; and an airborne television system.

The army reserve system was reorganized to provide for 10 combat divisions of 14,000 men each plus 12 cadre divisions for training. In addition, the army components of the national guard totalled 425,000 men organized into 21 infantry and 6 armoured divisions plus 9 regimental combat teams, 9 armoured cavalry regiments, 123 antiaircraft battalions and 74 field artillery battalions. (See also SELECTIVE SERVICE, U.S.)

Disposition.—The 101st airborne division was activated at Camp Campbell, Ky. The 11th airborne division was transferred from Camp Campbell to Germany to replace the 5th infantry division which returned to Fort Ord, Calif. The 3rd armoured division at Fort Knox, Ky., replaced the 4th infantry division in Germany, which returned to Fort Lewis, Wash. The 2nd infantry division at Fort Lewis replaced the deactivated 71st division in Alaska. The 8th infantry division at Fort Carson, Colo., and the 9th infantry division at Goppingen, Ger., exchanged places. Headquarters of the 1st armoured division was transferred from Fort Hood, Tex., to Fort Polk, La. Elements of the 1st cavalry division remained in Japan. The 7th infantry division and 24th infantry division stayed in Korea, and the 25th infantry division remained on Hawaii.

The 6th army headquarters in the United States were maintained, with the 7th army in Germany and the 8th army in Korea. Corps headquarters maintained included 1st corps in Korea, 3rd corps at Fort Hood, Tex., 5th and 7th corps in Germany, 9th corps in Japan and 18th airborne corps at Fort Bragg, N.C.

The 10th special forces group remained in Germany, but was reduced in strength as was the 77th special forces group at Fort Bragg, N.C. Six field artillery battalions, the 531st, 557th, 601st, 558th, 530th and 559th, trained to fire the Corporal guided missile, were transferred from Fort Bliss, Tex., to Europe to augment the one battalion already there. (These units of 250 men had 3 launchers each. The Corporal is a surface-to-surface missile with a range of 75 to 100 mi.)

Equipment.—New items under development included the T-101, an airborne 90-mm. self-propelled gun with a tanklike body and a hull of light metals. With no turret and a crew of 3, the T-101 has a 6 cylinder air-cooled engine of 205 h.p. and a speed of 30 m.p.h. Experiments were conducted with a 4.2-mm. mortar mounted on an armoured personnel carrier. A combat radio helmet was under consideration for use in infantry units. Also being experimented with was a portable TV transmitter of 55 lb. capable of transmitting pictures a half mile. Among new equipment ordered were 600 M-48 Patton tanks mounting a 90-mm. gun

which had proven itself under nuclear attack in Task Force "Razor." Guided missiles were an important item of new equipment. Four in use and in the experimental stage included: the Dart, an antitank guided missile; the Corporal, a guided rocket; the Honest John, an unguided rocket of limited range; the Redstone, an intermediate range missile of 200 mi. range. (See also MUNITIONS.)

Training.—Several major training exercises were held during the year. "Lode Star," held at Camp Carson, Colo., tested cold weather and mountain operations in three phases over a 9-month period. "Command Post" held in various army areas in continental United States, tested ground support operations under atomic warfare conditions. "Cold Spot," involving 3,500 troops of the 1st infantry division and the 77th special forces group, dealt with mountain training. "Red Arrow" concerned the 1st infantry division at Fort Riley, Kan. "Northern Light," a two-month operation in Alaska, occupied the 82nd airborne division with airborne operations in the Arctic. "Sledge Hammer," at Fort Polk, La., stressed armoured manoeuvres of the 1st armoured division.

U.S.S.R.—The Soviet Union announced the further demobilization of 1,200,000 men to follow the original reduction of 640,000 men, with the target date of May 1, 1957, set for completion. The announcement stated that this would involve the disbanding of 60 infantry divisions and several brigades. The previous size of the army had been set at 175 to 200 divisions, of which 100 were at full strength. The reduction would probably bring the strength down to about 125 divisions, built around the 45 mechanized and 20 armoured divisions that constituted the bulk of the mobile strength. A reduction of 8.5% in expenditures for the armed forces resulted in the defense budget accounting for 18.2% of the total in 1956 compared with 19.9% in 1955.

Disposition.—As part of the demobilization plan, 33,500 troops were withdrawn from East Germany, although the 22 ground divisions there were not affected. In the Soviet Union approximately 60 divisions were maintained in western Russia and 40 east of the Urals.

Equipment.—The T-54 tank replaced the T-34 as standard equipment. The T-54, with a 100-mm. gun compared with the 85-mm. gun of the T-34, was powered by a long-range diesel engine, and had a high-quality aiming device particularly adapted for night firing. Considerable improvements were also made in standard artillery pieces: the range of the 122-mm. gun was increased to 25,000 yd.; the new 152-mm. gun was an improved version of the World War II gun; and the 203-mm. gun with a range of 28,000 yd. was towed by a prime mover. In addition, artillery support included a 240-mm. mortar, and 4-, 12- and 16-in. rocket launchers. Infantry firepower was increased by the distribution of 9-mm. automatic pistols. The mobility of the army was improved with the 4-wheel drive Pobeda trucks, and by the use of twin-rotor helicopters capable of carrying 50 men.

Afghanistan.—Afghanistan was reported to be using a portion of its \$100,000,000 loan from the Soviet Union for the purchase of arms from Czechoslovakia. Pakistan reported to SEATO that the Afghans had set aside \$40,000,000 for arms purchases that included rifles and light machine guns, and that some of these arms were reaching the Pathan tribesmen in the area of Push-toonistan currently under dispute between the two countries. Afghanistan sent a military mission to Czechoslovakia to inspect latest military equipment. The Afghan army of 50,000 remained mainly equipped with 1903 model Lee-Enfield rifles.

Austria.—This country started developing the army of 53,000 authorized under the peace treaty. Using the 6,000 frontier guards as a base, the army received at six-month intervals 12,000 recruits of the 20-year-old class drafted for 9-month periods, or 15 months if technicians. The goal was formation of 9 inde-

pendent brigades (or an over-all total of 108 battalions). Five of these would be mountain troops. Each brigade would have 3 regiments of infantry, a battalion of medium and light tanks, a battalion of artillery and one of signals and specialized troops. Equipment would come from the United States, but would initially consist of that left behind by Soviet, French, British and U.S. occupation troops.

Cambodia.—Cambodia announced that it would equip a 40,000-man army with U.S. matériel.

Canada.—Canada spent \$1,775,000,000 for defense in 1956, or 40% of the budget. A total of 24.7% of the defense expenditure was on the army of 47,000.

Czechoslovakia.—This country continued to maintain a strong separate national force, allied to, but not part of, the Soviet army. An announced cut of 34,000 men brought army strength to 230,000, organized into 4 armoured and 10 infantry divisions.

Egypt.—Egypt concluded a series of mutual defense pacts with Saudi Arabia, Yemen and Jordan, which together with that with Syria put the bulk of the Arab forces in a single command. Its cotton-for-arms deal with the Soviet bloc continued to bring in arms at the rate of about two shiploads a week. An analysis of the arms received during the year other than from the Soviet bloc showed: the last of a \$10,000,000 order from France including Mystère jets, light tanks and mortars; possibly about 16 Vampire jet aircraft from Italy; reconditioned British Valentine tanks, Bren gun carriers and armoured cars from Belgium. In addition, the production of Swedish-type M-45 submachine guns and automatic rifles was accelerated in the Maadi plant.

The army's strength was between 90,000 and 100,000, but this was augmented by the creation of a National Liberation army composed of the 50,000-man national guard plus youth volunteers. The National Liberation army was trained primarily for guerrilla warfare. Total trained reserves were 220,000.

An indication of the quality of the army equipment was given in the June 20 parade celebrating the taking over of the Suez canal from the British. Armoured equipment included: 28 Stalin tanks, 16 British Centurian tanks, 73 Czech-manufactured T-34 tanks and 96 Soviet-type ABC six-wheeled troop carriers; the artillery included 14 tractor-drawn 155-mm. guns; 25 Soviet SU-101 self-propelled antitank guns plus British 25 pounders; Swedish 40-mm. Bofors; the air cover included 23 MIG fighters, 24 Vampires, 9 Meteors and 23 Ilyushin twin-jet bombers.

Finland.—Finland maintained an army of 30,000 men, all but 1,000 of which were conscripts. Universal conscription required eight months' service and men were inducted quarterly during their 19th year. Equipment was mainly from World War II.

East Germany.—A formal announcement of the establishment of the Peoples army and its association with the Warsaw pact was made Jan. 1956. The strength of the army was 99,000. Matériel was not good. Total combat strength was seven divisions. Officers were reported training in Soviet Kazakhstan, and the U.S.S.R. delivered six atomic cannons.

West Germany.—The Bonn government enacted 14 constitutional amendments in March 1956 legalizing armaments and establishing civilian and military controls over the armed forces. Pertinent provisions included: a permanent parliamentary commission to control and investigate the armed forces; a 2/3 vote of the *Bundestag* before the armed forces could be used for internal police purposes; the *Bundestag* alone could decide when a state of war exists; the president could appoint and dismiss officers. A conscription bill requiring one-year's service was passed and registration of men 18 to 45 scheduled for Jan. 2, 1957, with the first call-up of 40,000 conscripts to be April 1, 1957. As a result of the short-term conscription, the army would consist of approximately 300,000 regular soldiers and 200,000 conscripts. During 1956 volunteers for the army averaged 4,500 a week, and

approximately 70,000 were in the army by the end of the year. Although no combat units were in operation, the cadres of five divisions (two armoured and two infantry divisions, and one parachute and one mountain brigade) were organized. There were ten instructional battalions and a school for field-grade officers. Eventual organization of the army called for six armoured and six motorized divisions by 1960, with interim stages of five armoured and three motorized divisions and an airborne and a mountain brigade by the end of 1957.

Germany agreed to continue to assist in the support of NATO troops stationed there, although the previous payment of \$760,000,000 annually was reduced to \$357,000,000 with \$154,700,000 to the U.S., \$95,200,000 to support British forces and the balance to others.

In addition to U.S. deliveries of \$476,000,000 worth of equipment under the Military Assistance program, orders were planned for 6,600 tanks and armoured assault vehicles for \$714,000,000 from the United States and Great Britain.

Hungary.—Hungary announced a cut in defense expenditures of \$350,000,000 for 1956 and a reduction in armed strength of 20,000 men.

India.—India launched a program of military modernization and ordered 40 British Centurian tanks, 40 Canberra jet bombers and other British equipment. The defense budget was \$420,000,000.

Iran.—Iran maintained an army of 150,000, partly U.S. equipped and trained, organized into nine infantry and three armoured divisions.

Iraq.—Although a member of the Baghdad pact, Iraq offered military assistance to Syria and Lebanon in the event of hostility from Israel; additional Mark VII Centurian tanks were delivered under the U.S. military aid program. The army was maintained at about 50,000 men organized into three divisions.

Israel.—Israel attempted to maintain the balance of arms in the middle east by obtaining additional equipment from the United States, Britain and France. Existing equipment was mixed and included U.S. Sherman tanks, French 155-mm. howitzers and French AMX tank destroyers equipped with a 75-mm. high-velocity gun. Infantry arms included the UZI submachine gun, manufactured in Israel, which was replacing British Sten guns. The defense budget was \$27,778,000. About 50,000 men were maintained on active duty. They were organized into three brigade groups supported by 20 independent tank companies of 12 tanks each plus two battalions of paratroopers. Within 48 hours this force could be expanded to 16 first-line brigade groups (250,000 men), and an additional 12 second-line groups could be mobilized in the event of need. The regular 2½ year conscription period was increased to 3½ years for the duration of the emergency.

Japan.—Japan passed a defense budget of \$250,000,000—an increase of 13% over 1955. Of the budget \$150,000,000 was for the army and permitted an increase of 10,000 in manpower to 160,000. The army was organized into six divisions of which two, plus a composite brigade, were on Hokkaido, one on Kyushu, and the others on Honshu and Shikoku. An agreement was reached with the United States whereby Japan's share of the joint defense costs (maintaining U.S. forces in Japan) would be decreased each year by half of the total increase in Japan's defense budget.

Jordan.—In March 1956 King Hussein dismissed Lt. Gen. Sir John Bagot Glubb, who had organized and then commanded the Arab legion for 36 years. Glubb was replaced by Brig. Gen. Radi Enab, who in turn was replaced by Maj. Gen. Ali Abu Nuwar in May 1956. With Glubb, all but 15 of the 60 British officers in the Arab legion were let go and replaced by Jordanians. The strength of the Arab legion was maintained at approximately 28,000 or-

U.S. ARMY EQUIPMENT TESTING TEAM on the desert near Yuma, Ariz., in 1956. Working in temperatures constantly near 100° F., the men shown above were testing tropical footwear. The new boots lasted 150 mi.

ganized into an infantry division, two armoured-car regiments and an antitank regiment. The national guard was expanded from 10,000 to between 30,000 and 40,000 men, and an Arab military aid program was organized to finance the expansion with \$10,000,000 raised by contributions of 25% each from Egypt, Saudi Arabia and Iraq, 10% from Syria and the balance from Lebanon and Jordan.

In addition to the long-standing mutual defense treaty with Britain and one with Iraq, agreements were reached with Lebanon to co-ordinate defense plans and unite forces in the event of war, and with Syria for a permanent body for military consultation and for joint operations in the event of war.

Arms and equipment were received from Egypt and Syria, and Iraq maintained a motorized brigade of 3,000 men near the border to aid in the event of an emergency. It was agreed that any joint Iraqi-Jordanian force operating from Jordan would have a Jor-

danian commander and an Iraqi deputy commander.

North Korea.—The North Korean government maintained an armed force of approximately 790,000 men, of which 300,000 were Chinese. The troops were reported to be trained in atomic warfare and equipped with artillery and missiles capable of firing atomic warheads.

South Korea.—South Korea maintained an army of 700,000 men organized into 20 army and 1 marine divisions on active duty and 10 reserve divisions. The U.S., which supplied \$400,000,000 yearly for military aid, agreed to support three additional divisions increasing the total from 31 to 34 divisions.

Libya.—The army in Libya was in process of being strengthened from 1,600 to 2,600 men. The U.S. and Britain sent about \$1,000,000 in arms to equip an armoured squadron. Equipment received included eight armoured half-track reconnaissance cars with .50- and .30-calibre machine guns, 81-mm. mortars and weapons carriers. Libya also received arms offers from Egypt and the U.S.S.R.

Morocco.—Morocco became an independent nation in March 1956 and established a royal army of 20,000 men, including 5,000 from the former "army of liberation." There remained sizable unabsorbed guerrilla bands in eastern Morocco and on the southern frontier with the French Sahara. The royal army was equipped by the French with \$3,000,000 worth of tanks, armoured cars, half-tracks, 105-mm. guns, jeeps, weapons carriers and trucks. The infantry was organized into 11 battalions. Ultimately, the 40,000 Moroccans still in the French army were to be absorbed into this force.

Poland.—Poland asked for the withdrawal of the two Soviet divisions from its territory and the recall of the Soviet officers which had been integrated into the Polish army in large numbers. This included Soviet Marshal Konstantin K. Rokossovsky, who had been defense minister and chief of staff of the Polish army since 1949. Strength was 18 combat divisions.

Sudan.—Following the establishment of Sudan's independence on Jan. 1, 1956, two shipments of arms were received from Egypt including 18 armoured cars, 18 tanks and 18 Bren gun carriers.

Sweden.—Sweden commenced reorganizing its army for atomic warfare into smaller regiments each composed of three battalions of three rifle companies (150 men each). The armoured brigade was equipped with British Centurian and Swedish light tanks.

Syria.—Syria was reported to have an agreement for the purchase of arms with the Soviet bloc. Staff discussions were held with Egypt and a joint command over the armies of both countries was headed by Egyptian General Mustafa Yusef, who also

headed a joint Egyptian-Saudi Arabian command. The army was maintained at more than 40,000 men. A bilateral defense pact was concluded with Lebanon providing for joint retaliation in the event one was attacked.

North Vietnam.—The Communist government maintained an army of 350,000 men equipped by Communist China. However, an announcement in June 1956 stated that a reduction of 80,000 men was being made, including 50,000 already demobilized since the 1954 armistice.

South Vietnam.—The strength of the army in 1956 was 150,000 men, supplemented by a 40,000-man National Security force and 50,000 village militia. During 1955 the United States supplied \$235,000,000 for defense as well as equipment for the army. The Vietminh were estimated to still have about seven battalions of guerrillas in the country.

(See also AVIATION, MILITARY; MUNITIONS; NAVIES OF THE WORLD; NORTH ATLANTIC TREATY ORGANIZATION.)

(L. B. K.)

Armstrong, Louis ("Satchmo") (1900–), U.S. jazz musician, was born in New Orleans, July 4. He gained local prominence playing the trumpet with Kid Ory's Brownskin Babies and Fate Marable's Mississippi river boat orchestra. In 1922 he joined Joe "King" Oliver in Chicago and two years later joined Fletcher Henderson in New York, where he began his long recording career. During the next seven years he worked with various bands in New York, Chicago and Los Angeles, the more prominent being Erskine Tate, Carroll Dickerson, Luis Russell and Les Hite. It was during this period that he organized his Hot Five and Hot Seven groups, with whom he made many recordings.

The success of his recordings abroad led to his first overseas tour in June 1932 when he played at the Paladium in London. The following year he returned to Europe for a second continental tour, and remained there until 1935. On his return to the United States he took over the Luis Russell orchestra.

During and after World War II he worked almost exclusively with small bands, making many tours of Europe and one of Japan and Australia. He also appeared in ten motion pictures and one stage production.

In 1955 Armstrong and his jazz band played to capacity houses on his three-month good-will tour of Europe, and in May 1956 attracted huge crowds on a tour taking him to London, Eng., Glasgow, Scot., and the African Gold Coast.

Armstrong was the first great jazz figure to attain world-wide recognition, not only as a trumpeter but as a singer and entertainer, and a vital force in stimulating international interest in jazz. The emotional intensity and basic simplicity of his solos, particularly in playing the blues, had no parallel in jazz.

Art Exhibitions. One of the few great private collections to be kept intact was the Jacquemart-André collection in Paris which was deeded to the Institut de France in 1912. Covering a wide period, it includes paintings by Andrea Mantegna, Carlo Crivelli, Vittorio Carpaccio, Paolo Uccello, Rembrandt and J. H. Fragonard. During 1956 an important selection from the collection was shown at the Wildenstein gal-

FROGMEN SEARCHING FOR MINES on a beach at Portsmouth, Eng., during a 1956 demonstration of amphibious warfare techniques for the staff colleges of the three British armed services

lery in New York city.

In honour of the bicentennial of the birth of the great composer Wolfgang Amadeus Mozart, the William Rockhill Nelson Gallery of Art in Kansas City arranged an exhibition of rococo art, including not only paintings of the 18th century but also furniture and decorative objects.

One of the most spectacular exhibitions of the season was at the National Gallery of Art in Washington, D.C., which celebrated its 15th anniversary with an exhibition of art objects acquired during the last five years by the Kress collection and the Kress foundation. These objects, which were expected to be given to the gallery at a later date, included a great painting by Rubens, "Decius Mus Addressing the Legions"; J. B. Chardin's "The Attentive Nurse" (from the Liechtenstein collection); a "Madonna and Child" by Albrecht Dürer; and, from the collection of Sir Francis Cook, "The Adoration of the Magi" by Fra Angelico and "The Swing" by Fragonard.

Walter P. Chrysler, Jr., sent a selection of his collection on tour to eight museums: Portland, Ore.; Seattle, Wash.; San Francisco and Los Angeles, Calif.; Minneapolis, Minn.; St. Louis and Kansas City, Mo.; and Detroit, Mich. The group included a great variety of artists, old masters such as Rembrandt, Rubens, Paolo Veronese and François Boucher as well as more recent artists such as Claude Monet, J. E. Vuillard and Chaim Soutine.

The Yale Art gallery showed "Pictures Collected by Yale Alumni," 250 oils, water colours and drawings lent by 100 graduates. The wide variety of material extended in date from the 15th-century Flemish artist Hans Memlinc to the contemporary U.S. artist Andrew Wyeth. Although well-known paintings such as the Paul Cézanne "Card Players" were lent by Stephen Clark, and other notable collectors such as John Hay Whitney, Averell Harriman and Charles S. Payson were generous in their loans, numerous less well-known collectors provided pictures unfamiliar to the general public.

The Cloisters of the Metropolitan Museum of Art, greatest collection of mediaeval art in the U.S., exhibited 40 new additions to its already rich store of objects. Notable among these was the reliquary of St. Stephen from the Meuse valley in Belgium, dated about 1220, and the bust of a bishop, dated 1438, intended to receive the relics of St. Lawrence. This was discovered tarnished and forgotten in a London antique shop.

An exhibition of 600 pieces of early Philadelphia silver was featured at the Philadelphia Museum of Art, while the Minneapolis Institute of Arts showed two centuries of English and American silver.

The University Museum of the University of Pennsylvania, Philadelphia, organized a comprehensive exhibition of African tribal sculpture, selected entirely for aesthetic value and bringing out the ever-increasing appreciation of the arts of primitive peoples.

"Visionaries and Dreamers" was the title of an unusual exhibition at the Corcoran Gallery of Art in Washington. This side of 19th-century art is largely remembered through the work of Odilon Redon, but the exhibition featured not only Redon but also P. C. Puvis de Chavannes and Gustave Moreau.

The John Herron Art museum, Indianapolis, Ind., in honour of the gift of three paintings by Joseph M. Turner and a set of his *Liber Studiorum*, arranged an important Turner exhibition including oils, water colours and drawings. Well received by an enthusiastic audience, the exhibition proved timely, for Turner's influence on later 19th-century painting was being increasingly recognized.

In honour of the centenary of John Singer Sargent's birth, the Museum of Fine Arts in Boston arranged "Sargent's Boston," a nostalgic showing of the numerous portraits as well as designs for murals which he did in the Boston area.

A. W. Bouguereau, the great figure in 19th-century French salon art, was given an exhibition at the University of Southern California at Los Angeles. Long ago discarded as a painter of ponderous, cold, academic subjects, his revival was felt to be of value to contemporary students in revealing his skill as a draughtsman.

A survey of the architect Louis Sullivan, honouring the centenary of his birth, was organized by the Art Institute of Chicago. Effectively arranged with large blow-up photographs, mostly taken by John Szarkowski, and original drawings and examples of ironwork, the exhibition showed dramatically the work of Chicago's early modern architect.

Probably the most spectacular as well as the most popular exhibition of the 1956 season was a full-scale showing of the work of Henri de Toulouse-Lautrec (1864-1901), the joint effort of the Philadelphia museum and the Art Institute of Chicago. Composed of paintings, posters, drawings and lithographs, the group was greatly enlivened by numerous loans from the Musée d'Albi in France never seen before in the United States.

Perhaps the most exquisitely displayed exhibition of the season was the comprehensive one-man showing of the sculpture of Constantin Brancusi at the Solomon R. Guggenheim museum. His work, either primitivelike in wood or in exquisitely polished stone or metal, is most simplified, the very essence of sculptural forms. Rumanian-born but long resident in Paris, Brancusi caused a sensation with his egglike sculptures in the Armory show of 1913.

The Museum of Modern Art exhibited the welded metal sculpture of Julio Gonzales, the Spanish artist who died in 1942. Having learned to weld metal in the Renault factory during World War I, he turned to welded sculpture and was virtually the founder of this art form. The Modern museum combined with the Minneapolis Institute of Arts in an exhibition of prints by the German artists Ernst Kirchner and Emil Nolde. The Museum of Modern Art showed "Masters of British Painting, 1800-1950," from the landscape revolt led by Turner and Constable, the literary pre-Raphaelites, down to the modern abstract movement led by Ben Nicholson and Graham Sutherland.

The Whitney Museum of American Art during the course of the season held one-man showings of the work of three distinguished contemporary U.S. artists. One was a retrospective of the water colours of Charles Burchfield, whose romantic concepts, large in scale, have made water colour into a monumental medium; another was Morris Graves, the sensitive painter and gifted draughtsman from the northwest whose eerie shore birds are ever-compelling; and the third, the most dramatic and exciting, was the sculpture and drawings of Theodore Roszak.

A new exhibition, "Caribbean International," was inaugurated by the Museum of Fine Arts of Houston, Tex., sponsored by Brown and Root, Inc. It included artists from the five Gulf states and Central-American countries. The exhibition went on tour to Dallas, Tex.; Pittsburgh, Pa.; Utica, N.Y.; and Boston, Mass.

GERMAN WOODCARVING, a polychrome and gilded 15th-century statue of one of the "Three Kings from Lichtenthal"; an example of German art, 14th-20th centuries, on display at the Metropolitan Museum of Art, New York city, in 1956

The United States was represented in the 28th Venice Biennale by "American Artists Paint the City," 46 paintings selected by the Art Institute of Chicago, composed of canvases of both fact and symbol by such diversified artists as John Marin, Edward Hopper, Stuart Davis and Jackson Pollock.

The Tate gallery in London showed "Modern Art in the United States," sent by the Museum of Modern Art and composed of paintings by Jackson Pollock, Willem de Kooning, Mark Rothko, Franz Kline and other abstractionists. Although described in the *Times* of London as "Yankee Doodles," the effect of the showing on Europe was strong. (F. A. Sw.)

Great Britain and Europe.—During 1956 the Royal academy in London continued its admirable series of winter exhibitions. As an accompaniment to a unique presentation of Portuguese art which had opened at the end of 1955, one wing of Burlington house was devoted to an intriguing display of English 18th-century furniture, pictures, marbles, tapestries, porcelain and plate. In marked contrast with the mannered elegance of these pieces, the Tate gallery, in conjunction with the Arts Council of Great Britain, provided a first opportunity of seeing a comprehensive cross section of modern United States art.

The Institute of Contemporary Arts presented "Ten Years of English Landscape Painting, 1945-55," which contained a preponderance of pictures by the new generation of artists. In a show of variable quality, Peter Lanyon, Patrick George, John Bratby and Phillip Sutton were outstanding. Frank Auerbach, at the Beaux-Arts gallery (in his first one-man show), and Peter Coker at the Zwemmer gallery were impressive. At the Marlborough gallery, among works by several young painters of diverse nationalities all working in Paris, René Aberlenc showed pictures of considerable merit and interest.

Meanwhile, in Brussels, the Palais des Beaux-Arts staged a large retrospective exhibition of Joan Miro's work. In Germany the masterpieces of the Pinakothek museum of Dresden were on view after ten years' exile in the U.S.S.R. This magnificent collection, made by the princes of Saxony during the 18th century, included Raphael's "Sistine Madonna" and many other of the greatest examples of European painting.

In Paris early in 1956 the Musée Galliera devoted its new rooms to a highly successful exhibition entitled "Poétique de la Nature." It was the first exhibition by a new group, two painters (Roger Chapelin-Midy and Yves Brayer), a sculptor (Louis Leygue), an engraver (André Parinaud) and a designer (Jean Picart le Doux). In February two simultaneous exhibitions by Bernard Buffet were to be seen at the Galerie Drouant-David and the Galerie Visconti. After his preoccupation in 1955 with the horrors of war, Buffet had turned his attention to circuses, sad circuses, seen from the point of view of the performers. Other Parisian exhibitions of interest and importance, held in the first months of the year, were paintings of the nude by Othon Friesz at the Galerie Montmorency, 42 canvases by Chaim Soutine at La Maison de la Pensée Française, and large retrospectives dedicated to the work of Maurice de Vlaminck and Nicolas de Stael at the Galerie Charpentier and the Musée National d'Art Moderne, respectively.

In May the Royal academy opened a more progressive summer exhibition than usual, and the Tate gallery, in conjunction with the director of the Hamburg Kunsthalle, presented "A Hundred Years of German Painting, 1850-1950."

At the Royal Watercolour society's galleries an imposing exhibition of large canvases by Paul Rebeyrolle was staged by Marlborough Fine Art, Ltd.

The year 1956 was the 350th anniversary of Rembrandt's birth at Leyden. In Berlin, at a new museum at Dahlem in the western suburbs, 26 paintings, 144 drawings and 249 etchings were shown in an exhibition which not only marked the artist's anniversary

"BAR AND GRILL" by Morton Roberts, awarded the Benjamin Altman figure painting prize at the 1956 exhibition of the National Academy of Design, New York city

but the return to Berlin of some of its scattered treasures. Special displays of Rembrandt's etchings and drawings were on view at the print room of the British Museum and in the Galerie Mansart of the Bibliothèque Nationale in Paris. At the Rijksmuseum at Amsterdam there was a wonderful loan exhibition drawn not only from Dutch sources but from many countries of three continents. The arrangement of the 101 pictures covered the whole span of Rembrandt's active life from 1626 until 1669. Concurrently, the Boymans museum at Rotterdam showed a splendid collection of 260 drawings.

A record number of 34 nations took part in the 28th Venice Biennale. After an absence of 22 years the U.S.S.R. displayed the development of Soviet art since 1934. Participating Asian countries included India, Vietnam and Japan. For the first time Turkey, Iran and Ceylon sent exhibits. Retrospective shows were devoted to the works of Eugène Delacroix, Pieter Mondriaan and Juan Gris. The major prize for painting went to Jacques Villon, for sculpture to Lynn Chadwick.

In London during July and August a unique preview of six of the ten stained glass windows for Coventry cathedral was arranged at the Victoria and Albert museum. At the Tate gallery an exhibition of the creations of Wyndham Lewis' vorticist world preceded a small and choice collection of Cubist paintings lent by the Musée National d'Art Moderne.

The Festival exhibition at Edinburgh, the fifth to be devoted to a French painter, was a sumptuous collection of more than 80 paintings by Georges Braque.

Other autumnal exhibitions in Europe included paintings, sculpture and pottery by Marc Chagall at the Basle Kunsthalle, paintings and drawings by the Caracci at the Archiginnasio at Bologna, paintings, water colours and pastels by Georges Rouault at the Palais de la Berbie at Albi and, in commemoration of the 150th anniversary of his death, drawings and paintings by Fragonard at the Musée des Beaux-Arts at Besançon.

Art Sales. During 1956 the Parke-Bernet galleries in New York city, America's leading auction house, grossed \$5,567,538 in 82 sales, exceeding the previous season by more than \$100,000. The three top sales were the Oliver B. James collection of modern paintings (\$207,175); Baron Cassel van

Doorn's collection of French 18th-century furniture, painting and sculpture (\$271,175); and 18th-century English furniture, paintings and objects of art from a New York mansion (\$287,062). Although prices continued to rise, they were not so high as in the Paris and London auctions. Parke-Bernet's top price for a painting was \$37,000 for a "Bouquet of Flowers" by Vincent van Gogh; next came "Petite Danseuse," a bronze by Edgar Degas at \$30,000, and two Paul Gauguins at \$24,000 and \$25,000, respectively. Prices for old masters were less—\$13,000 for George Romney's "Marchioness Townsend"; \$12,000 for Sir Joshua Reynolds' "Richard Barwell and Son"; and \$19,000 for a pair of Canalettos.

In 74 sales during the season, total sales of the Plaza Art galleries of New York city amounted to \$1,862,550. Major sales were the estates of Helen Fahnestock Hubbard, Countess de Kotzebue and Helen Medham. In two sales the Metropolitan Museum of Art sold a quantity of paintings and other objects of secondary importance which brought \$179,795. An unusual sale was a group of cigar store Indians and other trade signs from the Haffenreffer collection which totalled \$54,700.

In London the top auction price was obtained at Sotheby's, \$81,200 for Nicolas Poussin's "Nativity" from the collection of Jocelyn Beauchamp of Langley park, Norwich, and at one time in the collection of Sir Joshua Reynolds. A Hendrick Avercamp, "Winter Landscape With Gentlemen Playing Kolf on a Frozen River," was sold for \$39,000, and Rembrandt's "Portrait of the Artist's Sister" brought \$46,200. At Christie's a record price of \$48,800 was paid for a pair of *capricci* by Francesco Guardi. Christie and Sotheby together did a 1956 season's business of approximately \$12,600,000.

Nearly all art objects had risen in price, with the result that auction sale totals were on the increase, despite the fact that paintings of spectacular quality had become a rarity on the market. Many of the greatest collections had already been broken up and their greatest treasures for the most part had found their way to museums. Smaller collectors made up the bulk of the contemporary buying public. Great price increases were noted in certain comparatively modern pieces such as objects by Faergé; a Siberian jade chimpanzee brought a record \$14,000. Manuscripts of books also brought record prices, such as Somerset Maugham's *The Moon and Sixpence* (\$7,280) and George Bernard Shaw's *John Bull's Other Island* (\$7,840).

In Paris a group of Cézanne oils and water colours was sold at the Galerie Charpentier. A Cézanne water colour, "The Bath," brought \$6,000, while the three highest-priced oil paintings were "Five Bathers," \$54,571, "Jas de Bouffan," \$46,000, and "Louveiennes," \$35,714. Other high prices in the same sale were a Degas ballet scene which sold for \$64,285; Auguste Renoir's "Young Woman With Trimmed Hat," \$54,571; Gauguin's "Peasant With Dog," \$52,857; and Henri de Toulouse Lautrec's "Tommy, Cocker Spaniel," \$28,571. Asbestos. Based on U.S. bureau of mines data, Table I gives the world production of asbestos, including details by leading countries, and Table II gives data on the U.S. situation.

United States.—The United States produces less than 5% but consumes almost 50% of the world production of asbestos. The main commercial variety of asbestos is chrysotile, produced chiefly by Canada which supplies the U.S. with most of its large requirements. Arizona is the only domestic source of low-iron chrysotile asbestos fibres for electric cable coverings.

Canada.—Six companies produced 1,058,937 tons of asbestos ore in 1955. Of this total, the world's largest asbestos producer

Astronomy. The year 1956 saw the publication of some important astronomical discoveries, the most exciting of these pertaining to developments in the borderline between astronomy and high-energy nuclear physics. Progress in both the theoretical and observational phases of the subject was impressive.

Instrumentation.—The new Flower and Cook observatory at the University of Pennsylvania was dedicated with a symposium devoted to the use of relatively small instruments in astronomy. The Lick observatory's 120-in. reflector neared completion, while the Russians reported building a telescope of similar size in the Crimea. The National Science foundation (U.S.) made a grant of \$279,000 for site testing in Arizona and California for a national optical observatory.

Two new radiotelescopes devoted primarily to 21 cm.-line researches were put into operation. The 60-ft. Harvard telescope was dedicated April 28, while a 25-m. dish had been constructed at Dwingelo, 30 mi. S. of Groningen, Neth.

Much planning had been done for Operation "Moonwatch," the program for the tracking of artificial satellites to be launched during the International Geophysical year, 1957–58.

The Sun.—As the solar cycle advances, the sun shows an increasing level of activity. W. A. Rense at the University of Colorado, Boulder, photographed the solar disk in Lyman α from an Aerobee rocket; a considerably enhanced Lyman α radiation occurs in active spot and plage areas at the time of flight. High-dispersion solar spectrograms obtained at the McMath-Hulbert observatory show complex structure in all but the weakest Fraunhofer lines. They provide a powerful tool for the study of the hydrodynamics of the solar atmosphere and allow an interpretation of spectroheliograms. This problem, however, requires much higher resolution than is available. A new model of the internal structure of the sun calculated by M. Schwarzschild,

R. Howard and R. Härm takes into account the depletion of hydrogen in the solar interior by its conversion to helium. A new analysis of the quantitative chemical composition of the solar atmosphere was undertaken at the University of Michigan, Ann Arbor, by L. Goldberg, E. Müller and L. H. Aller. The solar chemical composition appears to be more nearly representative of our part of the universe than that of the earth's crust or meteorites.

Meteors.—An analysis by F. L. Whipple and L. Jacchia of the accurate orbits of 308 meteors photographed with the super Schmidts showed all these objects to belong to the solar system. More than 90% of them originated from comets.

Venus.—Radio-frequency radiation of thermal origin was observed by C. H. Mayer, R. M. Sloanaker and T. P. McCullough at the Naval Research laboratory. The strata responsible for this radiation must be at a higher temperature than 350° K. J. D. Kraus at Ohio State university, Columbus, observed intense 11 m.-wave-length signals of burstlike nature similar to terrestrial thunderstorm static and also signals of a more sustained and coherent type. The hypothesis of water on Venus, invoked to explain the scattering properties of the cloud particles, was regarded as untenable. It does not explain the colour of the clouds, nor can it seem to account for the absence of water vapour lines in the spectrum of the planet.

Earth's Rotation.—The U.S. Naval observatory initiated a program of comparing the second as defined by the earth's period of rotation with an atomic frequency standard developed by L. Essen and J. V. L. Parry at the National Physical laboratory, Teddington, Eng. It was believed that a change of one part in 10^9 per year in gravitational and atomic time scales relative to each other might be detected by about 1970.

Mars.—In the press the most exciting astronomical event of the year was the close approach of Mars in September. The vast observational material accumulated at this opposition had not yet been described and analyzed late in the year, but systematic watches of the planet from stations widely separated in longitude were maintained. Since the rotation period of Mars is 24 hr. 37 min., a single terrestrial station cannot maintain a survey of the entire planet.

A new interpretation of the dark areas on Mars, proposed by D. B. McLaughlin, explains their shapes as due to deposition patterns of volcanic ash dispersed by monsoon winds. This theory, although it does not adequately explain the changes of colour with the seasons, and seems to indicate that more water should be found on the surface of the planet than actually exists there, explains a number of previously puzzling mysteries of the red planet. The dark areas of Mars with their long-term changes can no longer be held up as "proofs" of vegetation on Mars. The volcanic theory neither supports nor opposes the hypothesis of life on Mars; it does permit an explanation of the dark areas by inorganic causes. Thermal radio-frequency radiation had been observed from Mars.

Pluto.—The suggestion that Pluto is an escaped satellite of Neptune had been made 20 years earlier by Raymond A. Lyttleton in volume 97 (page 108) of the *Monthly Notices* of the Royal Astronomical society. The hypothesis was greatly strengthened by the recent work of Gerard P. Kuiper, who showed how such an escape could occur in the framework of his theory of the origin of the solar system. Thanks to the work of Kuiper, we now have some reasonable ideas on the origin of the solar system, and it is quite evident that Pluto could not have been formed in the same way as Neptune or Uranus.

Crab Nebula.—This strong radio-frequency source, identified with a supernova of 1054, had defied any interpretation in terms of simple thermal radiation. Oort and Walraven published an account of the polarization of the optical radiation from this

object, suggesting that the emission is a synchrotron-type of radiation produced only by high-energy particles in a magnetic field. The possibility that other nonthermal radio sources may owe their radiation to synchrotron emission was being explored.

Red Shift.—At the Naval Research laboratory, A. E. Lilley and E. F. McClain measured the radio-frequency red shift of the 21-cm. absorption line produced in the envelope of neutral hydrogen gas surrounding the high-temperature colliding-galaxy radio source Cygnus A. They showed that to within the limits imposed by the experiment, $\Delta\lambda/\lambda$ is constant over an interval of 500,000 to 1 in the electromagnetic spectrum.

The red shifts of distant galaxies have been determined usually by spectrographic methods. W. A. Baum showed that with a photon counter and a six-colour system it is possible to reach much fainter galaxies. Since the intrinsic energy distributions of the galaxies are independent of their distance, from a change in their observed colour it is possible to get an estimate of the red shift.

Stellar Evolution.—Perhaps the most exciting developments in astronomy are those connected with problems of stellar evolution. Merle F. Walker studied the colour magnitude diagrams of several clusters, finding additional evidence bearing on the problem of star formation. For example, the cluster NGC 6530 possesses a normal main sequence down to about AO; the fainter stars lie above the main sequence. Presumably, they are stars that are yet shining by gravitational contraction and have not yet reached the main sequence. Such clusters contain numbers of T Tauri variables that are presumed to be young stars still in a contracting state. In NGC 2264, stars of spectral classes later than about F8 show an increasing degree of rotation with advancing spectral class, suggesting that these stars are objects in which the original angular momentum of the cloud from which they are formed has not yet been dissipated.

A. J. Deutsch discussed stars at the other end of the life span. The extended atmospheres of M giants, as illustrated convincingly by the displacements of spectral lines in the system of α Herculis, appear to be slowly dissipating into space. This observation is in harmony with theoretical expectations. Some of the main steps in the life history of a star appear to be understood. A star is formed from the interstellar medium, pulls itself together and shines by gravitational contraction until it reaches the main sequence where it shines for the longest part of its productive life by converting hydrogen into helium. Then, after the hydrogen in its core has become exhausted, energy production takes place in a thin shell where hydrogen-rich material is still fed in from the outer parts of the star. The core of the star grows gradually smaller and denser, the outer portions expand until, finally, they are dissipated in space. Thus the star leaves the main sequence and becomes a giant. Eventually, the hot core of the star settles down as a white dwarf; the details of this transition are not yet known, either observationally or theoretically.

Closely connected with the problem of stellar evolution is that of the origin of the elements. In one theory the elements were all presumed to have been formed early in the history of the universe. In another, the heavy elements are presumed to have been formed in the intensely hot cores of aging stars. Important contributions to this problem were made by A. G. W. Cameron (Chalk River, Ont.), the Burbidges, F. Hoyle and W. Fowler working at the Cavendish laboratory in Cambridge, Eng., and at California Institute of Technology. They were able to show that on the assumption the nuclides were produced in hot stellar cores it was possible not only to account for the relative distribution of the various metals in the neighbourhood of iron but their relative isotope abundances as well! The heavier nuclides can be accounted for by neutron capture on a slow time scale, by neutron capture on a fast time scale and by photo-

nuclear reactions on the products of the slow neutron time scale.

Atomic Energy. The military and the peaceful uses of atomic energy continued their unequal contest for supremacy in 1956. Among the great nuclear powers atoms for war continued to claim a greater share of national treasure than was allotted to atoms for peace. International disarmament made no discernible progress, although the world's rulers agreed that all-out nuclear war would be a catastrophe for the whole race of man. Tests of atomic weapons, both large and small, continued at an increased rate.

But atoms for peace made some notable gains. The long-sought international atomic energy agency was nearing reality, and international co-operation for peacetime exploitation of the atom was developing rapidly.

In May the world's first large nuclear power plant "went critical" in Great Britain. Asia's first atomic reactor began operating in India on Aug. 4, producing radioactive isotopes for research. More and more of the smaller nations were undertaking nuclear research and laying the foundations for peacetime atomic energy industries.

Scientific reports on the effect of atomic radiation on life helped to bring into perspective what is known of this little understood phenomenon and to point out what man must learn and do in order to live with atomic energy.

Atomic Disarmament.—The high hopes born of the conference of the heads of the Big Four Powers at Geneva, Switz., in July 1955 were still unrealized. The U.S.S.R. rejected Pres. Dwight D. Eisenhower's proposal for exchange of military blueprints and international aerial inspection. A five-nation United Nations disarmament subcommittee met in London from March 19 to May 4, 1956, without reaching agreement on a disarmament formula. The UN disarmament commission began a new session in New York on July 2 but adjourned July 16 without resolving the stalemate.

On Sept. 11, 1956, Soviet Premier Nikolai A. Bulganin again put forward the Russian proposal for an unpoliced ban on nuclear weapons tests which was first offered to the world after the giant Soviet thermonuclear explosion of Nov. 1955. But the west's attitude toward the Soviet proposal had been summed up by U.S. Secretary of State John Foster Dulles on Jan. 11 when he said that a sure disarmament plan must be found before such tests could be safely halted. By the end of 1956 no such "sure" plan appeared to be in sight. (See also UNITED NATIONS.)

U.S. Nuclear Tests.—The United States in May, June and July 1956 carried out the biggest test program ever staged at its Eniwetok-Bikini proving ground in the mid-Pacific. No official announcement was made of the total number of explosions, but Japanese scientists recorded ten. The first two, on May 5 and May 21, were witnessed by 15 U.S. newsmen and 17 civil defense officials. The May 5 shot was a "small" device in the kiloton power range. Reporters got the impression, not officially confirmed, that it was a "pygmy H-bomb" equivalent in power to more than 30,000 tons of T.N.T.

The May 21 test was the first U.S. air drop of an H-bomb. The weapon was dropped by a B-52 intercontinental bomber and detonated at an estimated height of 10,000–15,000 ft. Its power, never officially announced, was guessed at about 10,000,000 tons' T.N.T. equivalent. It missed its aiming point over Namu

Island by nearly four miles, but officials ruled the experiment a success.

The U.S. Atomic Energy commission and the department of defense said the 1956 tests helped to develop new defenses against nuclear attack and pointed the way toward perfection of nuclear weapons with "reduced" radioactive fallout.

Assuming ten shots in the 1956 program, the all-time total number of U.S. nuclear explosions now stood at at least 75.

Soviet Tests.—The Russians, after a big test year in 1955, resumed the testing of nuclear weapons in March 1956. They started a new series in April and another in August. The U.S. for the first time reported the general location of the Russian proving grounds. It said the explosions took place at the "usual" site "in southwest Siberia, north of India, Afghanistan and Pakistan, and west of China," and that the Russians also had used "the area of the Barents sea" for nuclear tests.

The first three shots of the series started in August were each less than a megaton (1,000,000 tons' T.N.T. equivalent), according to the U.S. Atomic Energy commission. The Soviet government reported a fourth explosion Sept. 10. It said the new tests were designed to develop tactical atomic weapons "for various kinds of troops." It also said that to reduce fallout Soviet tests usually are carried out "at great heights" with "a minimum quantity of radioactive substances."

British Tests.—Great Britain test-fired two atomic devices in the Monte Bello Islands off Australia, one on May 16, 1956, and another on June 19. This was the third British test series, the first and second having been conducted in 1952 and 1953. It brought the total of British test explosions to five. Then on Sept. 27 the British began a fourth series with an experimental explosion at the Maralinga proving ground in Australia. Four shots in all were scheduled for this series. All the British tests had been of atomic weapons in the kiloton power range. Britain scheduled its first H-bomb test for early 1957 near Christmas Island in the mid-Pacific.

Radiation and Health.—In Washington, D.C., the National Academy of Sciences after a year-long study reported that radiation from any source "is harmful to life." But "with proper safeguards . . . a full-scale, world-wide peaceful atomic energy program should not bring with it undue biological hazards."

The report proposed that records be kept of every person's lifetime exposure to radiation and recommended limits on the amount of radiation reaching the reproductive glands over and above the amounts from natural sources. The limits were: For the whole population, an average of 10 roentgens from conception to age 30; for any individual, no more than 50 roentgens to age 30 and an additional 50 roentgens between the ages of 30 and 40.

The academy said that at present the average U.S. citizen receives in his sex glands about three roentgens in medical and dental X-rays—about 30% of the recommended limit. The report further said that nuclear weapons tests had not raised world-wide radiation to biologically dangerous levels "and will not do so if continued at the same rate as in the past."

The academy noted that when a world-wide atomic power industry becomes fully developed its radioactive wastes may "represent more radiation than would be released in an atomic war." Therefore, means must be found to keep such wastes from doing harm.

The Medical Research council of Great Britain published similar findings at the same time. Both reports expressed concern about radioactive strontium-90, a long-lived fission product which settles uniformly on the planet in a period of years after high-yield nuclear explosions. Ingested in large enough amounts it can cause bone cancer in human beings.

International Agency.—Twelve nations meeting in Washington, D.C., from February through April 1956 reached substantial

agreement on the draft statute for an international atomic energy agency to promote atoms for peace. Such an agency was first proposed by President Eisenhower in a speech to the United Nations on Dec. 8, 1953.

The 12-nation group invited a total of 87 countries to a conference starting Sept. 20, 1956, in New York city, to work out the final text of the statute.

The agency would function as bank and broker for fissionable materials. Such materials, contributed by the atomic "have" powers, would be distributed to "have-not" nations. The draft statute called for "prudent safeguards" to make certain that all atomic materials were used solely for peaceful development of atomic energy.

The New York conference got under way with 81 of the 87 nations represented, and the debate immediately centred on the inspection safeguards demanded by the United States. The U.S.S.R., India and many of the smaller nations contended that the proposed inspection and control provisions would violate the sovereignty of recipient countries.

The United States argued that the safeguards were vital to the peaceful use of atomic energy. It offered, if the international agency adopted them, to apply the inspection-control provisions to the bilateral atomic agreements (grown to 39 by the time of the conference) it had signed with other nations for peaceful use of atomic energy.

Ambassador James J. Wadsworth, affirming U.S. willingness to entrust inspection to the United Nations agency, said the United States wanted the international body to be "the cornerstone of its international activities in the field of atomic energy for peace." Chief supporters of the U.S. view were Great Britain, Canada, Australia and New Zealand.

On Oct. 23 the representatives of all the states present at the conference (82 by this time) voted unanimously to adopt the revised statute for the International Atomic Energy agency. It was hoped that enough nations, a minimum of 18, would ratify the statute to bring it into force by mid-1957.

Other International Co-operation.—President Eisenhower on Feb. 22, 1956, allocated 40,000 kg. (88,000 lb.) of uranium-235 for fuelling research and power reactors at home and abroad. Half was earmarked for distribution among "friendly nations" and half for use chiefly in private power plants in the United States, on a sale or lease basis.

The 40,000 kg. of U²³⁵, worth approximately \$1,000,000,000, would support nuclear power programs with a generating capacity of several million kilowatts. Not all would be distributed in any one year but as needed over the years. This allocation was intended to assure fuel to support atomic power development during the life of civilian licences granted by the Atomic Energy commission in the United States and during the expected life of foreign power projects using U.S. fuel.

In July the U.S. congress appropriated \$5,500,000 to help start construction of research reactors in 25 other countries. Each country would receive a maximum of \$350,000, representing about half the cost of a research reactor. The first grants went to Brazil, Spain, Denmark and the Netherlands.

Bilateral Agreements.—U.S. offers of help, including the allocation of fuel, stimulated bilateral research and power agreements with other countries. By June 30, 1956, the United States had signed 29 research and 7 power agreements. It also was negotiating power agreements with Brazil, India, Italy and Norway and additional research bilateral agreements with Ceylon, Ecuador, Guatemala, Haiti, the Union of South Africa and Yugoslavia.

The United States amended agreements with its World War II atomic partners, Great Britain and Canada, to broaden exchange of both classified and unclassified information on such

things as military package power reactors and atomic propulsion of naval vessels, aircraft, "or land vehicles for military purposes." By June 30 the United States had presented atomic libraries to 42 nations and three international organizations. U.S. business firms had been picked to build nine reactors in other countries.

Regional Atomic Groups.—Ministers of the Organization for European Economic Cooperation set up a steering committee in Paris in July to discuss nuclear co-operation. The United States and Canada were associate members.

Meanwhile the six Euratom countries, Belgium, France, west Germany, Italy, Luxembourg and the Netherlands, worked on a treaty providing for an atomic development pool program. The French national assembly on July 11 approved in principle the proposed pool of atomic resources in Euratom but reserved France's right to develop nuclear weapons. On July 13 the Soviet Union, objecting to the inclusion of west Germany in Euratom, proposed as a substitute an all-European regional body for exchange of information and co-ordination of atomic development programs. The U.S.S.R. and the United States would be members.

The European Organization for Nuclear Research (C.E.R.N.) issued its first annual report on June 1. It conducted an international symposium on high-energy physics in Geneva, June 11-23. Approximately 300 scientists attended, including about 60 from the U.S. and the same number from the U.S.S.R.

In July at Panamá City President Eisenhower proposed a western hemisphere organization to speed "beneficial use of nuclear forces" in industry and medicine. In March 1956 the Republic of the Philippines was chosen as the site for an Asian nuclear training and research centre to be financed by the United States in behalf of the Colombo powers. Canada was providing a reactor under the Colombo plan which was to begin operating by 1958 at Trombay Island, 13 mi. from Bombay. Meanwhile, India's first atomic reactor went into operation at Trombay on Aug. 4. It would produce radioactive isotopes for research and would be used to train nuclear scientists.

Nuclear Power (British).—On May 22, 1956, the world's first large-scale atomic power plant "went critical"—that is, a self-sustaining nuclear chain reaction began in the plant's uranium "firebox." The plant was Britain's Calder Hall station in Cumberland. Subsequent to its formal opening by Queen Elizabeth II on Oct. 17 the two-reactor plant was expected to achieve a capacity of 92,000 kw.

The United Kingdom Atomic Energy authority reported that as of March 31, 1956, "no fewer than 21 nuclear reactors were either in operation, under construction or planned by the Authority alone." These were in addition to the 12 nuclear power stations (including Calder Hall) embraced in the British government's ten-year program and in addition to a research reactor to be built by a private firm, Associated Electrical Industries.

Nuclear Power (Russian).—The Soviet Union in 1956 announced plans to build five atomic power plants, in Moscow, Leningrad and the Urals. They would range in capacity from 400,000 to 600,000 kw. each and were expected to be in operation by 1960. The U.S.S.R. planned in addition to have several pilot plants of 50,000-kw. capacity each in operation by 1959 or 1960, and was also reported to be planning a 200,000-kw. pilot plant.

Nuclear Power (French, Japanese, German).—A French reactor at Marcoule, north of Avignon, began to produce enough heat to make steam on Sept. 28, 1956. When it reached full power this reactor was expected to generate about 5,000 kw. of electricity, or less than enough to drive its own cooling blowers. The reactor was the first of three to be built at Marcoule. They were designed primarily as plutonium producers. Production of atomic power on an industrial scale was not expected in France before 1959, when a plant in the Loire valley was scheduled for completion. It was designed to have a capacity of 300,000 kw.

NUCLEAR TEST PLANE, a Convair NB-36H, the first aircraft to fly with an operating atomic reactor aboard. Test trials were conducted in 1956. The reactor was not used to power the plane

Atsushi Ohya, vice-chairman of the Japanese Atomic Industrial forum, said on Sept. 27 that his country hoped to be generating nuclear power by 1965. Ohya said Japan was lagging in atomic technology, but by 1965, he said, "we shall require atomic power of at least 450 megawatts," and the requirement by 1970 would be 2,800 megawatts.

West Germany hoped to have 20 nuclear power plants in operation by 1970, an ambitious program, but Franz Joseph Strauss, in charge of the republic's atomic affairs, believed it could be carried out. The goal was 3,000,000 kw. of atom-generated electrical power. Meanwhile, the U.S.S.R. promised to help east Germany to build a 100,000-kw. atomic power station.

Nuclear Power (U.S.).—The first U.S. atomic industrial power plant, the 60,000-kw. plant at Shippingport, Pa., was expected to be generating power by late 1957. Meanwhile, the AEC pushed work on nine reactors of different design as developmental power prototypes. It put into effect nine basic regulations governing civilian applications of atomic energy. It also, on May 4, granted the first construction permits for private power reactors. The permits went to Consolidated Edison company of New York for a \$55,000,000 plant at Indian Point, Peekskill, N.Y., to generate 236,000 kw., and to Commonwealth Edison company of Chicago for a \$45,000,000 plant in Grundy county, Ill., to generate 180,000 kw. Both were scheduled for completion by Oct. 1960. They would be financed entirely by private capital.

In addition, under its Power Reactor Demonstration program, the AEC signed its first contract with an industrial group proposing to build a large power plant with government assistance. The group was the Yankee Atomic Electric company of Boston, which planned a 134,000-kw. plant near Rowe, Mass. The company would pay the \$34,500,000 construction costs and the commission would pay \$5,000,000 research and development costs.

On Aug. 4 the commission granted a "conditional construction permit" for another large plant under the demonstration program. It went to the Power Reactor Development Corp. of Detroit, a nonprofit organization supported by 26 utility and manufacturing corporations, for a 100,000-kw. fast-breeder plant at Lagoona Beach, Monroe county, Mich. The reactor was expected to cost \$10,500,000 and was scheduled for completion between Dec. 15, 1959, and Dec. 15, 1960.

Alaska Reactor.—The Atomic Energy commission in August approved "as a basis for contract negotiations" a proposal by the

Chugach Electric association of Anchorage, Alaska, and the Nuclear Development Corporation of America to develop a 10,000-kw. demonstration nuclear power plant which would be built near Anchorage. The plant's total cost would be about \$20,000,000, of which the AEC would be asked to furnish \$18,325,000. The reactor would be the first combining heavy water, the best moderator, with liquid sodium, the best coolant. The AEC's approval, first of its kind, was for "limited initial design and development work."

The Chugach proposal was the third on which the AEC had acted under the second round of its Power Reactor Demonstration program promulgated in Sept. 1955. Seven proposals were received under the second round program. The other two approved as a basis of negotiation were proposals of the Rural Co-operative Power association of Elk River, Minn., for a 22,000-kw. boiling water reactor, and of the Wolverine Electric co-operative of Big Rapids, Mich., for a 5,000-10,000-kw. aqueous homogeneous reactor.

Raw Materials.—In the first half of 1956 the United States became the free world's largest producer of uranium—nearly 3,000,000 tons of ore a year, with reserves of more than 30,000,000 tons. The AEC announced that when its present ore-buying program ended in 1962 it would provide a guaranteed market to 1966 for uranium oxide in concentrates. It would pay \$8 a pound for the oxide.

Atomic Aeroplane.—Chairman Lewis L. Strauss of the U.S. Atomic Energy commission disclosed on June 13 that "in January a turbojet (aircraft) engine was for the first time powered exclusively by heat from an experimental reactor operating on the ground at our testing station in Idaho." The AEC earmarked \$99,000,000 in fiscal 1957 for aircraft propulsion work, and the Civil Aeronautics administration forecast that civil aircraft manufacturers would have atomic power plants on their drawing boards "by 1965."

Atomic-Powered Ships.—The Bethlehem Steel company's shipyard at Quincy, Mass., began work in July on an \$88,000,000 nuclear-powered guided missile cruiser. Westinghouse Electric corporation was to build the \$18,300,000 atomic power plant. Rear Adm. Albert G. Mumma, chief of the navy's bureau of ships, said that "by the early 1960s all major combatant naval vessels

CALDER HALL, Great Britain's first atomic power plant and the largest in the world, opened at Cumberland, Eng., in Oct. 1956. The two generating units were expected to produce 92,000 kw. of electricity when the plant was in full operation

authorized for construction are likely to be propelled by nuclear power."

Meanwhile, the atomic submarine "Nautilus" in the 18 months since she put to sea for the first time in Jan. 17, 1955, had logged nearly 50,000 mi. on her original fuel charge. The first fuel core was expected to be good for at least six months more.

President Eisenhower on July 30, 1956, signed a congressional measure authorizing construction of the first U.S. atom-powered merchant ship. It was expected to cost about \$40,000,000. On Sept. 25 Undersecretary of Commerce Louis S. Rothschild said the Maritime commission and AEC hoped to have the atom-powered merchant ship in operation before the end of 1959. He said it would be powered by "the most advanced type of pressurized water atomic reactor" and would have a service speed of 21 knots, carry about 100 passengers and have capacity for 12,000 tons of cargo. It was reported that Norway, west Germany and Great Britain were also working on projects for nuclear propulsion of merchant ships.

The U.S.S.R. reported progress toward completion of an atom-powered icebreaker, and was also considering construction of a nuclear-powered whaling ship. The icebreaker was described as a 16,000-ton, 428-ft. craft which would consume no more than five ounces of fuel a day and could operate without refuelling for about three years. Moscow radio said it would be able to break through the heaviest ice and reach the north pole.

Hydrogen Power.—The United States, the Soviet Union and Great Britain continued long-range research in the hope some day of harnessing the H-bomb's fusion reaction for industrial power. None claimed any major breakthroughs. Amasa Bishop, chief of the U.S. project, said in June that with fusion there exists "the possibility of direct generation of electrical power without the necessity of going through a heat cycle, which is both costly and inefficient." This is because much of the energy released in fusion is in the form of charged particles. At the high temperatures involved, of the order of hundreds of millions of degrees, the reaction could be contained only by an electromagnetic field. Interaction of the charged particles with this field could "result in the direct generation of electrical power."

Atoms for Rockets.—The AEC's Los Alamos laboratory revealed Sept. 9, 1956, for the first time that it was engaged in "research and development of nuclear rocket propulsion." In

theory a small fission reactor might be used in a rocket as a substitute for combustion of chemical fuels. The reactor would heat a light gas (preferably hydrogen) which would be expelled at high velocity, thus propelling the rocket in the opposite direction.

Access Permits.—The Atomic Energy commission in June issued 67 "access permits" entitling holders to receive classified atomic information of industrial interest. This brought the total issued under the access permit program to 912. The AEC said it had sold about 11,000 confidential and 2,000 secret reports to permit holders.

The commission also issued rules under which it would provide secret restricted data on fusion processes to persons involved in "substantial" efforts to produce fission power.

Food Irradiation.—The Atomic Energy commission in July 1956 invited bids on a \$3,000,000 food irradiation reactor it would build for the army quartermaster corps. On Sept. 25 the AEC announced that it had received proposals from 11 industrial firms. The quartermaster corps had been conducting experiments to determine whether foods sterilized by radiation would be non-toxic, acceptable to consumers in terms of appearance and taste, and economically competitive with foods preserved by other means. The new reactor, to be moderated with water and powered with solid fuel elements, would provide a large-scale gamma radiation source for the experimental program.

Isotopes.—In the ten years through May 31, 1956, the Atomic Energy commission made 82,688 shipments of radioactive isotopes to industrial, medical and research users. Of this total, 4,334 shipments went to foreign countries. In the United States 1,200 industrial firms were using these so-called tracer materials possessing radioactive "tags." The AEC said annual savings from their industrial use amounted to about \$100,000,000 and would increase tenfold during the next ten years.

Newest Reactor Concept.—The commission disclosed that it had started a program to develop reactors fuelled by a mixture of uranium and plutonium. So far no one had succeeded in safely harnessing the energy of highly poisonous plutonium for nuclear power. The uranium-plutonium project brought to nine the number of experimental power reactor designs on which the AEC was working. The others were pressurized water, boiling water, sodium-graphite, aqueous homogeneous, fast breeder, liquid metal-fuelled, organic-moderated and closed-cycle gas-cooled.

Australia, Commonwealth of. Australia is a realm of the Commonwealth of Nations, situated in the southern hemisphere. Federal capital: Canberra. Areas and populations of the federated states, Northern Territory and Australian Capital Territory are given in the table. Apart from the larger state capitals there was only one city (metropolitan population) of more than 100,000 in 1954: Newcastle, N.S.W., 178,156. Territories under the administration of the Commonwealth of Australia but not included in it comprise Papua and the trust territory of New Guinea (see PAPUA-NEW GUINEA; TRUST TERRITORIES), Norfolk Island (13

sq.mi.; pop. [1954 census] 942), the island trust territory of Nauru (8 sq.mi.; pop. [1954 census] 3,473), Ashmore and Cartier Islands, Heard and Macdonald Islands (159 sq.mi.), Cocos (Keeling) Islands (5 sq.mi., pop. [1955 est.] 1,000) and the Australian antarctic territory (2,472,000 sq.mi.). Language: English. Religion (1954 census): Anglican 3,408,850; Roman Catholic 2,061,986; Methodist 977,933; Presbyterian 869,242; Baptist 127,444; Lutheran 116,178; Church of Christ 80,344; Greek Orthodox 74,760; Congregational 69,452; other Christian 247,485; Jewish 48,439; other non-Christian 6,378; indefinite and no religion 42,140; no reply 855,898. Queen, Elizabeth II; governor general in 1956, Field Marshal Sir William Slim; prime minister, Robert Gordon Menzies.

State or territory	Capital (with metropolitan pop. 1954 census)	Area (in sq.mi.)	Population (1947 census)	(1954 census)
New South Wales	Sydney (1,863,161)	309,433	2,984,838	3,423,529
Victoria	Melbourne (1,524,111)	87,884	2,054,701	2,452,341

Australian Capital Territory	Canberra (28,277)	939‡	16,905	30,315
Totals		2,974,581	7,579,358	8,986,529§

*Including Fremantle. †Including 28 sq.mi. at Jervis Bay (federal port, 90 mi. E.N.E. of Canberra). ‡Excluding full-blooded aborigines: (1947 census) 46,638; but including half-caste (1954 census) 27,179. §1955 est. 9,201,000.

History.—As regards internal politics, 1956 was a quiet year with the Liberal-Country party government supported by a record majority of 27 in the house of representatives. There was still dissension within the Labour party, despite the near elimination in the Dec. 1955 elections of the Catholic Action break-away group, and it did not offer spirited opposition.

In the senate, two Catholic Action or anticommunist labour senators held the balance of power from July 1 when newly elected senators entered parliament. Senate strengths were Liberal-Country party 28; Labour 28; anticommunist Labour 2. The anticommunist senators did not oppose government legislation, but Liberal leaders warned publicly there might be a *rapprochement* between the Labour party and the two break-away senators when a suitable opportunity arose to force an issue in the senate which would bring about a federal general election.

The eclipse of the anticommunist Labour party continued at the polls. Of 14 candidates in the Tasmanian state election in October, 11 lost their deposits. None won a seat. In the federal by-election for Barker the same month, the anticommunist candidate also lost his deposit. Despite continuing dissension within the party, state elections and the Barker by-election later in the year showed a slight swing toward official Labour. In March the New South Wales Labour government had dropped seven seats in the state elections and was returned to power with a narrow majority. A South Australian election the same day returned a Liberal government to power with party strengths unchanged. In April, however, following a federal supplementary budget increasing taxation, the Labour government in Western Australia increased its majority by three. In Queensland in May, the Labour government retained its majority of 23, and strengths also remained unchanged in Tasmania in an October election, with Labour continuing to hold office. At the resultant by-election for the Barker seat, the Liberal candidate was successful but with a majority of 5,000 less than in the previous December.

Inflationary pressures were again evident in 1956. On June 30 the retail price index was 6% higher than in the previous year. The basic wage, where tied to the retail price index, rose to 13 gs. per week in November, as compared with £12 5s. in June 1955. Advances for instalment purchases stood at £209,300,000 in June 30, 1956, as compared with £181,300,000 the previous

June, an increase of 14%. The government and trading banks, to ease inflationary pressure, adopted what the federal treasurer, Sir Arthur Fadden, described as a "policy of restraint." In March the prime minister, R. G. Menzies, introduced a supplementary budget, levying increased taxes on cars, motor fuel, liquor, cigarettes, tobacco and other "luxury" items. Customs and excise duties were also increased, and the bank overdraft interest rate raised to 6%. Menzies told parliament that without the program inflationary factors in the economy would end Australia's present high measure of prosperity and give the government a budget deficit of at least £30,000,000 for 1955-56. Following the supplementary budget, the treasurer announced in July a surplus of £61,300,000 for 1955-56, and in August he budgeted for a £108,700,000 surplus for 1956-57.

There were two anti-inflation conferences of premiers in Canberra during 1956; both ended in disagreement. The federal government sponsored the conferences in an endeavour to reach a uniform wage policy. In Sept. 1953 the commonwealth arbitration court had suspended quarterly cost-of-living adjustments of the basic wage for all members of commonwealth unions, but some state governments had continued to grant these adjustments to members of state unions. This led to an increasing disparity between federal and state basic wages. At a conference in August, the federal treasurer, Sir Arthur Fadden, sought agreement from all state premiers to the abolition of the quarterly cost-of-living adjustment. This the Victorian and New South Wales premiers refused unless the federal government reduced its spending and took other anti-inflationary measures they advocated. A similar conference in November also ended in stalemate. By the end of 1956, however, all states except New South Wales had suspended quarterly cost-of-living adjustments.

Despite more import restrictions, Australia ended the financial year with a visible overseas trade deficit of £46,800,000. The total deficit, including invisibles, was £221,500,000. On June 28 the government announced the halving of imports of fully assembled cars and a 30% cut in the import of unassembled chassis. Carpets, whisky, cigarettes and tinned "luxury" foods were other items affected. With heavy exports in October and improving prices for wool, Australia had a visible overseas trade surplus of £39,500,000 for the first four months of the financial year 1956-57. This was an £80,000,000 improvement on the position at the same time in the previous financial year.

Australia became the biggest single borrower from the International Bank for Reconstruction and Development when it was announced on Dec. 5 that the bank had approved a new loan of \$50,000,000 to Australia. This brought Australia's total borrowing from the bank to \$317,730,000.

Although Australia's planned migrant intake for 1955-56 was 125,000, there were actually 133,000 arrivals. A slight target reduction to 115,000 for 1956-57 was announced in August.

In the federal budget in August, the defense vote of £190,000,000 for 1956-57 was the same as the previous year. However, the division between the services showed substantial alteration, the estimates for the army and navy being reduced, and those for the air force and defense production being increased.

Between Sept. 27 and Oct. 21 the British ministry of supply carried out four experimental atomic explosions at Maralinga, South Australia. One was an atomic weapon dropped from a R.A.F. Valiant bomber.

After seven years of preparation the Olympic games were opened by the duke of Edinburgh in Melbourne on Nov. 22 and ended on Dec. 8.

Other events of importance during the year were the discovery of a great deposit of bauxite in the Cape York peninsula (the field was said to cover an area of 2,000 sq.mi. and to be 9 ft. deep), and the exceptionally severe floods which affected the

states of New South Wales, Victoria, Queensland and South Australia during July and August. A number of rivers, including the Murray, the Darling, the Burdekin and the Lachlan overflowed their banks, flooding great areas of farm and grazing land and causing damage estimated at many millions of pounds.

(R. R. Mv.; X.)

Education.—Schools (1953): government (including primary, secondary, junior technical) 7,595, pupils 1,149,915, teachers 40,237; private (all types) 1,958, pupils 366,086, teachers 13,898; vocational (1951) 146, students 159,310, teachers 6,784. Teacher-training colleges 15, students (1953) 7,141. Universities (1955-56): 10, students (including part-time) 23,925.

Finance and Banking.—Monetary unit: Australian pound, with an exchange rate of £A1.25=£1 sterling and £A0.45=U.S.\$1. Budget: (1955-56) revenue £A1,130,700,000, expenditure £A1,069,000,000; (1956-57 est.) revenue £A1,230,200,000, expenditure £A1,121,400,000. Total public debt: (June 1955) £A3,749,444,000, of which £351,019,000 to U.K. Currency circulation: (Jan. 1955) £A292,000,000; (Jan. 1956) £A335,000,000. Deposit money: (Jan. 1955) £A1,261,000,000; (Jan. 1956) £A1,252,000,000. Gold and foreign exchange holdings: (Dec. 1954) U.S.\$1,133,000,000; (Dec. 1955) U.S.\$835,000,000.

Foreign Trade.—(1955) Imports £A863,000,000, exports £A782,500,000. Main sources of imports: U.K. 44%; other sterling area 13%; U.S. and Canada 15%; continental E.P.U. (European Payments Union) countries 14%; Japan 3%. Main destinations of exports: U.K. 35%; other sterling area 18%; France 9%; other continental E.P.U. 13%; U.S. and Canada 8%; Japan 9%. Main exports: wool 45%; wheat 8%; butter 4%.

Transport and Communications.—Roads (June 1954) 839,600 km. Licensed motor vehicles (Oct. 1955): passenger 1,392,000; commercial 657,000. Railways (1954) 43,780 km.; freight (1954-55) 11,928,000,000 ton-km. Shipping (July 1955): merchant vessels of 100 gross tons and over 374; total tonnage 612,430. Air transport (1955): 1,780,488,000 passenger-km.; freight 81,756,000 ton-km. Telephones (Jan. 1955) 1,530,680. Licensed radio sets (June 1955) 2,034,676.

Agriculture.—Production (metric tons, 1955; 1954 in parentheses): wheat 5,323,000 (4,534,000); oats 726,000 (590,000); barley 828,000 (646,000); maize 91,000 (131,000); potatoes 376,000 (364,000); rye (10,000); apples (1953) 238,000, (1952) 176,000. Wool production (metric tons, clean basis 359,000 (327,000)). Food production (metric tons, 1955): milk 6,372,000; butter 190,800; cheese 45,600; beef and veal 757,200; pork 98,400; mutton and lamb 390,000; sugar, raw value 1,204,000. Wine production (1954) 1,150,000 hectolitres. Livestock (Sept. 1955): sheep 130,849,000, cattle 15,836,000, horses 803,000, pigs 1,297,000.

Industry.—Fuel and power (1955): coal 19,584,000 metric tons; lignite 10,272,000 metric tons; manufactured gas (year ended June) 1,226,400,000 cu.m.; electricity 16,104,000,000 kw.hr. Production (metric tons, 1955): pig iron (year ended May) 1,896,000; crude steel (year ended May) 2,244,000; zinc (smelter) 102,360; copper (smelter) 40,320; refined lead 228,000; tin (smelter) 2,040; cement (year ended June) 1,960,800; cotton yarn (year ended June) 15,840; wool yarn (year ended June) 19,320; gold 1,049,000 fine oz.; tin concentrates (Sn content, 1954) 2,108 metric tons. New houses and flats completed (1955) 80,355.

ENCYCLOPÆDIA BRITANNICA FILMS.—*Australia* (1948); *Bushland Symphony* (1955).

Austria. A republic of central Europe, Austria is bounded north by Germany and Czechoslovakia, east by Hungary, south by Yugoslavia and Italy and west by Switzerland. Area: 32,374 sq.mi. Pop.: (1951 census) 6,933,905; (1955 est.) 6,974,000. Language: German 98%, others 2% (mainly Slovene in Carinthia). Religion (1951): Roman Catholic 89.3%; Protestant 6.2%; Jewish 0.16%; most of the remainder professed no religion at all. Principal towns (pop., 1951 census): Vienna (cap.) 1,766,102; Graz 226,453; Linz 184,685; Salzburg 102,927; Innsbruck 95,055; Klagenfurt 62,782. President in 1956, Theodor Körner; chancellor, Julius Raab.

History.—Serious differences between the two coalition parties, the People's Catholic party (Conservatives) and the Social Democratic party (Socialists), led to the dissolution of the *Nationalrat* (parliament) and the subsequent holding of a general election on May 13, 1956. The People's party obtained 82 seats (gaining eight) and the Socialists won 74 seats (gaining one). The People's party majority over the Socialists increased from one to eight. The Communists were reduced from four to three and the neo-Nazis (newly formed Freedom party) from fourteen to six. The two main parties were strengthened at the expense of the two extremes, but the Conservatives to a greater degree than the Socialists. The most alarming decline for the latter was in Vienna, their traditional stronghold, where their number of votes fell from 590,290 in 1953 to 562,618 in 1956, as compared with a corresponding gain by the People's party whose votes rose from 362,119 to 406,631.

ESCAPING THE HEAT, thousands of bathers from Vienna, Aus., crowded into pools and rivers during the summer of 1956

It had spoken well for the political skill of the Austrian people that the coalition continued after the departure of the occupation forces. But as the result of the 1956 election the Socialists had to accept a certain reduction of their power in the government. Certain nationalized industries such as the huge Linz steel works, which had previously been under the control of the Socialist-administered ministry of transport and nationalized undertakings, were formed into a public company whose board of directors consisted of three Socialist and three Conservative cabinet ministers, the latter including the chancellor. A second group of semistate undertakings, namely those controlled by the big nationalized banks, remained under the non-party minister of finance, Reinhard Kamitz. All official and semi-official posts continued to be divided between the coalition partners according to the rules of "proportion"—in relation to the voting strength of the respective parties at the general election.

Neutrality was the keynote in foreign policy though there was never any doubt that Austria considered itself as part of the western world. The events in Hungary in October and November provided the first serious test and, with Soviet armour 30 mi. east of Vienna, brought home to the Austrians the dangers inherent in their geographical position. The U.S.S.R. claimed that arms and "Fascist" agents had been imported into Hungary over the Austrian frontier but this was denied by the Austrian government.

The exact interpretation to be put on the nature of Austrian neutrality remained subject to controversy. Both coalition parties approved of Austria's joining the Council of Europe although Switzerland was not represented in it. The Swiss example was studied with particular care in connection with the organization of the new army. The cadres of the army were ready when the occupation forces left. They had been trained in the western zones under the code name "Gendarmerie B" and were subject to the supervision of the Socialist minister of the interior, Oskar Helmer. The state secretary of this ministry, Ferdinand Graf, a Conservative, was on June 22 appointed head of the new ministry of defense and given a Socialist state secretary, Karl Stefani. Medical examinations were begun in May and the first conscripts were called to the colours in October. The army was to be kept at a strength of approximately 30,000 but armament was poor, consisting largely of out-of-

date equipment left behind by the United States and the U.S.S.R.

A mixed commission in Munich made good progress in dealing with economic differences that had arisen between Austria and the German Federal Republic as a result of the Austrian state treaty of 1955. From Oct. 22 to 24, 1956, Chancellor Raab visited Bonn and had friendly discussions with Chancellor Konrad Adenauer and other German ministers. Relations with Italy were darkened by what was claimed to be forcible Italianization of the Austrian minority in Italy's northern province of Alto Adige. This problem, which had cropped up from time to time since 1918, gave rise to some outbreaks of nationalism in Austria which seemed to find little response among the mass of the people.

On the eve of the Hungarian drama the country seemed more contented than at any other time since 1914. The Institute of Economic Research reported in April that during 1955 there had been a 14% rise in national income. Iron and steel production had trebled since 1938. Building activity had increased by 13% since 1954 and tourist traffic by 16%. The number of licensed motor vehicles rose from 530,000 in April 1955 to 650,000 in April 1956. Traffic congestion on a scale comparable with that of western European capitals was noticeable in Vienna, particularly during the September international fair where Austria's position at the crossroads between east and west was epitomized by large exhibits from the United States, China and the Soviet Union.

At the end of the year, the Southeast railway's modern-style station in Vienna was nearing completion and work proceeded apace on the Salzburg-Vienna motor road. The first of a series of huge power stations on the Danube was begun at Persenbeug in Lower Austria.

The rebuilt Vienna opera house experienced a period of crisis which culminated in the resignation of its director, Karl Boehm. As a result the office was divided into an administrative section and a musical section, with Herbert von Karajan appointed to the latter.

(V. T. E.)

Education.—Schools (1954): primary 5,222, pupils 780,835, teachers 7,250; secondary 176, pupils 77,022, teachers 4,485; vocational (excluding compulsory part-time) 174, pupils 37,822; teacher-training colleges 3, students 4,744. Institutions of higher education (1954) 14, students 19,954, teaching staff 2,391.

Finance and Banking.—Monetary unit: schilling, exchange rate 26 to the U.S. dollar. Budget (1955 actual; 1956 est. in parentheses): revenue 27,700,000,000 schillings (26,035,000,000 schillings); expenditure 26,800,000,000 schillings (28,208,000,000 schillings). Internal debt (1953) 11,183,300,000 schillings; external debt 2,052,300,000 schillings. Gold and foreign exchange holdings, central bank (March 1955) U.S.\$359,000,000; (March 1956) U.S.\$345,000,000. Currency circulation (Jan. 1955; Jan. 1956 in parentheses) 11,900,000,000 schillings (12,860,000,000 schillings). Deposit money (Jan. 1955; Jan. 1956 in parentheses) 15,980,000,000 schillings (15,360,000,000 schillings).

Foreign Trade.—(1955) Imports 23,068,000,000 schillings; exports 18,009,000,000 schillings. Main destination of exports: Germany 25%; Italy 14%; other continental E.P.U. (European Payments Union) countries 5%; U.S. and Canada 5%; sterling area 9%; U.K. 4%. Main sources of imports: Germany 35%; Italy 8%; other continental E.P.U. 19%; U.S. and Canada 12%; sterling area 9%; U.K. 5%.

Transport and Communications.—Roads (1955) 30,722 km. Motor vehicles in use (end Oct. 1954): passenger 89,035; commercial 53,817. Federal railways (1954) 6,026 km.; 5,179,325 passenger-km.; freight 6,049,000 ton-km. Telephones (Jan. 1955) 479,386. Licensed radio receiving sets (1954) 1,683,270.

Agriculture.—Production (metric tons, 1955; 1954 in parentheses): wheat 1,900 (452,000); barley 346,000 (312,000); oats 364,000 (334,000); rye 416,000 (370,000); maize 152,000 (149,000); beet sugar (raw) 190,000 (215,000); potatoes 3,005,000 (2,792,000); wine (hectolitres 1954) 370,000. Livestock (1955): cattle 2,346,479; sheep 254,570; pigs 2,933,633; horses 235,614; mules and asses 1,000; goats 256,078.

Industry.—Fuel and power (1955): coal 175,200 metric tons; lignite 588,000 metric tons; electricity (excluding industrial generation) 8,388,000,000 kw.hr.; manufactured gas (Vienna only) 345,600,000 cu.m.; natural gas 748,452,000 cu.m.; crude oil 3,664,992 metric tons. Production (metric tons, 1955): iron ore, 30% metal content, 2,844,000; pig iron 1,82,296; crude steel 1,822,956; magnesite 991,728; aluminium 67,848; copper (electrolytic) 10,320; cement 1,858,596; paper 401,340; nitrogenous fertilizers (N content, June 1954-55) 107,800; cotton yarn 23,160; woven cotton fabrics 15,120; wool yarn 11,520; rayon staple fibre 39,600; softwood (1954) 3,758,000 cu.m.; sawn hardwood (1954) 123,000 cu.m.

Automobile Industry. The year 1956, which marked the 60th anniversary of the start of the automobile industry in the United States, was the industry's biggest expansion year, as capital expenditures increased 68% over those of 1955. The 1956 expansion program included the following major expenditures: General Motors corporation, more than \$1,000,000,000; Ford Motor company, \$592,000,000; and Chrysler corporation, \$150,000,000. Other expansion was evidenced as G.M.'s new Technical centre—a 330-ac., 25-building site near Detroit—was dedicated May 15-16, 1956. In mid-June, the Ford Motor company broke ground for a multimillion-dollar research and engineering centre at Dearborn, Mich.

All-in-all, 1956 could be termed a "good year" for production. The impetus to sales by the introduction of 1957 models in October and November of 1956 was expected to put 1956 over the 6,000,000 mark. The industry marked an exceptionally good first half as 3,191,706 cars were built from January to June, a record topped only by the first six months of 1953 and 1955. The "big three," General Motors, Ford and Chrysler, had 96.25% of the total first half output compared with 94.68% in the first half of 1955.

Truck production of about 1,150,000 units was estimated for 1956 as heavy-duty truck output increased about 62% over 1955. The truck-trailer production in 1956 topped all previous years with a final total of about 75,000 units.

The year 1956 saw many changes within the industry as Kaiser and Willys motors dropped out of the passenger car business to concentrate entirely on utility vehicles, Willys becoming a wholly owned subsidiary of the Kaiser Motors corporation. The Studebaker-Packard corporation offered the Clipper as a completely separate line, and Ford introduced the Continental Mark II, a new prestige car in the \$10,000 price class. The Continental was a two-door hardtop coupé with a hood that extended back almost one-third of the over-all car length of 18 ft. Components of the car were subjected to stringent quality checks before, during and after assembly; and each unit was road tested before it was shipped from the factory in a fleece-lined canvas and plastic covering. The exclusive control of the Ford Motor company by the Ford family came to an end at the beginning of the year, when the Ford foundation sold 10,200,000 shares of common stock to the public.

The biggest change occurred at the end of July when

Studebaker-Packard corporation, Curtiss-Wright corporation and Daimler-Benz A. G. of west Germany came to an agreement whereby Curtiss-Wright, an aviation company formed in 1929, paid Studebaker-Packard \$35,000,000 for long-term leases on its plants at Utica, Mich., and South Bend, Ind., and for the outright purchase of Studebaker-Packard's Aerophysics Development corporation in Santa Barbara, Calif. All three plants thereafter operated as wholly-owned Curtiss-Wright subsidiaries, but Studebaker-Packard continued to function as a separate entity with its own board of directors and officers. Under the agreement, all Studebaker-Packard automotive manufacturing was to be concentrated at South Bend with the company operating in selected diversified areas of the automotive field instead of competing with the rest of the auto industry in all price classes. The over-all program provided for an option to Curtiss-Wright to buy 5,000,000 of unissued Studebaker-Packard stock for \$5 a share during the first two years of the three-year "advisory management" contract. Daimler-Benz, with a huge automotive plant at Stuttgart, Ger., was to supply Curtiss-Wright with important developments in the diesel and gasoline engine fields.

Dealer Relations.—The soaring auto market brought to a head many problems in the retailing of automobiles to the public. Dealers complained of factory pressure as cars poured from the production lines and competition became keen. Only a 1.7% profit of sales before taxes had been realized by dealers in 1955 as they cut prices and engaged in heavy advertising. During the first quarter of 1956 dealer profits were only 0.8%, compared with 3.1% during the same period in 1955.

Nearly 40 legislative measures were introduced during the 84th session of congress concerning factory-dealer relations. One,

the O'Mahoney-Celler "day-in-court" bill, passed and was signed by Pres. Dwight D. Eisenhower on Aug. 8, 1956. The law permits the nation's 40,000 dealers to bring damage suits in federal courts against manufacturers who fail to act in "good faith" in complying with the terms of dealer franchise agreements, or in terminating or not renewing the franchises.

The senate judiciary antitrust and monopoly subcommittee, headed by Joseph C. O'Mahoney (Dem., Wyo.), held hearings from Nov. 8 through Dec. 9, 1955, on the concentration of power in the auto industry. Facts were sought to help congress pass laws to "stabilize the relationship" between dealers and their factories. On Jan. 19, 1956, a senate interstate commerce subcommittee with A. S. Monroney (Dem., Okla.) as chairman began open hearings on complaints that had been aired by car dealers at the O'Mahoney hearings to the effect that their franchises were one-sided in favour of the factory. Dealers complained about phantom freight (freight charges that did not accurately reflect the transportation costs of the car from the factory to the showroom), bootlegging (the wholesale selling by dealers of new cars to used car lots) and unsound financing.

These hearings prompted the industry to review the whole structure of dealer relations and as a result, late in 1955, General Motors changed the duration of its contracts with dealers from one year to five years, giving dealers more long-term security. Then on March 1, 1956, General Motors announced broad changes in its dealer selling contracts including: (1) the assumption by G.M. of full cost of warranty adjustments; (2) larger allowances on all new cars of the preceding model year remaining in stock when a new model is announced; (3) assistance and substantial protection for the dealer with respect to disposal of his premises and leaseholds in the event of termination; and (4) inclusion of a detailed provision for evaluating dealer sales performance based on all factors, including local conditions.

Ford and Chrysler subsequently granted 100% warranty protection to their dealers. The "big three" took steps to kill phantom freight by realigning their destination charges to certain outlying areas, and named vice-presidents in charge of dealer relations to give dealers a direct channel of communication with top auto management.

Employment.—The longest strike in North American automobile history, a 148-day walkout at five General Motors of Canada plants, ended in mid-February for 17,000 United Automobile workers (U.A.W.) members. The settlement, which was to run to Aug. 1, 1958, was similar to the U.S. auto contracts negotiated in 1955, providing for supplemental unemployment pay, three annual hourly wage increases of six cents, improved pension and insurance benefits, adjustments in wage inequities and extra pay hikes for skilled workers. This package was valued at about 25 cents an hour. The strike had begun when 1956 model change-over operations were only partly completed and was estimated to have cost the workers \$26,000,000 and the company the production of 60,000 cars.

The week of June 4, 1956, marked the 20th anniversary of the U.A.W. union. As of that time, 17 states had approved the integration of supplemental unemployment benefits with state unemployment plans. Contracts won by the C.I.O. auto workers in 1955 required that there must be "integration" of state and company plans in states employing at least two-thirds of the firms' workers. Ohio, Virginia and Indiana turned down the integration that would permit a worker to collect both state and private unemployment pay. Five affected states had not decided either way.

At the end of June, a laid-off Detroit worker became the first person ever to draw a supplemental unemployment benefit payment. It was only \$13.93, but it increased by 40% the \$33 he drew weekly in Michigan unemployment compensation. There was enough money built up in the supplemental unemployment benefits funds—to which car companies had been contributing at the rate of five cents per hour worked by each employee—to provide four weeks of benefits to qualified workers unemployed because of the production slack-off that occurred in June.

Engineering.—Horsepower ratings continued spiraling upward as two makers pushed the power plants in their luxury production models beyond 300 h.p., Cadillac to 305 h.p. and Packard to 310 h.p. All other cars boasted of a 200-or-higher horsepower rating for at least one of their eight-cylinder engines. The Rambler's six-cylinder rating jumped from 90 h.p. in 1955 to 120 h.p. in 1956. The biggest numerical jumps were shown by Lincoln which went to 285 h.p. from 225 and DeSoto to 255 from 200. The average horsepower on 1956 models was 206.2 compared with 173.1 in 1955. The average compression ratio rose from 7.96 to 8.46, with Packard the highest at 10.0 to 1. The lowest ratio offered in 1956 was 7.44 to 1. All passenger car engines, including the sixes, adopted the 12-volt electrical system.

Improvements were made in three of the industry's automatic transmissions. Hydra-Matic got a new fluid coupling to provide smoother shifting; Buick added another stator to its Dynaflo torque converter to improve performance; the direct drive at cruising speed

was eliminated from the Studebaker Flightomatic in favour of a torque converter drive that operates at all times.

The Firebird II, General Motors' second experimental gas turbine car, was shown publicly for the first time in Jan. 1956. Greater efficiency and economy in this new gas turbine engine come from a regenerator or heat exchanger which recaptures more than 80% of the exhaust heat and uses it to preheat the incoming air. Road tests showed that the heat exchanger reduces fuel consumption at least 50% and also helps improve low-speed performance. On March 30 a 1956 Plymouth sedan powered with a regenerative gas turbine engine completed a four-day coast-to-

coast highway test which was run to obtain technical data on various turbine components under actual city and highway traffic conditions.

Another new type of engine for possible use in automobiles was unveiled during the dedication of the General Motors Technical centre near Detroit. Known as the free piston engine, it represented an entirely new concept in automotive power. Heretofore this type of engine had been used primarily in Europe for such applications as powering ships, locomotives, stationary power plants, and portable air compressors. The new G.M. engine has no crankshaft or connecting rods and no rotating drive shaft connecting it to the wheels as in a conventional automobile. The engine, which develops 250 h.p., consists of two parallel cylinders, each containing a set of two horizontally opposed pistons. Basically the pistons operate like a bicycle tire pump or old-fashioned fireplace bellows, blowing hot gases through a pipe to a turbine. These gases are relatively cool, no higher than 900° F., and therefore the turbine blades can be made of noncritical materials. A free piston engine can use a wide range of fuels, has few high precision parts, is inherently balanced and has an efficiency comparable to a diesel.

Styling.—So far as style was concerned, 1956 was mainly a face-lift year. Completely new bodies were introduced on the Lincoln and Rambler cars. Other makes had redesigned grilles, fenders and taillights. Some models were an inch lower, many were a few inches longer and even the lowest-priced series of the "low-priced three" had chrome trim. Studebaker introduced a line of family-style sport cars. At the beginning of the 1956 model year, buyers found that 60% of the various model types available were either hardtops, station wagons or convertibles. About 30 different four-door hardtops were offered as the rest of the industry adopted this model first introduced in 1955. Among the preferred body styles of 1956 was the station wagon, which had leaped from 2.3% of the market in 1947 to approximately 12% in 1956.

Automobile Racing. Pat Flaherty, Chicago, Ill., driver, captured the big prize of American racing when he won the 500-mi. Indianapolis (Ind.) Speedway classic on May 30, 1956. Roaring over the track at an average of 128.490 m.p.h., Flaherty brought John Zink's Special in at the head of a field of 33 starters. Sam Hanks of Pacific Palisades, Calif., was second; Don Freeland of Los Angeles, Calif., third; and Johnny Parsons of Van Nuys, Calif., fourth. The victor received \$93,819, a new high from a record total payoff of \$282,050. The race was slowed 11 times by accidents that brought injuries to four drivers while several others had narrow escapes.

The accidents at Indianapolis were only a few of many during the year of racing. Flaherty himself was badly injured at Springfield, Ill., on Aug. 18. Leading for the U.S. driving title, he retired for the season. He had set a record in winning a 100-mi. big car event at Milwaukee, Wis., on June 10. Bob Sweikert of Indianapolis, winner of the Indianapolis 500-mi. race in 1955 when he was the top driver of the United States, lost his life on June 17 at Salem, Ind. His car went out of control and broke into flames after crashing through a guard rail. Walt Faulkner of Long Beach, Calif., and Ernie McAfee of Los Angeles, Calif., were among other prominent drivers killed in competition during the season.

Juan Manuel Fangio, Argentina's world champion sports car driver, triumphed in the Grand Prix of Endurance at Sebring, Fla., in March. Fangio teamed with Eugenio Castellotti of Italy to bring their Ferrari home first in the sixth annual 12-hr. test.

Another feature of the U.S. season was the week-long meet of the National Association for Stock Car Auto Racing (NASCAR) held at Daytona Beach, Fla., in February. Top driving honours were won by Tim Flock of Atlanta, Ga. Among his feats was a victory in the 160-mi. Grand National Circuit test, the feature race. He also set a record qualifying mark of 135.74 m.p.h. in a Chrysler 300B. He drove the same type car to victory and a record in the passenger-car time trials with an average of 139.373 m.p.h. over a measured mile. Flock also was easy winner in the 125-mi. sportsman and modified race with a 1939 Chevrolet powered with a 1956 Oldsmobile engine.

Jimmy Bryan of Phoenix, Ariz., clinched the United States Auto club's big car title for 1956 and Pat O'Connor, North Vernon, Ind., won midwest sprint laurels. Going into Oct. 1956 Johnny Mantz was leading the stock car group, Shorty Templeman was in front of the midget car drivers and Tommy Hinner-shitz was pacing the sprint racers in the east. Buck Baker and Herb Thomas were leading on points for the NASCAR grand national championship.

Major Speed Records.—Numerous standards were improved in 1956 and Bonneville Salt Flats in Utah was the site of many record-breaking feats. The United States Auto club certified 458 international and American marks made by three 1957 Fords Sept. 9–28. Speeds reached 131.24 m.p.h. on the famous 13-mi. straightaway. One car ran 50,000 mi. at an average of 108.16 m.p.h. and averaged 120.62 m.p.h. for the first 24 hrs. The run, lasting 19 days and nights, was made on a 10-mi. circular course.

Following is a résumé of some other leading events of 1956:

Buenos Aires (Arg.)—Averaging 79.4 m.p.h. for the 3-hr. race, Juan Manuel Fangio drove a Ferrari home first.

Tour de Sicily (Palermo)—Peter Collins of England (Ferrari) defeated Italy's Pietro Taruffi (Maserati) by only 55 sec. in the annual 650-mi. grind.

Syracuse (Sicily)—One of the closest races of 1956 resulted in victory for Fangio, who was clocked at 2 hr. 48 min. 59.9 sec. in his Ferrari. The race of about 200 mi. drew 80,000 fans.

Brescia (It.)—Eugenio Castellotti (Italy) captured the famed Mille Miglia road race on April 29. The veteran, in a Ferrari, negotiated the dangerous course of 992.3 mi. in 11 hr. 37 min. 10 sec. The race was run in rain and was marred by numerous accidents that brought death to three drivers and four spectators. The event drew 330 starters, but wrecks forced out many.

Monte Carlo (Monaco)—Britain's Stirling Moss (Maserati) captured first place with Fangio (Ferrari) second. Moss was the first Briton ever to win the event.

Cumberland (Md.)—The national sports car championships were held May 19–20 with Walter Hansgen of Fairview, N.J., and Paul O'Shea of Rye, N.Y., winning the two top prizes. Hansgen in a D Jaguar nosed out

TIRE FLYING high off the track as racing driver Tony Bettenhausen crashed into retaining wall during the 1956 Indianapolis, Ind., Memorial day race

Jack McAfee of Sherman Oaks, Calif. (Porsche Spyder), in modified classes B, C and D. O'Shea was first in the group for production cars of classes C and D. O'Shea, 1955 champion of the Sports Car Club of America, won in a Mercedes-Benz 300SL.

Chimay (Belg.)—Four onlookers were killed and thirteen others injured when a blazing car hurtled into the crowd watching the Grand Prix des Frontiers on May 20. The race was won by Benoit Musy of Switzerland (Maserati).

Francorchamps (Belg.)—Peter Collins (Ferrari) won the 360-mi. test when Fangio was forced out after about two-thirds of the race.

Rheims (Fr.)—Peter Collins (Ferrari) averaging 121.16 m.p.h. turned in best average speed recorded for a race on any European circuit on July 1.

Rouen (Fr.)—The fifth Rouen Grand Prix for sports cars was won by Castellotti (Ferrari).

Silverstone (Eng.)—Fangio pushed his Ferrari over the course of 303 mi. at an average 98.65 m.p.h. to gain his first victory in this event. The race drew 100,000 spectators.

Le Mans (Fr.)—One driver died and several others were injured during the Grand Prix endurance event July 28-29. Louis Hery, French driver, was killed after his car overturned and caught fire on first lap. The team of Ron Flockhart and Ninian Sanderson of Scotland (Jaguar) won the 24-hr. grind covering 2,521 mi. at an average of about 104.3 m.p.h. Only 14 of 49 starters finished the race, which was attended by 150,000 spectators.

Stockholm (Swed.)—Italy's Ferrari works clinched the world sports car manufacturers' title for 1956 when Maurice Trintignant of France won on Aug. 12. The victor's time was 6 hr. 33 min. 47.7 sec. for the 621-mi. course.

Montgomery (N.Y.)—Carroll Shelby of Dallas, Tex., one of the year's top drivers, captured his 18th and 19th consecutive sports car races on Aug. 19 in the first meet ever held at Montgomery. Piloting a 3.5-liter Ferrari, Shelby led the field of modified cars of the C, D and E classes. Shelby then won the closing event for modified cars and the first five finishers from four other races.

Thompson (Conn.)—Walter Hansgen starred in the two-day meet at Thompson raceway Sept. 2-3. Hansgen in a D Jaguar roared over the twisting 1.5-mi. course to win by only 3 sec. from John Fitch of New York city (D-Jaguar). Hansgen, Richard Thompson, Jr., of Washington, D.C. (Corvette), Paul O'Shea (Mercedes-Benz 300SL) and Masten Gregory of Kansas City were among the first-day victors.

Monza (It.)—Stirling Moss won from Fangio by only 5.8 sec., with a record average of 129.656 m.p.h. Piloting a Maserati, Moss led 24 entries representing seven countries over the course of 500 km. in 2 hr. 23 min. 41.3 sec.

Fangio retained his world driving championship, based on points.

Watkins Glen (N.Y.)—The ninth annual sports car Grand Prix on Sept. 15 was won by George Constantine of Sturbridge, Mass., in a D Jaguar. (T. V. H.)

Aviation, Civil. The year 1955 marked the completion of a decade of postwar service by the air lines of the world. It was a decade during which U.S. scheduled air lines evolved into the world's most competitive and most efficient air transport system, which carried more than 60% of the air commerce of the world outside the "iron curtain."

In 1955, the last year of the postwar decade, revenue passenger miles for the entire United States industry went up to 24,339,245,000, from 20,598,984,000 in 1954, a gain of 18.1%, while passenger revenues rose from \$1,166,554,000 in 1954 to \$1,363,580,000 in 1955 for an increase of 16.3%. Total revenues went up from \$1,420,850,000 in 1954 to \$1,607,689,000 in 1955 for a gain of 13.35%. At the same time, industry public service revenues dropped about 42%, from \$66,537,000 in 1954 to \$34,110,000 in 1955, or 2.4% of total revenues.

Express ton-miles for the entire industry totalled 51,332,000 in 1955, up 24% from the 41,524,000 total in 1954, while freight ton-miles rose from 234,850,000 in 1954 to 274,885,000 in 1955 for an increase of 17%.

The growth was continued during the first six months of 1956, as shown in Table I.

Toward the end of July 1956 the scheduled air lines of the nation carried their 300,000,000th passenger. It had required 24 years to count the first 100,000,000 passengers, four years to count the second 100,000,000 and two years to count the third 100,000,000.

In 1956 the scheduled air lines instituted a "no-show" control plan, which requires a passenger who makes an advance reservation to pick up his confirmed ticket, indicating positive reservation of a seat, before a deadline agreed to by the passenger and the air line. Failure to comply means cancellation of the reservation. This plan reduced the number of late cancellations and "no-shows"—the persons who fail to cancel reservations and do not use them—thereby making available to others

CONTROL AREA for automatic operation and regulation of runway lighting installed at O'Hare field near Chicago, Ill., in 1956

seats which would otherwise have been unoccupied.

During 1956 the air lines' Special Committee on Rotorcraft issued a report which emphasized that transport rotorcraft must be redesigned to attract the short-haul market, a market that demands low fares. The report outlined recommendations and operational procedures for two types of multiengine transport rotorcraft. One would be for serving large metropolitan centres to supplement existing ground transportation. This rotorcraft, with a capacity of 25 passengers plus baggage, would serve a radial route system, generally less than 75 mi., from a large central city to surrounding communities.

The second type of rotorcraft, with a 35 to 50 passenger and baggage capacity, would be for scheduled air transportation on intercity or local service routes which require such service but do not have the facilities to permit safe operation of fixed-wing aircraft.

Also during 1956 the scheduled air lines began negotiations with Collins Radio company for an aircraft proximity warning indicator in preparation for the use of jet planes in commercial air transportation.

Because of the special needs of the military services, a decision was made by the federal government in 1956 for a new common short-range air navigation system called vortac. The system would retain VOR (very-high-frequency omnidirectional range) to provide azimuth information. It also would call for

installation of the tactical military navigation system (TACAN) at the same site as the VOR equipment. Such colocation of equipment would provide for common routes for both military and civil aircraft, which were essential to the maintenance and improvement of the presently overloaded traffic control system. The government decision did not interfere with the continued expansion of VOR and ILS (instrument landing system), as provided in the CAA (Civil Aeronautics authority) three-year plan.

The year 1956 also marked the beginning of a new era for the scheduled air lines as the industry prepared to enter its third equipment revolution since World War II. The new equipment would usher in the age of jet transportation. The industry, after placing its first turboprop air liners in service and ordering other new and advanced types of equipment in 1955 to the amount of \$1,700,000,000 committed itself to additional investments in equipment. By Oct. 1956 the industry had on order, for delivery beginning in 1958, a total of 279 long-range, turbine-powered giant air transports and 162 medium-range, turbine-powered air transports. The value of these aeroplanes alone would be considerably more than \$2,000,000,000, and there were indications that within the next ten years more than \$3,500,000,000 would be spent on new equipment.

The new jet planes which the U.S. scheduled carriers had on order were of two types, the turboprop, which uses the jet engine to drive propellers that pull the plane through the air, the same as present-day commercial planes fly, and the pure jet or turbojet air liner, which uses the forward thrust from the hot gases blasting out of tailpipes to push the jet liner through the skies.

The turboprop air liners were:

1. Vickers Viscount, powered by four Rolls-Royce turboprop engines, capable of carrying 48 passengers at about 385 m.p.h. for a maximum range of 1,500 mi. (28 of these were in service in the U.S. as of June 30, 1956).

2. Lockheed Electra, powered by four Pratt & Whitney T-34 turboprop engines, capable of carrying 60 to 70 passengers at about 400 m.p.h. for a maximum range of 2,000 mi.

3. Fairchild F-27 Friendship, powered by two Rolls-Royce engines, a high-wing 40-passenger short- and medium-range air liner with a cruising speed in excess of 280 m.p.h.

The pure jet air liners were:

1. Boeing 707 Stratoliner, in three versions, all powered by four engines capable of 550-600 m.p.h. (a) A 109-passenger design powered by Pratt & Whitney J-57 jet turbine engines, primarily for medium-distance hauls, (b) a similar model with Pratt & Whitney J-75 engines capable of flying nonstop across the U.S., (c) the intercontinental Stratoliner, to carry 122 passengers, with ten feet more wing span and ten feet longer cabin, capable of flying the Atlantic nonstop, with a maximum range of 4,700 mi.

2. Douglas DC-8, two models, domestic and intercontinental, both capable of 550-600 m.p.h. The domestic DC-8, powered by four Pratt & Whitney J-57 jet engines, would carry 122 passengers with a range of 3,700 mi. The intercontinental version, powered with the Pratt & Whitney J-75 jet engines, was capable of flying 4,600 mi. nonstop.

3. Convair 880, for short-range operation (700 mi.), capable of carrying 50 to 60 passengers at 500-550 m.p.h., was powered with four General Electric J-79 engines.

4. Comet, British, was capable of carrying 50-60 passengers in the 500- to 550-m.p.h. speed range. It was a medium-distance air liner powered with four Rolls-Royce jet engines.

The commercial air lines are only one user of the country's air space. In number of aeroplanes, the U.S. air-line fleet in 1956 comprised only about 1.5% of the aeroplanes in the country. The military forces had about 35,000 planes, private flyers had

about 42,000, and the business and corporate aircraft fleet totalled about 18,000.

(S. G. TN.)

Great Britain and Europe.—Air-line traffic continued to increase throughout the year, and direct operating costs were held steady in consequence of the introduction of more efficient aircraft and improvements in organization. There was some justification, therefore, for a 20% reduction in tourist fares from October on the North Atlantic services. The demand for this change was made by the United States operators under pressure from the U.S. Civil Aeronautics board and was accepted by other Atlantic operators affiliated to the International Air Transport association (I.A.T.A.). Since the reduction in fares could be met only by a marked increase in traffic, some European operators would have preferred the change to be delayed until they had got fleets of new aircraft fully into service.

British Overseas Airways corporation was one of these. Although it had made a net profit of £117,731 in the financial year 1955-56 it was involved in heavy transitional expenditure and at the end of the year was still short of aircraft. This arose from the need to prove the new Britannia turboprop liners, from a

big training program for the conversion of crews to the new types and from a delay in the delivery of the fleet of 33 Britannias. Proving flights finally had to be abandoned for the year, 60 air crews preparing for duty on Britannias were returned to other duties, and there was no hope of putting Britannias into service until the spring of 1957. The effect on the year's prospects of B.O.A.C. was expected to be serious.

Other European operators were receiving new aircraft and were engaged in putting them on the routes. Additional competition was appearing from the German company Deutsche Lufthansa, in full operation on the Atlantic services with the latest type of U.S. liner. Reaction to the American demand for cheaper tourist fares was also affected by feverish preparations to introduce jet aircraft on the North Atlantic run possibly in 1960.

The appearance of two jet liners in the United States started a rush among operators in many countries to prepare for the new era in commercial air transport. Before the test flying of the Boeing 707 and the Douglas DC-8 was completed, orders were placed for more than 200 of these aircraft, which when developed promised enough range for nonstop operation between the capitals of western Europe and New York at cruising speeds of about 550 m.p.h. This placed them in a strong competitive position in relation to the British Comet IV, capable of a range of 2,800 mi. at a cruising speed of 500 m.p.h. The Comet IV, no longer regarded as suitable for first-class Atlantic services, began to be considered for medium-range services, and a small fleet was ordered by Continental Airlines for its domestic routes in the United States. Similar jet liners were also in preparation by two manufacturers in the United States. At the end of the year B.O.A.C. and de Havilland were working out a specification for a new jet liner, the D.H. 118, capable of the same speed and range as the U.S. jets, but of smaller capacity. This was to be ready for service by 1962.

In addition to the Britannia, at least one other long-range turboprop air liner was on the stocks. B.O.A.C. was committed to the use of Comet IVs and Britannias—19 of the former and 33 of the latter—but the corporation, like most other operators, came to the conclusion that it must have at least 15 of the bigger jet liners to be able to compete on equal terms over the North Atlantic. The extent of the orders for big jets caused anxiety concerning the ability to fill all the seats that would become available in the large number of fast, new aircraft likely to appear on the routes in 1960-61. The director general of the I.A.T.A. remarked on the cost of the new equipment as repre-

senting more than a year's revenue of the world's air lines and flatly asserted that the new aircraft would demand more load than passengers alone could supply. This view was disputed by another school on the assumption that the steady annual increase of 16% to 18% in traffic of the past ten years would continue and that by 1960 additional traffic would accrue from the opening of new routes between west and east.

Support for this belief was found during the year in the emergence of the two-jet Soviet liner, the Tu-104, which made several special flights between Moscow and London and intermittently operated on routes in the Soviet Union. The U.S.S.R. also announced two new commercial types, a bigger jet and a turboprop liner, as approaching completion, and showed signs of its intention to embark on international air transport and to enter the aircraft market. The Tu-104, roughly comparable with the Comet IV, was offered for sale at about half the price of the Comet. Two services between western Europe and Moscow were started, one through Prague and another through Helsinki, with passengers transferred to Soviet aircraft on most services. One through flight from London to Moscow by a Viscount of British European airways was allowed.

Air France had a small number of two-jet Caravelle liners on order and intended to put them chiefly on the route to North Africa. Other European operators were examining the characteristics of smaller jet aircraft known to be in preparation by U.S. makers, but British European Airways seemed likely to arrive at jet operation at a much later stage.

Swissair and Sabena were adding Convair Metropolitans to their European fleets. Some re-equipment on a small scale was being undertaken by British independent operators, many of whom had been licensed to work regular services for periods up to ten years but were not sufficiently secure to warrant major capital investment programs. Among the principal operators, extremely heavy commitments were being undertaken. New aircraft on order at the end of the year represented £60,000,000 for B.O.A.C., £50,000,000 for Air France and £30,000,000 for K.L.M. (the Dutch air line). All the companies had had a profitable year, and traffic was continuing to increase. The rate of increase showed some sign of slowing down on European domestic routes, but the I.A.T.A. expected the average percentage increase of the past ten years to be realized in world traffic.

(E. C. SD.)

Agricultural Aviation.—Acreages covered and types of crops treated by aeroplane in the United States during 1956 varied little, generally, from 1955. Certain areas saw more, some less,

SOVIET JET AIR LINERS at London, Eng., airport in April 1956. The planes, known as Tu-104s, were used to bring various U.S.S.R. official visitors to the British city

of this activity, depending on local conditions.

Within the industry itself, advances were made in both equipment and methods. The latest developments toward achieving an ideal aircraft for applying insecticides, herbicides, fungicides, fertilizers and the like were: Auster's (England) Agricola, a low-wing monoplane with a small engine, equipped to carry a pay load of 1,200 lb.; Transland's Ag-2, a somewhat larger low-wing monoplane, designed for pay loads in excess of one ton; and National's "remanufactured" Stearman, a modification of a popular World War II biplane which utilized National's own high-lift wings and had a pay load capacity of up to one ton. All three were especially designed to carry a bigger pay load on less horsepower, and all incorporated the latest ideas in dispersal equipment to give more effective distribution of both dust and liquid chemicals.

The shortage of experienced agricultural pilots was felt during parts of the year in most farm areas. In an attempt to alleviate this situation, two more schools were opened for training commercial pilots for this type of flying, at Ohio State university and South Dakota State college. Both offered limited courses almost identical to that started by Texas Agricultural and Mechanical college in 1955. Like Texas A. and M., both had the co-operation and aid of the Civil Aeronautics administration and of state aviation and agricultural interests.

The industry's first international agricultural aviation show was held at Palmerston North, N.Z., in Nov. 1956. Held in conjunction with the seventh International Grassland congress, this meet attracted hundreds of scientists as well as agricultural and aviation interests from all parts of the world.

(W. D. AN.)

Aviation, Military. **United States Air Force.**—By June 30, 1956, the United States air force had attained 131 wings, marking the highest level of combat effectiveness since the postwar reduction from 243 wartime groups to a 1950 level-off at 48 wings. The Korean war marked the polarizing of east and west into two armed camps, and sharply reversed the trend of low defensive strength. In July 1950, the air force began an expansion toward a goal currently set at 137 wings by June 30, 1957.

This buildup enhanced the capabilities of the three combat commands—Strategic Air command (SAC), Tactical Air command (TAC) and Air Defense command (ADC)—which celebrated their 10th anniversaries on March 21, 1956.

In 1956 the SAC objective was an all-jet bomber force, with the B-52 gradually supplanting the B-36 in heavy bombardment wings. Until replaced, the B-36, last of the large piston-engine bombers, would remain a principal weapon in SAC's long-range retaliatory force. In 1956 the B-47 medium bomber still figured prominently in SAC planning.

TAC's light bomber, fighter and fighter-bomber units further increased their use of aerial refueling which added greatly to their mobility. The nuclear capability of TAC units was also increased in 1956. They were deployed in Europe, the far east and the United States. Four TAC wings were equipped with B-57 jet bombers during 1956, and one wing began receiving B-66's. The F-100, first of the truly supersonic series of fighters, began replacing the F-86, and production started on the F-104 day-fighter, scheduled for use by both ADC and TAC. Three Matador tactical missile squadrons were stationed in Europe, and a fourth squadron was organized in Sept. 1955.

Air defense of North America was bolstered by a firm agreement with Canada. In Sept. 1956 the responsibility of the Continental Air Defense command was extended to Alaska and the northeast. The joint air defense placed great reliance on the growing Distant Early Warning (DEW) line network along the

Arctic circle. Canada was constructing the Mid-Canada Warning line, north of populated areas. North of the U.S. border, the Pine Tree line was in full operation. U.S. radar stations covered areas 150 mi. out into the Atlantic and Pacific oceans, and in 1956, U.S. navy radar picket ships and U.S. air force air-borne early warning and control planes extended this coverage far out to sea. Texas towers (fixed radar stations) were being positioned off the Atlantic coast. The first installation, off Cape Cod, began operating in Dec. 1955. Two more were under construction. (See also CIVIL DEFENSE, U.S.)

In 1956, the Military Air Transport service (MATs) progressed toward its goal of increasing airlift by 50% between 1955 and 1960. With an air fleet of 1,454 planes, including 625 four-engine aircraft, MATs compiled the following record:

Year	Ton-miles (million)	Increase	Total tonnage	Increase
1955	654		194,305	
1956	776	18%	254,224	30%

In the summer of 1955, published accounts of intelligence reports indicated that the Soviet Union had made unexpected progress in the field of ballistic missiles. Late in Oct. 1955, the U.S. secretary of defense, Charles E. Wilson, assigned to the air force the task of building the WS-315A Thor, an intermediate range ballistic missile (IRBM) with a range up to 1,500 mi. In Nov. 1955, Pres. Dwight D. Eisenhower accorded the highest national priority to the research, development and production of ballistic missiles. The air force accelerated its efforts to produce the SM-65 Atlas, which would be the first U.S. intercontinental ballistic missile (ICBM), and in March 1956 announced a second source contract in Denver, Colo., to produce the Titan, an alternate ICBM. Other strategic missile developments included the supersonic SM-64 Navaho and the subsonic SM-62 Snark. In Nov. 1955, the Snark had successfully completed a 2,000 mi. flight, the longest of any U.S. missile to that date.

To complement accelerated research and production, the air force in July 1956 began instrumentation work on Ascension Island, the final and most distant station of its 5,000-mi. South Atlantic missile test range, extending southeast from the air force missile test centre, at Patrick AFB, Fla.

Two noteworthy records were established by the slender, swept-wing X-2 research plane, which was carried aloft under a B-50 mother ship and then turned loose. On July 25, 1956, Lt. Col. Frank K. Everest flew the X-2 faster than man had ever flown. In September, with Capt. I. C. Kincheloe, Jr. at the controls, the X-2 reached the highest altitude ever attained by man. The last flight of the X-2 took place on Sept. 27, 1956. While probing the thermal (heat) barrier, during this last flight which took him to his death, test pilot Capt. Milburn G. Apt exceeded Everest's earlier speed record.

At the Bikini atoll, on May 21, 1956, a B-52 flying at approximately 50,000 ft. dropped the first hydrogen bomb from a U.S. plane. The bomb, in the megaton range (a megaton is equivalent to 1,000,000 tons of TNT) was exploded over Namu Island.

In June 1956, Air Secretary Donald A. Quarles, announced a further step-up of B-52 production to reach an estimated 20 per month within 18 months. Congress authorized an additional \$900,000,000 for air force expenditure during the 1957 fiscal year, with about \$800,000,000 of it for additional B-52 procurement. This increased the air force military appropriation for fiscal year 1957 to \$16,459,000,000, 47.6% of the total military appropriation.

In other 1956 aircraft procurement, the manufacture of KC-135 jet tankers was sharply accelerated to attain a rate of 20 per month to parallel B-52 production. Increased numbers of jet Stratotankers would give SAC's retaliatory force longer range and more flexibility in employment. F-102A interceptors,

DEMON FIGHTERS, F3H-2N all-weather planes delivered to U.S. navy fleet squadrons in 1956. The plane was designed for supersonic speeds and could carry, depending upon the mission, external loads of missiles, rockets, bombs, fuel tanks or other stores in addition to its four 20-mm. cannon

initially manufactured at a low rate to permit engineering changes, began to enter Air Defense command units, and the F-89H, a modern all-weather interceptor, was delivered in quantity. The air force cancelled F-86 fighter production and used the money to purchase more F-100s. Substantial numbers of C-123 assault transports and the C-130 turboprop troop carriers were produced. The turbojet C-133A, the biggest transport to date, was designed to haul a cargo of 50,000 lb. 3,500 mi. It made its first flight in April 1956.

Air force personnel totals tapered off from 960,000 to 910,000 in the year ending June 30, 1956, simultaneously with an increase of 10 wings from 121 to 131. This increase in combat capability with fewer personnel underscored the most important problem facing the air force, that of attracting and retaining more professional and technical personnel in service. To help meet this problem Secretary of Defense Charles E. Wilson created a committee to study the question of adequate compensation of highly skilled personnel.

The air force civilian components programs received heavy emphasis. On June 30, 1956, 17 fighter squadrons of the air national guard stood runway alert with the Air Defense command. Total personnel of 63,534 manned 27 wings and 2,138 aircraft, including 1,565 jets. On the same date, one air force reserve fighter-bomber wing also stood runway alert. Air force reserve strength totalled 344,262 officers and airmen, of whom 287,731 were classified as ready.

The Mutual Defense Assistance program continued to help countries establish new air forces or modernize and expand existing forces. During 1956, 35 nations received planes and equipment plus technical and training assistance in their use. Under the program, for the seven-year period ending June 30, 1956, the U.S. air force made available \$6,500,000,000 including \$4,200,000,000 worth of material shipped to recipient nations. NATO countries received \$2,800,000,000 from this phase of the program. Since 1949, 11,827 aircraft plus spare parts and associated equipment were shipped to meet U.S. air force requirements, enabling recipient nations to form 202 squadrons (123 NATO squadrons) including 135 squadrons equipped with jet aircraft.

With total assets of \$70,000,000,000 the air force was the biggest business in the United States.

(N. F. T.)

United States Navy.—Fleet aviation in 1956 contributed power and balance to forces designed to preserve peace in the world and to launch instant offensive action in event of war.

Emphasis on striking power rather than numerical strength remained a dominant feature of growth. Through modernization of weapons and techniques, adaptation of new weapons to naval uses, and increased capability for delivering atomic weapons, fleet forces gained a capacity to strike faster, harder and over greater areas than ever before. Although the number of operating units was slightly increased, numbers of aircraft and personnel on board remained about the same. Navy and marine corps combined, the strength of naval aviation in Jan. 1956 was 9,600 operating aircraft and 28,000 officers and 161,000 enlisted men.

Attack carrier forces were strengthened in 1956. Commissioning of the U.S.S. "Saratoga" on April 15 and launching of the U.S.S. "Ranger" on Sept. 29 added one Forrestal class carrier to the fleet and promised another within months. Six Midway and Oriskany class conversions completed during the year added as many angled decks to fleet power potential.

To operate from these ships, two all-weather fighters, the F3H-2N Demon and F4D Skyray, and the fast interception and attack type FJ-4 Fury, joined the fleet early in 1956. Twin-jet A3D Skywarriors, capable of transcontinental flights in less than five hours without refueling; A4D Skyhawks, small but hard-hitting attack planes; and F9F-8P Cougar photographic planes also went into operation. The F8U Crusader, winner of the Thompson trophy with a record speed of 1,015.428 m.p.h., and the F11F Tiger completed carrier suitability trials in April.

Three guided-missile systems were fully operational. The first carrier missile squadron, equipped with F7U-3M Cutlass aircraft armed with Sparrows, deployed to the Mediterranean. Carriers, cruisers and submarines conducted operations with the surface bombardment missile, Regulus I. Patrol squadrons acquired new offensive power with the assignment of the antishipping missile Petrel. Commissioning of the U.S.S. "Boston", Nov. 1, 1955, and the U.S.S. "Canberra", June 15, 1956, added two Terrier missile cruisers to fleet air defense.

Other aviation elements were similarly strengthened. Anticipating the operational assignment of P6M SeaMasters, conversion of the seaplane tender "Albemarle" to support jet seaplanes began in February. The four-engine turboprop seaplane, R3Y Tradewind, joined fleet logistic support forces and demonstrated its capability as an aerial tanker for use in conjunction with carrier aircraft operations. Commissioning the first helicopter assault carrier, "Thetis Bay", added vertical envelopment tactics to new concepts of amphibious assault.

Progress in advanced research was marked by the inclusion of funds for nuclear power plant components for an aircraft carrier and a guided missile cruiser in the 1957 shipbuilding program, beginning construction of a prototype reactor and study of the feasibility of adapting nuclear power to large seaplanes.

Several outstanding flights demonstrated progress in aircraft and engine design. On Oct. 15, 1955, an A4D Skyhawk established a 500-km. world speed mark of 695.163 m.p.h. A3D Skywarriors scored several unofficial records, the most outstanding being a 3,200 mi. nonrefueling flight from Honolulu, T.H., to Albuquerque, N.M., in 5 hr. 40 min. Two P2V Neptunes and two R5D Skymasters forged the first air link with Antarctica in a flight on Dec. 20, 1955, from New Zealand to McMurdo sound. Most outstanding was the record speed set by the F8U-1 Crusader on Aug. 21, 1956. In standard carrier fighter configuration during

its record performance, this was the first operationally equipped jet aeroplane in history to exceed 1,000 m.p.h.

(See also MARINE CORPS, U.S.; MUNITIONS; NAVIES OF THE WORLD.) (W. V. D.)

Air Forces of the World.—Several developments took place during 1956 which promised to have an important bearing on the future direction and progress of world military aviation.

For the first time since World War II, the U.S.S.R. revealed something of Soviet air power potential and technical achievements. On June 24, leading military representatives, including Gen. Nathan F. Twining, U.S. air force chief of staff, and newsmen of all principal countries were treated to a mass demonstration and flying display at Moscow's Tushino airport. This was followed by visits to several aircraft and engine plants and the Kubinka air force base.

Meanwhile, most of the member nations of NATO continued the buildup of their respective air forces and aircraft production. Both Germany and Japan re-entered the aircraft manufacturing field and achieved some notable accomplishments during the year. Oddly enough, it was France who took one of the first steps to put western Germany's aviation industry back on its feet by licensing German companies to build the French Fouga Magister and the Nord 2501 Noratlas aeroplanes.

On Oct. 29, 1956, Israel invaded Egypt, backed up by the armed forces of England and France. Within a short time the Egyptian air force had reportedly been destroyed, and British Canberra bombers, with Hunter Hawker fighter escorts, had bombed all military objectives around the Suez canal. What effect, if any, this would have on the other air forces of the world remained to be seen.

U.S.S.R.—At Tushino, the Soviet air force displayed an array of operational aircraft ranging from record-breaking helicopters through turbojet transports, supersonic day fighters, light, medium and heavy jet bombers, a transonic all-weather interceptor and a large turboprop bomber having intercontinental range.

In a fly-by of experimental types, foreign visitors got a first glimpse of the 1,200-m.p.h. Super Farmer MIG-21, designed by a team headed by Artem Mikoyan. Also seen for the first time were three new delta-wing aircraft, designed by Pavel Sukhoi, capable of supersonic flight in the estimated range of Mach 1.5. Although it was too early to evaluate the significance of these particular fighters, they showed that the Soviets had not neglected the delta type of design. For lack of official designations, NATO observers nicknamed these aircraft Fishbed A, Fishbed B and Fishpot.

The most important aircraft shown at Tushino, according to General Twining's report, was a twin-jet light bomber, code named Blowlamp by the U.S. air force. Obviously capable of high performance, this plane was considered a replacement for the IL-28 Beagle, thousands of which had been built over the past eight years.

Two new models of Yakovlev's Flashlight-type fighters also made their debut at Tushino. One of these was an all-weather fighter, with finely profiled engine nacelles projecting well ahead of and behind the sweptback wings. Presumably, this was to be a direct replacement for the Yak-25. The other apparently was designed for photo-reconnaissance and attack functions, and featured a glassed-in nose for housing the navigator.

A giant four-engine turboprop intercontinental bomber, reportedly of Ilyushin design, but code named the Bear, was put into full service during 1956. Estimated to gross about 330,000 lb. and achieve speeds up to 650 m.p.h., the Bear was said to be capable of flying 8,000 mi. without refueling. Other new types of aircraft, or modifications of aircraft formerly known, which were displayed during the year included: the MIG-23, an improved version of the MIG-19, having two small axial-flow jet

engines in the fuselage and a very high-set tail; an assault transport, credited to the designer Oleg Antonov, but bearing a striking resemblance to Stroukoff's U.S.-built C-123; and several helicopter types, including the Yak-24 (Flying Boxcar) Horse, the largest rotary-wing aircraft in squadron service anywhere.

In April, the U.S.S.R. had approximately 17,000 aircraft in combat units, including 3,000 shore-based planes to support fleet units; also 3,000 transports, according to testimony given by General Twining before the U.S. House Military Appropriations subcommittee.

Great Britain.—An economy-minded government cut back Britain's military spending program for 1956 and cancelled numerous development and aircraft production contracts. There was mounting internal criticism of the government's policy, with many officials, aviation experts and publications voicing the fear that the country was being saddled with obsolete aircraft and rapidly becoming a fifth-place contender among the air powers of the world. With the Hawker Hunter just coming into limited service, a cutback in production of the Gloster Javelin to about 100 planes and the cancellation of several advanced fighter projects, Britain's stable of fighter aircraft held little that was in the class of the U.S.S.R.'s latest MIGs, or the United States' Century series of fighters. Cancellation of plans to build Avro of Canada's CF-105 delta-wing fighter in England left Saunders-Roe's SR-53 supersonic interceptor and English Electric's P.1 fighter the only remaining entries under development in this field.

In the bomber category, Britain's picture was a little brighter. Production of the "V" series of jet bombers, the Avro Vulcan, Handley Page Victor, and Vickers Valiant continued at a moderate pace. A limited quantity of these were turned over to the R.A.F. Bomber command and were put into operational service during 1956. English Electric's Canberra lightweight bomber continued to represent the bulk of the R.A.F.'s bomber force. Several modified and improved versions of the Canberra B.8 model and PR9 photo-reconnaissance type, appeared during the year.

Britain's aircraft engine development and production presented the brightest spot in the country's entire aviation industry. Dependable gas turbine engines of all types, ranging in power from 1,000- to 19,000-lb. thrust, were produced or under final stages of development. Newest turbines displayed at Farnborough in September included the Rolls-Royce R.B.109 Tyne, R.Co. 8 Conway by-pass and R.A.29 Avon; Bristol's 705 and 755 Proteus, BO1.12 Olympus, an Orpheus and a B.E.25 Orion; Armstrong Siddely's latest Sapphire, and de Havilland's 15,000-lb. thrust Gyron. This latter turbojet engine was updated to produce more than 19,000-lb. thrust later in the year, making it one of the most powerful engines of this type in the world.

Other military aircraft shown at Farnborough for the first time were: the Fairey Gannet 4 antisubmarine aeroplane; the Gloster Javelin T-3 trainer; Vickers Supermarine N. 113 naval fighter; Supermarine Swift Mk. 7; an armed version of the Folland Gnat; a de Havilland D.H. 110 with pointed radome nose, and a Mk. 6 Hawker Sea Hawk with underwing armament.

On March 10, a Fairey Delta 2 research plane was flown by Peter Twiss to what was then a new world record of 1,132 m.p.h.

The Royal Aircraft establishment announced in September that it had designed and built a 50,000-lb. rocket at its Westcott propulsion centre. Britain's first nuclear weapon dropped from a plane was released from a R.A.F. Valiant over Maralinga, S. Austr., during tests on Oct. 11.

France.—Expansion of the French air force and the country's aircraft procurement program moved forward at a quickened pace during 1956. Mounting unrest and outbreaks in North African colonies created an immediate need for more planes and pilot training. Consequently, in April, the French air force ordered 300 North American T-6s, 100 Beech T-11 trainers, and

Above: Ilyushin bombers, built by the U.S.S.R. for the Egyptian air force, flying in formation at an air show over Cairo, Egy., in Sept. 1956

Below: Multiple refuelling of four U.S. navy jet fighters from a R3Y-2 Tradewind transport in Sept. 1956

Above: B-52C Stratofortress on a test flight in May 1956

Left: F-104A Starfighter, claimed to be the world's fastest combat plane, shown for the first time in 1956

Below, left: T-6 Texan (above) in final flight before being retired from service as a U.S. training plane in 1956. Shown below the T-6 is the T-28 trainer which replaced it

Below, right: British Vickers Supermarine N. 113 jet fighter warming up aboard the aircraft carrier "Ark Royal" during test trials of the plane in May 1956. The N. 113 was designed to carry an atomic bomb

60 Douglas B-26s (all obsolete U.S. aircraft), plus 60 Morane-Saulnier 733 armed trainers, 48 SIPA 12 armed trainers, and 310 Max Holste M.H. 1221 Broussard light transports for ambulance work in North Africa. A large quantity of helicopters was also ordered, including 50 H-21C Vertol's, 50 S-58 and 50 S-55 Sikorsky's, and 60 Bell 47s, which were used to good advantage in the fight against guerrillas in Algiers.

In April, the minister of national defense released details of the current military aircraft orders and procurement plans. It was revealed that the government had on order 150 Dassault Mystère II fighters, of which 40 had been delivered; 253 Mystère IVs, with 128 already delivered; 375 Mystère IV Bs for delivery starting in 1957; 140 SNCASO Vautours, with orders for 210 more about to be placed; 200 SNCAN 2501 Noratlas transports, with 90 delivered to date; 183 SNCASE S.E.3130 Alouette helicopters (100 for the air force, 60 for the army, and 23 for the navy) and 60 SNCASO Djinn helicopters for the army. It was further revealed that the government was sponsoring two prototypes of the S.E.3200 heavy transport helicopter.

The French naval air service was comprised at this same time of approximately 140 carrier-borne aircraft, 7 heavy antisubmarine groups, 1 antisubmarine flying-boat group and about 380 miscellaneous aircraft, including 20 helicopters.

Marcel Dassault's Etendard II and Etendard IV (formerly designated the Mystère II and IV) jet tactical-support fighters made their first flight in July. A French air force order for 305 of these aircraft made the Etendard the first European fighter capable of supersonic speeds in level flight to be ordered in quantity.

Other military aircraft under development or first flown in 1956 included the Sud-Est X. 116 Fonceur, Breguet's 1050 Alize Dart-powered antisubmarine aeroplane, Sud-Est's S.E.212 Durandal lightweight fighter, and Sud-Ouest's S.O.9050 Trident.

France made substantial progress in the guided-missile field during the year and had four missiles in operation: the Arsenal 5201 and 5210, the SFECMAS 5103 and the CT.10 target missile. An experimental Veronique rocket was fired to an altitude of 84 mi. during summer tests.

Italy.—The Aerfer Ambrosini Sagittario II, lightweight fighter developed with the aid of U.S. funds, made its first flight May 21. Powered by two Rolls-Royce Derwent 9 engines, rated at 4,000-lb. thrust, this aircraft reached a speed of Mach .94 at an altitude of 27,000 ft. in early flights at Pratica di Mare airport near Rome. The Sagittario II was built as an experimental prototype for the Ariete, seven of which were ordered built by NATO.

In August, Fiat's G.91 tactical fighter, designed around the Bristol Orpheus engine by Giuseppe Gabrielli, made its first flight at Turin, It. Thirty of these fighters were ordered by NATO for experimental evaluation.

The Italian air force announced in August that it would sponsor construction of prototypes of the Macchi M.B.326 basic trainer and the Piaggio P.155 heavy amphibian. The government also indicated that funds for prototypes of the Agusta X-1 helicopter, the Aerfer jet target plane, and a turboprop transport would be made available at a later date.

Sweden.—Saab Aircraft Co., at Linköping, put the J 35 Draken into quantity production for the Swedish air force. A one-man all-weather interceptor, powered with a Rolls-Royce Avon engine, the Draken proved capable of speeds well above Mach 1.

In May, the Swedish air force took delivery of its last J 29 "flying barrel," and speeded up the re-equipping of its attack wings with the higher-performing J 32 Lansen. This 2-seat, all-weather fighter, powered by a Swedish-built Rolls-Royce Avon 7 engine, had a speed of more than 700 m.p.h.

German Federal Republic.—Under the U.S.-German mili-

tary aid agreement announced in 1955, and the subsequent licensing agreements with companies of other NATO nations, western Germany in 1956 started the climb back to its former role as one of the world's major air powers. In July, the German Lower House Budget committee proposed expenditures that called for the purchase of 1,741 aircraft and the establishment of an air force consisting of 2,500 flying personnel and 77,500 ground crew.

Immediate orders to Republic Aviation Corp. (U.S.) for 558 F-84F Thunderstreaks and RF-84F Thunderflashes followed in August. Orders were also placed with Britain's Armstrong-Whitworth company for 68 Hawker Sea Hawk Mk. 4 naval fighters, with Fairey Aviation for 16 Gannet antisubmarine aircraft, and later with Bristol for Sycamore helicopters.

Under licensing agreements with foreign manufacturers, many of Germany's famous old-line aircraft builders reopened their plants for business. By October, the western German defense ministry had announced orders for 671 military aircraft from German firms. These included 194 Italian Piaggio trainers from Focke-Wulf A.G. at Bremen; 360 French Fouga C.M. 170R Magister jet trainers from Flugzeugunion Sued G.m.b.H. (consisting of Messerschmitt A.G. and Heinkel A.G.); 469 German DO 27 reconnaissance planes from Dornier; and 117 French SNCAN 2501 Noratlas transports from Flugzeugbau Nord G.m.b.H., (consisting of Weserflug A.G., Hamberger Fahrzeug G.m.b.H. and Siebel A.T.G. G.m.b.H.).

The air force received its first planes in August; 29 Canadian-built T-6 Mk. IVs and 20 Piper L-18C Super Cubs, for primary training at the Landsberg air base. The German naval air arm, with planned operational bases at Jagel and Nordholz, had 20 air cadets in preliminary training at Pensacola, Fla.

Spain.—The Spanish air force had 82 jet aircraft in operation by midsummer, and was due to receive additional F-86 Sabres during the fall. Two lightweight fighter designs were under development during 1956 for ultimate production by Spanish firms. One, the HA-300, was a supersonic fighter grossing about 7,000 lb. and powered by a Bristol Orpheus with afterburner. This aircraft was an outgrowth of Spain's first jet aeroplane, the HA-200-R1 Saeta, designed by Willi E. Messerschmitt, and built by Hispano Aviación in 1955. The other, a supersonic delta-wing fighter powered by a Bristol Orpheus turbojet, was being developed by Construcciones Aeronauticas, of Madrid, with the aid of E. Heinkel. It was designated the C.H.-101.

Japan.—The first Japanese-built F-86F came off the production lines of Mitsubishi Heavy Industries Ltd., and was successfully flown in September. Under licence agreements with U.S. firms, Mitsubishi, Toyo Aircraft Manufacturing Co., Kawasaki Aircraft Co. and Fuji Heavy Industries were all building planes for the Japanese defense agency with U.S. aid and sanction.

As of July 1, the Japan self-defense forces' flying equipment consisted of 43 F-86F, 72 T-33A (including 7 Kawasaki-built), 112 T-34, 130 T-6G, 1 D.H. Vampire, 1 T-28B, 1 KAL-2 and 30 C-46 aircraft for a total of 390. The Maritime Self-Defense force had 6 P2V, 16 PV-2, 10 TBM-35, 10 TBM-3-W, 2 PBV-6A, 4 JRF-5, 11 SNJ, 1 T-34, 1 KAL-2, 3 S-55, 3 S-51 and 5 HTL aircraft, or 72 total. 1 Saab-91B Safir in the Technical Research institute, and 104 L-19, 33 L-5, 56 L-21, 1 KAL-1, 5 H-19 and 6 H-13 planes in the Ground Self-Defense force brought the total defense forces' strength to 668 aircraft of all types.

The defense agency's program for the 1957-58 fiscal year called for the creation of 3 additional air wings with 320 aircraft and 10,000 men. Three prototypes of a new Japanese light jet trainer, the T1F1 designed by Fuji, were ordered.

Bacteriology. **Synthesis of a Virus.**—Working independently, Barry Commoner at Washington university, St. Louis, Mo., and H. L. Fraenkel-Conrat and Robley C. Williams at the University of California, Berkeley, were able to obtain inert fragments of tobacco mosaic virus which, when combined, produced an active virus capable of infecting a tobacco leaf. Although this work concerned a plant virus, it heralded new approaches to the defense against virus diseases. It appeared possible to recombine viruses so that they would be unable to initiate the disease, yet would combine with host tissue cells and prevent infection by an active virus during epidemics. Such immunity would be of short duration. A more lasting, active immunity, however, might follow a series of inoculations of such synthesized viruses.

The Orphan Viruses.—With the advent of tissue culture techniques for viruses (living human or animal cells suspended in tubes or flasks of buffered nutrient solutions) it was inevitable that some viruses would be isolated for which no known disease had been established. Such viruses had been facetiously referred to as "orphans in search of a disease," hence the term "orphan viruses." During 1956 this group was more formally named enteric cytopathogenic human orphan viruses, or ECHO viruses. The members of this group were obtained from the intestinal tracts of patients with the aseptic meningitis syndrome (often diagnosed as nonparalytic poliomyelitis) as well as from healthy children in different parts of the world. Thirteen antigenically distinct viruses were described and several others were announced in preliminary reports. If and when any one of the established types should be identified as the aetiological agent of a clinically distinct disease, it would be removed from the ECHO group of viruses.

Adenoviruses.—The armed forces and the public health authorities were greatly concerned over the epidemic proportions of the upper respiratory infections occurring in military recruits. Studies of such epidemics at army and naval training stations as well as children's summer camps yielded a number of viruses serologically related to a few strains also isolated by tissue culture but from apparently healthy persons. These viruses belonged to a broad adenovirus group which produced acute infections of the respiratory and ocular mucous membranes and the regional lymph nodes. All strains possessed a common antigen demonstrable by the complement fixation test, while their type specificity was indicated by the neutralization test. The types were given numbers instead of the customary name of the kind of infection produced. The use of such terminology was expected to eliminate confusion that might arise from the fact that a single serotype could produce clinically different diseases, and conversely, that clinically similar illnesses could be produced by different adenovirus serotypes as well as unrelated agents. This and similar work since 1945 made it increasingly evident that what was often called a cold might very well have been an upper respiratory infection caused by one of any number of related and unrelated viruses.

Vaccine for a Dread Cattle Disease.—Rinderpest, although unknown in the United States, is much feared because it could slip past the nation's borders any time and is an obvious choice as a biological warfare weapon. Rinderpest is the deadliest of cattle diseases, killing 90% to 100% of the animals infected.

U.S. herds are highly susceptible to this minute virus. The agent is passed by direct contact with an infected animal or contaminated straw bedding. U.S. government scientists produced an effective vaccine by combining the chemically killed virus with an adjuvant consisting of cell material derived from *Mycobacterium butyricum*, a water-nonmiscible substance and an emulsifier. The vaccine was used successfully in Africa and Asia where rinderpest killed millions of cattle annually.

Fresh Food for the Future.—Fresh foods normally contain or are coated with numbers of bacteria proportional to the quality and extent of handling and processing they receive. The total number as well as the type of organisms involved largely determines the rate and kind of spoilage which occurs. By slowing down the metabolic processes of these bacteria with refrigeration, such foods can be preserved a little longer, but this increase in time provides a very narrow margin from the processor to the cooking pot. Antibiotics such as aureomycin, terramycin, and streptomycin were added to a number of food products, resulting in improved keeping quality. Mixed salad greens were maintained fresh twice as long when they were dipped in a solution of antibiotic before packaging as undipped greens. Similarly, traces of antibiotics lengthened the life of pasteurized milk from a few days to several weeks. Hamburger, notorious for poor keeping quality, maintained a fresh taste for more than ten days under refrigeration when just 1 part per 1,000,000 of antibiotic was added to the meat. Ten parts per 1,000,000 of antibiotic in slush-ice used in chilling poultry after dressing proved effective in hindering the development of spoilage organisms. This process was equally effective in prolonging the effective storage time of fresh fish.

The U.S. Food and Drug administration, while recognizing these advantages, also saw some disadvantages: (1) a small percentage of persons are allergic to these antibiotics and could not tolerate even small amounts in their food without severe reactions, and (2) when preservatives were added to food in the past, there was the danger of such drugs' masking poor quality and handling. Under such circumstances bacteria which do not spoil the food but could cause disease might have a greater chance of contaminating the product and even multiplying therein. Many such bacteria would not be inhibited by the concentrations of the antibiotic used. After much consideration, the Food and Drug administration granted permission for the use of 7 parts per 1,000,000 of aureomycin to remain on uncooked, dressed poultry. This ruling recognized that in the cooking process the food is rendered safe and the residual antibiotic destroyed. While this affected only poultry, the precedent was set so that it appeared only a matter of time before many other foods which required cooking would be preserved with antibiotics.

Radiation.—Although not approved by the Food and Drug administration, the preservation of food by gamma-radiation had been actively investigated since 1950. The shelf life of food was lengthened by many times. The chief disadvantages of this form of preservation were the production of off-flavours, odours and discolorations in many foods, especially meats and dairy products. Foods so affected were milk, cheese, bananas, orange juice and frankfurters. Foods which appeared to be quite acceptable following treatment were asparagus, bacon, green beans, beef liver, broccoli, Brussels sprouts, carrots, chicken, codfish cakes, pork and pork sausage. Although many products appeared satisfactory after treatment, it was expected to be at least two years before tests on the wholesomeness of such products could be completed.

Badminton.

All six titles changed hands in the third open amateur tournament of the American Badminton association, held at the St. Joseph's college field house in Philadelphia, Pa., April 4-7, 1956. Finn Kobbero, Danish star from Copenhagen, dethroned Joseph Alston of Pasadena, Calif., in the men's senior singles, 15-11, 15-8, in the final round. Judy Devlin of Baltimore, Md., regained the women's laurels she had lost to Margaret Varner in 1955 by defeating the Boston (Mass.) miss, 12-10, 11-6. Kobbero teamed with J. Hammergaard Hansen, a countryman, to capture the men's doubles and paired with Judy Devlin for the mixed doubles crown. Ethel Marshall and Beatrice Massman of Buffalo, N.Y., gained the women's doubles honours and Rupert Mee and Robert Traquair of Buffalo took the veterans' doubles.

The national junior championships were played at Detroit, Mich., March 24-26. Gary McFarlane of Lewistown, N.Y., won the boys' singles by conquering Russ Paquette of Detroit 15-10, 13-15, 15-7. MacGregor Stewart of Baltimore successfully defended the girls' title by beating Norma Slauer of Marblehead, Mass. Paquette took the boys' doubles and Misses Stewart and Slauer the girls' prize. Bill Bryant and Marcia Dotson of St. Paul, Minn., won the mixed doubles.

Eddy Choong of Malaya triumphed in the men's singles of the All-England championships at London, March 14-17. In the last round of the tournament, which drew a big field of international stars, Choong subdued Kobbero, 11-5, 15-3, 15-11. The ladies' final was an all-United States affair and Margaret Varner retained her title by halting Judy Devlin, 11-7, 11-5. Kobbero teamed with J. Hammergaard Hansen to retain doubles laurels, halting another Danish team, J. Nygaard and P. E. Nielsen, 18-14, 15-5. The Devlin sisters, Judy and Sue, carried home the ladies' doubles prize by defeating Iris Rogers and June Timperley of England, 17-18, 15-12, 15-12. Joseph Alston took the major prize in the finals of the Scottish Badminton union's invitation tourney at Glasgow, March 21-24. The Pasadena star defeated F. Sonnevile of Indonesia, 15-2, 13-15, 15-12, in the men's singles. Lois Alston and Miss Varner teamed to capture women's doubles.

Another important event on the sports calendar in 1956 was the invitation tournament held by the Niagara Falls (N.Y.) Country club. Canadian players captured the singles awards. Dave McTaggart, the Canadian champion, routed Don Smythe of Toronto, 15-5, 15-1, in the men's final and Jean Waring of Calgary, Alta., the Canadian women's titleholder, defeated Arleigh Hepworth of Toronto, 11-7, 12-10. Ong Poh Lim and Teik Hock of Malaya beat Kobbero and Hansen, 16-18, 15-10, 15-7, in the men's doubles. Ethel Marshall and Beatrice Massman won from the Misses Hepworth and Waring, 15-4, 15-3. (T. V. H.)

Bahama Islands.

This British colony consists of 21 inhabited and 680 uninhabited islands extending southeastward from the Florida coast for 760 mi. Area: 4,404 sq.mi. Pop. (1953 census) 84,841 (about 88% Negro); (1955 est.) 94,000. Language: English. Religion: Christian. Capital: Nassau (pop., 1953 census, 46,125), on New Providence Island. Governor in 1956, Earl of Ranfurly.

History.—Government revenue for 1956 was estimated at £3,758,660 and expenditure at £3,630,756. Tourism was again the colony's principal source of earnings. The sponge fisheries, wiped out by a marine plague in 1938, were reopened experimentally from January to March and were then closed for the rest of the year. Sales were good and quality said to be better than 20 years earlier. A U.S. group entered into contracts for the construction of a £12,000,000 shipyard and other works connected with the projected free port at Hawksbill creek, Grand Bahama; the same group formed a company to build and operate a chemical lime plant. In February the house of assembly unanimously passed a

motion condemning colour discrimination in public places; all hotels agreed to drop the colour barrier. At a general election in June a party system appeared for the first time when six candidates of the left-wing Progressive Liberal party were returned. A substantial number of the 21 "white independents" elected later combined to form a Conservative party. One independent supporting the Progressive Liberal party and one member of the Bahamas Democratic league completed the new house.

(R. H. Y.)

Education.—Schools (1954): primary 180, pupils 21,366; secondary 7, pupils 1,076; technical 1, pupils 403; 1 teachers' training college, with 62 students. Higher education: Queen's college, St. Francis Xavier's academy, St. John's college, Long Island Christian institute.

Finance and Trade.—Monetary unit: pound sterling=U.S. \$2.80. Budget (1955 est.): revenue £3,522,000; expenditure £3,167,000. Foreign trade (1955): imports £10,860,000; exports £1,080,000. Main exports: pit props, timber, crawfish, salt, okras, tomatoes.

Bahrein: see PERSIAN GULF STATES.

Baking Industry. The following statistics on the production of the wholesale segment of the U.S. baking industry compare the 1954 tonnage (published in 1956) with the 1947 tonnage, the latter figures being the most recent census of manufactures. These figures are only for the wholesale segment of the industry, bakers selling their products through grocery stores, hotels, restaurants and institutions. Retail bakers, multiple-unit retailers and house-to-house bakers are excluded since they are not included in the annual survey from which the figures are taken.

Wholesale Production of Bakery Goods in the U.S.

Product	(In pounds)	1954	1947
Bread, white pan		8,615,290,000	8,521,157,000
Bread, white hearth		252,820,000	306,117,000
Whole, cracked and other dark wheat breads		996,029,000	893,411,000
Rye, including pumpernickle		620,278,000	613,391,000
Rolls, bread type		1,501,624,000	942,791,000
Sweet yeast goods		642,610,000	612,328,000
Soft cakes		1,034,748,000	1,210,207,000
Pies		692,633,000	600,641,000
Cookies		52,385,000	80,596,000
Doughnuts		344,662,000	309,591,000

Source: Bureau of the Census, Department of Commerce.

Tonnage figures indicate that sales of white bread were up 3.7% for 1955 compared with 1954; other breads increased 1.6%, sweet goods 2.1%, cake .8%, pie 3.1% and doughnuts 1.5%. About 65% more prepared frozen dessert pies were produced in 1955 than in 1954. The estimated output was 44,762,473 lb. as against 27,195,745 lb. in 1954. The volume of frozen baked products was up 12%. Bakery use of sugar was up 11% in 1955 over 1954.

The total number of workers in U.S. bakeries during May 1956 was 290,100, compared with 284,000 in May 1955; production workers numbered 172,100 compared with 171,200 in 1955. Average weekly earnings for bakery employees were \$73.67 compared with \$68.97; hourly earnings averaged \$1.81 as against \$1.70. Average hours worked per week were 40.7 as compared with 41.1 the previous year. In the biscuit, cracker and pretzel group, weekly earnings averaged \$65.51 as against \$62.96; weekly hours were 39.7 compared with 40.1 and hourly earnings \$1.65 compared with \$1.57.

Experiments with atomic irradiation for bread preservation tended to show that irradiated bread would not mold but would get stale. It was also found that a too-high rate of irradiation spoils the flavour. The best results from irradiation were obtained with the "brown-and-serve" type of products. The life of these items was extended and rolls retained their flavour and freshness. However, general use of the process was thought to be at least 10 years away.

The "Better Breakfast" campaign, designed to stimulate the demand for bakery products, was repeated in 1956 with increased momentum. Mayors of several large cities joined the program and

proclaimed "Better Breakfast Week" in their communities. The "July Is Picnic Month" promotion was also repeated in 1956 and a "National Sandwich Idea" contest to promote the use of bread was jointly sponsored by the Wheat Flour institute and the National Restaurant association.

Baltimore. Baltimore, the metropolis of Maryland, had 949,708 inhabitants according to the 1950 census, when it was the sixth largest U.S. city. On July 1, 1956, its estimated population was 966,000. The land area of the city is 78.7 sq.mi.; the water area, 13.2 sq.mi. Mayor in 1956: Thomas D'Alesandro, Jr., Democrat.

Budget appropriations for 1956 were \$192,152,430.83; for 1955 they were \$183,436,904.48. The city tax rate for 1956 was \$3.13 per \$100 of assessed valuation; the rate for 1955 was \$3.05. The taxable basis for 1956 was \$3,093,173,138, for 1955, \$2,936,005,029. The gross funded debt as of June 30, 1956, was \$295,536,900; the sinking funds amounted to \$29,207,127, leaving a net debt on that date of \$266,329,773, not including accrued income. The percentage of net debt to the taxable basis (excluding self-supporting indebtedness) was 5.54% as of June 30, 1956.

The net enrolment on Oct. 31, 1955, in the public schools of the city was 149,783 students; in addition, approximately 25,000 students were enrolled in adult education classes. John H. Fischer was superintendent of the Baltimore city schools. The public schools of Baltimore are a separate and distinct unit and are not under the jurisdiction of the state department of education. The integration of schools for white and Negro students had been carried into effect in Sept. 1954.

Ranking as the second U.S. port in foreign trade tonnage, Baltimore had a combined volume of exports and imports during the year 1955 amounting to 25,619,150 tons, an increase of 34.3% from the 19,076,087 tons for the previous year. The large gain in foreign trade volume resulted from substantially increased exports of coal and grain and imports of metallic ores during the year. The port's foreign commerce in 1955 was valued at \$973,000,000, as against \$968,300,000 in 1954. New port records were established in 1955, when 5,369 ocean-going vessels in all categories of water-borne trade arrived at Baltimore and 4,278 deep-draught ships utilized the Chesapeake and Delaware canal route to and from the port.

Baltimore's output of manufactured products was at a record high during 1955. Industrial employment in the area increased steadily throughout the year, averaging 2½% higher than in 1954. During the first half of 1956, it showed a continuing month-to-month gain, reaching a peacetime high of 206,400 workers in June.

At the midpoint of 1956, the 10 leading industry groups, in order of volume of employment, were primary metal industries (42,700), transportation equipment (40,200), food and kindred products (21,400), apparel (15,900), fabricated metal products (14,300), chemicals (10,300), printing and publishing (9,700), nonelectrical machinery (9,100), electrical equipment (8,300), and stone, clay and glass products (6,300).

Baltimore's marked growth in new production facilities continued in 1955 with a total announced investment of more than

\$263,000,000 for new plants and expansions. The increase in the local manufacturing capacity was greatly accelerated during the first seven months of 1956, when the announced investment for such purposes amounted to \$286,000,000, a sum that far exceeded the total for any full year in the history of the community.

(C. N. E.)

ENCYCLOPÆDIA BRITANNICA FILMS.—*The Baltimore Plan* (1953).

Bananas: see FRUIT.

Banking. Demands for credit and capital funds generally were extremely high in the United States in 1956, as they had been during the previous year. Corporate security offerings, commercial and industrial loans and state and municipal security offerings were especially strong, with some declines in mortgage financing and instalment credit financing. The federal reserve system continued to pursue a monetary policy of severe restraint. Interest rates, both bond yields and short-term money market yields, rose during 1956 to the highest levels in about a quarter of a century.

Tight Money and Credit Squeeze.—Sharply rising interest rates and lessened availability of credit featured banking developments during 1956. Over-all demands for credit and capital were at record high points. State and municipal offerings in the first nine months of the year reached a total of \$4,050,000,000 as compared with \$3,974,000,000 in the corresponding period a year before. Moreover, municipal bond approvals in the November election were reported in an amount exceeding \$2,300,000,000, thus indicating continued high levels of state and local bond flotations.

The increase in total mortgage debt on nonfarm one- to four-family houses during the first nine months of 1956 was \$8,500,000,000 as compared with \$9,800,000,000 during the corresponding months of 1955, which had been a record period for mortgage financing. The dollar amount of nonfarm mortgages of \$20,000 or less recorded for the first nine months of 1956 was 5% below the same period of 1955, but 26% above the corresponding period of 1954. Likewise, the increase in instalment credit during 1956 was somewhat less than in 1955. The rise in total consumer credit from January through September 1956 was \$1,500,000,000 as compared with \$3,900,000,000 in the corresponding period a

BANKING BY TELEVISION introduced at the Mechanics and Farmers Savings bank, Bridgeport, Conn., in 1956. Two-way screen and speaker arrangement permitted the customer, in his automobile, and the teller, in the bank, to see and talk to each other throughout the entire transaction

year earlier. These declines in demands for funds from the mortgage area and consumer credit area slightly cushioned the effect of the record business demands for funds during the year. Moreover, the federal cash surplus totalled \$10,400,000,000 during the first nine months of calendar year 1956 as compared with \$3,300,000,000 in the first nine months of 1955. As a result, during that period in 1956 the government was able to make net cash repayment of borrowing in the amount of \$8,433,000,000.

Business Demands for Credit and Capital.—The demand for bank loans by business enterprises was enormous. The net increase in commercial and industrial loans at all weekly reporting member banks was \$3,206,000,000 in the last six months of 1955 and \$2,243,000,000 in the first six months of 1956. Business expenditures for plant and equipment rose from a record level of \$29,700,000,000 in the third quarter of 1955, annual rate seasonally adjusted, to an extraordinary peak of about \$38,000,000,000 in the fourth quarter of 1956. In addition, the book value of inventories of manufacturing and trade firms at the end of Sept. 1956 was \$6,500,000,000 greater than a year previous. Moreover, corporations made heavy income tax payments in the first six months of 1956 as a result of stepped-up schedules for payment and record 1955 levels of corporate profits. As a result, business firms experienced a major decline in holdings of cash and U.S. government securities in the first half of 1956 and were forced to borrow heavily in the credit and capital markets. In the first six months of 1956 government security holdings of corporations were reduced net by \$6,000,000,000 as compared with a reduction of only \$500,000,000 in the first six months of 1955. While internal financing, retained profits and depreciation charges in total were at record levels during 1956, these sources of funds failed even to cover plant and equipment outlays. Corporations, therefore, found it necessary to make record offerings of corporate securities in the capital markets.

Total corporate offerings of new securities in the first nine months of 1956 were \$7,932,000,000, about 9% greater than in the same months a year before. Such offerings during 1955 had reached a new peak of \$10,240,000,000. Offerings of bonds during the first nine months of 1956 totalled \$6,155,000,000 of which about 54% were publicly offered and 46% privately offered. During the same period offerings of preferred stock totalled \$434,000,000, and offerings of common stock totalled \$1,342,000,000.

The net change, that is, new issues less retirements, in outstanding corporate securities totalled \$7,223,000,000 during 1955. Of this amount, \$4,513,000,000 took the form of a net increase in outstanding bonds and notes and \$2,710,000,000 was in the form of a net increase in stocks. The net increase in outstanding corporate securities, including bonds and notes and stocks, was in turn about 20% greater in the first half of 1956 than in the first half of 1955.

Interest Rates.—During 1956 the combination of high demands for funds, the portfolio position of institutional investors and restrictive federal reserve policies brought about sharp advances in interest rates and falling bond prices. Short-term interest rates moved up sharply and spreads between interest rates in the maturity structure became the lowest since the early 1930s. The yield on new issues of three-month treasury bills went up from a low of 2.17% late in March to a 23-year high at 3.17% late in Nov. 1956. The rate on prime commercial paper, 4 to 6 months, rose from 3% early in the year to 3½% in October and November.

In the corporate bond market the yield on Moody's (investors service) average of Aaa corporate bonds rose from a low of 3.07% early in the year to 3.73% late in Nov. 1956. This com-

pared with annual ranges of 3.44% to 2.98% in 1953, 3.11% to 2.85% in 1954, and 3.18% to 2.91% in 1955.

Yields on long-term treasury bonds rose and prices fell sharply during 1956. The long-term 3½% government bonds dropped from a high of 106½ early in 1956 to a low of about 98 late in the year, at which price the yield was 3.37% to maturity. The 3% bond due in 1955, a 40-year maturity, offered in 1955, went down from about 101 to a low of about 93, to yield about 3.32%.

The municipal market was particularly hard-hit by stringency in money market conditions. The yield on Standard and Poor's average of high-grade municipals rose from a low of 2.55% early in the year to a high of 3.45% late in November. This was the highest level of yields and the lowest level of bond prices on municipal bonds since the late 1930s.

Mortgage credit also encountered a particularly tight situation. Discounts in the secondary market rose and serious difficulty was encountered in obtaining funds. Early in December the Federal Housing administration raised the basic rate on FHA-insured mortgages from 4½% to 5%, and the Veterans administration announced that it might ask congress for authorization to increase the rate correspondingly on GI-insured home loans.

Commercial Banks.—Total loans and investments of all commercial banks reached a new peak in the second half of 1956, amounting to \$162,100,000,000 on Sept. 26, 1956. The increase in bank earnings assets during 1956 was somewhat less even than during the previous year, however, as restrictive federal reserve policies continued forcing commercial banks to sell government securities in an amount which provided much of the funds to permit a substantial increase in loans. Total loans reached a new record peak of \$88,500,000,000 at the end of Sept. 1956, after a nine-month increase of \$5,900,000,000 and a rise of \$10,100,000,000 over the end of Sept. 1955. Commercial bank holdings of government securities on Sept. 26, 1956, amounted to \$57,000,000,000, a decrease of \$4,600,000,000 since the beginning of the year. Other securities, chiefly holdings of state and local governments, stood at \$16,500,000,000 on Sept. 26, down \$200,000,000 during the nine-month period. Thus, the increase in total loans and investments at all commercial banks was \$4,800,000,000 in the year ended Sept. 1956 and was only \$1,200,000,000 during the first nine months of the year.

On June 30, 1956, national banks, which numbered 4,667, held \$100,826,000,000 of total deposits. State banks, which numbered about 9,000, had total deposits of \$85,525,000,000.

Total earnings of commercial banks in 1956 were well above the previous year, reflecting a continuing increase of earnings on loans with a slightly lower level of earnings on government securities. Although current expenses increased, net current earnings were higher, as were dividends.

The Bank Holding Company act of 1956 was approved May 9, 1956. Pursuant to that act the board of governors of the federal system issued Regulation Y, effective Sept. 1, 1956, providing for registration of bank holding companies, limitations on size and extent of bank holding company systems, and divestment of interest in nonbanking organizations.

Money Supply.—The privately held money supply reached a new record peak, with allowance for seasonal change, on Sept. 26, 1956, at \$214,200,000,000, including demand deposits adjusted, \$105,400,000,000; time deposits at commercial banks, mutual savings banks and the postal savings system, \$81,200,000,000; and currency outside banks, \$27,500,000,000. The increase over the figure of a year before was \$4,500,000,000, with the rise coming primarily in time deposits. In the year ended Sept. 1956 the increase in demand deposits adjusted was only \$600,000,000 and the increase in currency outside banks was \$300,000,000.

Money in circulation, that is, currency and coin outside the treasury and federal reserve banks, showed little change other than seasonal during the year, with a net increase of only about \$300,000,000.

The volume of bank debits at commercial banks and the rate of demand deposit turnover rose to new record heights reflecting further expansion in the economy. Debits to demand deposit accounts at banks in 343 leading centres in the third quarter of 1956 were 6.4% above the total reported for the corresponding period a year before. Likewise, the annual rate of turnover or velocity of demand deposits, which indicates the rate at which people and business enterprises spend their "check book money," reached new highs in the summer of 1956, but later flattened out with only minor year-to-year gains recorded. (J. K. L.)

Mutual Savings Banks.—For a second time since the close of World War II the combined assets of all mutual savings banks in the United States increased by more than \$2,000,000,000 in a 12-month period. The net gain in these combined assets for the year ended June 30, 1956, was \$2,042,152,481 or 6.70%, bringing total assets at the end of the period to \$32,502,979,754. This compared with a net gain in combined assets of \$2,063,836,641 or 7.27% during the year ended June 30, 1955. The funds on deposit increased in amount by \$1,856,131,095 or 6.81% in the year ended June 30, 1956, to a total on that date of \$29,185,222,811. The increase in deposits for the year ended June 30, 1955, was \$1,891,197,342 or 7.43%. Surplus funds on June 30, 1956, amounted to \$2,930,308,819, or slightly more than 10% of the amount due depositors. There were 21,241,264 depositors being served by mutual savings banks on June 30, 1956, an increase of 398,636 or 1.91% during the year ended that date, compared with an increase of 349,451 or 1.70% in the previous 12-month period.

The number of mutual savings banks in the United States remained at 527 on Sept. 30, 1956, but the number of branches in operation increased to 347 from 320 on Sept. 30, 1955.

During the year ended June 30, 1956, the average rate of dividend credited on deposits rose from 2.71% to 2.85%, higher earnings having enabled 280 of the 527 banks to credit dividends for the latest dividend period at the rate of 3% or more.

Real estate mortgage loans continued to be the chief outlet for new funds of mutual savings banks. On June 30, 1956, mortgages constituted 56.70% of the combined assets of all mutual savings banks. The remaining assets consisted of U.S. government securities, 25.59%, other securities, 12.78% and other assets, 4.93%. On June 30, 1955, the combined assets were composed as follows: U.S. government securities, 28.51%, other securities, 13.71%, real estate mortgage loans, 52.52%, other assets 5.26%.

An important factor in the ability of mutual savings banks to increase their investments in real estate mortgage loans had been the postwar banking law revisions which permitted nationwide lending, principally in loans insured by the Federal Housing Administration (FHA) and the Veterans administration (VA). A survey at the end of 1955 showed that 28% of all real estate loans were out of the state in which the lending institution was located, and such loans were for the most part government agency guaranteed.

As of June 30, 1956, the three states selling savings bank life insurance, Massachusetts, Connecticut and New York, had a combined total of \$891,110,374 of life insurance in force, covering 702,214 policies. This was a gain of \$56,293,768 and 20,151 policies in force in the year ended that date. During the same year the number of issuing banks selling life insurance increased from 93 to 94 and the number of agency banks from 185 to 187. Agency banks sell insurance as agents of other savings banks but not for their own account.

The large increase in deposits in the special investment department resulted mainly from transfers from the ordinary department in order to take advantage of the higher dividend rates, which in special investment departments ranged from 2 $\frac{3}{4}$ % to 3 $\frac{1}{2}$ %, whereas the ordinary departments paid only 2 $\frac{1}{2}$ %. (HE. BR.)

Other Countries.—Pressures imposed by the further development of the movement toward tighter official credit policies, begun in 1955, made 1956 another difficult year for banking institutions in the United Kingdom, the Commonwealth, Europe and the middle east. With inflationary pressures showing a marked tendency to persist throughout these regions, official bank rates were increased in many countries in order to raise the general level of interest rates sufficiently to discourage capital development spending. More direct measures to discourage bank financing of capital outlays taken in many countries were also widely adopted, including the banning of certain types of lending, the fixing of maximum levels for overdrafts and the enforcement of more severe rules regarding the proportion of bank resources to be employed in liquid form.

Banking turnovers had generally ceased to expand or showed much smaller increases than previously. The rise in advances and deposits was also slowed down or halted in most countries and in some cases was in some measure reversed. These developments inevitably affected the domestic finances of the banking system adversely by interrupting the previous steady expansion in business, although banks' earnings benefited considerably from the advance in interest rates. Their current account circumstances were, therefore, more favourable on balance generally than in 1955, but the depreciation of fixed interest investments, caused by the tendency for market values to fall as the general level of interest rates rose, caused continuing anxiety in some cases.

In Great Britain the official decision to raise bank rate a further 1% to 5 $\frac{1}{2}$ % early in 1956 was immediately followed by an increase of about the same order in rates of interest quoted for the general run of bank business. The efforts of the banks to reduce overdrafts were assisted during 1956 by the decision of the chancellor of the exchequer to direct the nationalized industries to satisfy their requirements of development finance from budget funds instead of covering such outgoings by borrowing from the banks pending the raising of permanent capital in the new issue market. The loans under this heading rose fairly steeply in the first half of the year, and then showed a falling tendency.

The tendency for the banks to cut advances exerted a downward pressure on their deposits. The decision of a number of them to reduce their investment holdings further, partly by sales in the market and partly by refusing to convert into new bonds maturing government securities, also tended to depress deposits. However, the inability of the government to cover the budget deficit and the repayment of loans reaching final redemption dates by long-term borrowing forced the treasury to obtain funds on a large scale from the banking system against treasury bills. In consequence, though advances and investments showed a combined fall of £300,000,000 on the year in October, deposits recorded a net contraction of only £100,000,000.

Early in the year there were substantial withdrawals of savings bank money, because higher rates were obtainable in other fields. The government's decision to give tax-free status to the first £15 per annum of interest earned by balances on ordinary accounts later stimulated a reflux of money to these institutions.

Following a further deterioration in the country's balance of payments, the Australian authorities decided to reinforce monetary measures for combating inflationary trends early in 1956. Through consultation with bank managements and manipulation of the special account procedure for freezing part of the banks' resources, the central bank induced the commercial banks to keep lending figures from rising.

The New Zealand authorities further developed the stringent monetary policy inaugurated in the previous year. A new procedure was introduced whereby the commercial banks were placed under a direct pressure to keep their total loans below a ceiling set by the central bank. The intention was to vary the banks' minimum obligatory liquidity ratios so that they could extend credit beyond the official limit only by obtaining additional liquid money from the central bank at a rate of interest exceeding that which could be earned on "excess lending."

In South Africa the banking system came under pressure early in the year, because of the movement of money to other centres to take advantage of higher interest rates and the deficit in the country's external payments. Restrictions on the movement of short-term funds and strengthening of the domestic interest rates structure eased the position. In Rhodesia a new central bank was established with powers to influence in considerable measures the activities of the commercial banking system. Private interests set up a merchant bank to promote the development of a money market modelled on that operating in the United Kingdom.

There was a sharp expansion in banking turnovers in India during 1956 and deposits and advances also rose sharply. To facilitate the financing of the second five-year program, legislation was introduced to amend the Reserve Bank of India act. In Pakistan steps were taken to strengthen the facilities provided by the state bank for the financing of agriculture.

The Canadian authorities made a series of increases in the bank rate in 1956 and also tightened liquidity requirements imposed on commercial banks and discouraged them from participating in certain forms of lending. The rise in bank deposits accordingly slowed down toward the close of the year.

Many countries, among them the German Federal Republic, the Netherlands, Finland and Turkey, made substantial increases in official bank rates to arrest the expansion in bank lending in 1956. The Greek government introduced a three-point program for co-ordinating monetary banking and credit policies and creating a unified and flexible money market. The remodelling of the German commercial banking system on prewar lines was completed and the government took steps to reshape the central bank.

In Egypt the freezing of foreign bank funds after the nationalization of the Suez canal in July made extensive rearrangement of banking business necessary.

In Israel many commercial banks introduced new types of saving schemes to help official efforts to finance development without inflation. In Libya a new bank was opened with capital subscribed by the authorities and private investors to finance development. In Syria a central bank was established and took over the functions of bank of issue previously carried out by the Bank of Syria and Lebanon, a privately owned institution.

Baptist Church. Great interest was created among Baptists of the United States by the visit during May and June 1956 of five Russian Baptists representing approximately 500,000 Baptists in the U.S.S.R. The total number of Baptists in Russia was estimated as 3,000,000—of whom 2,500,000 were not affiliated with the Union.

The Executive Committee of the Baptist World Alliance meeting in Washington, D.C., May 1956, voiced deep concern over

the continued persecution of Protestants in Colombia, and sincere regrets that the Evangelical Theological seminary in Madrid, Sp., had not been reopened. Resolutions respecting these two restrictions of religion were forwarded to the president of Colombia and the Spanish chief of state.

The American Baptist association meeting in Little Rock, Ark., June 26–28, 1956, with 3,500 attending, reported receipts of \$98,730.57 for missions and endorsed 31 interstate and foreign missionaries. Sales of publications for the year totalled \$155,604.72. Resolutions opposing the decision of the U.S. supreme court on segregation, and giving moral endorsement to the American Council and International Council of Churches were passed. Fresno, Calif., was chosen for the 1957 meeting.

During 1955 and 1956, the American Baptist convention, the National Baptist Convention, U.S.A. Inc., the National Baptist Convention of America, the North American Baptist General convention, the Baptist General Conference of America and Canadian Baptists expressed a desire to participate with the Southern Baptist convention in a five-year program to observe the 150th anniversary of the organization of Baptist work on a national level in the United States and North America. It was to begin in 1959 and close in 1964.

The Baptist General Conference of America, meeting in Waukegan, Ill., June 27 to July 1, 1956, was one of the best attended in its 77-year history. It reported 26 new churches, and that its total of 451 churches had 58,000 members and a Sunday school enrolment of 75,000.

The American Baptist convention meeting in Seattle, Wash., in June 1956, passed a resolution urging the United States government to abandon hydrogen bomb tests in the Pacific. It declared such tests harmful to missionary work, dangerous to the Japanese economy, with adverse effects on the Asiatic people and posing a long-range threat to the human race. The 1957 session of the convention was to be held in Philadelphia, Pa., and would celebrate the 250th anniversary of the founding of the Philadelphia Baptist association, the first in America; the 125th anniversary of the organization of the American Baptist Home Mission society; and the 50th anniversary of the convention itself.

The Southern Baptist convention met in Kansas City, Mo., May 30 to June 2, 1956. Its relief committee reported that for the first time in ten years it did not have sufficient funds to meet the needs of its missionaries to relieve the extreme suffering of the people with whom they worked. The Home Missions board planned to establish 1,000 new churches annually for the next three years. The 1957 convention was scheduled to meet in Chicago, Ill. (See also CHURCH MEMBERSHIP.) (R. E. E. H.)

Barbados. This British colony is the most easterly of the Caribbean islands. Area: 166 sq.mi. Pop.: (1946 census) 192,800 (77.3% Negro, 17.5% mixed, 5.1% European); (1955 est.) 230,000. Language: English. Religion: Christian (about 70% Anglican). Capital and chief port: Bridgetown, pop. (1954 est.) 18,000 (metropolitan area 80,000). Governor in 1956, Sir Robert Arundell; premier, Grantley H. Adams.

History.—In March 1956 the ministries, the secretariat and the crown law officers moved into a new block of government buildings erected at a cost of B.W.I. \$397,000 (British West Indian dollars). Legislation to aid hotels was enacted exempting from import duty materials to be used in the building of new hotels or the extension of those already existing. Certain income tax concessions were also granted to new hotels. Grants totalling B.W.I. \$2,020,800 from colonial development and welfare funds were approved to assist with the development of the water resources of the island, the tenantry road program, the erection of a third health centre and the extension of the runway and terminal building at Seawell airport. The regional police

training school to train recruits from the Leeward and Windward islands and Barbados began operations in November. Plans were prepared for the erection of a new 600-bed hospital estimated to cost B.W.I. \$3,331,000.

The Federal Capital fact finding commission visited the island in June.

In the elections for the house of assembly held in December, the Barbados Labour party gained 15 of the 24 seats, and the leader of the party, Grantley Adams, who was premier during the previous session, was again invited by the governor to form a government.

(D. A. Ws.)

Education.—Schools (1954): public elementary 124, pupils 33,697, government-aided secondary 10, pupils 3,086. Higher education: Codrington college (affiliated to Durham university, Durham, Eng.), students 28; Erdiston teachers' training college, students 32; Barbados evening institute; the technical institute in St. Michael opened in 1955.

Finance and Trade.—Monetary unit: British West Indian dollar, B.W.I. \$1.7=U.S. \$1. Budget (1955 est.): revenue £3,116,000; expenditure £3,514,000. Foreign trade (1955): imports £11,500,000, exports £8,090,000. Principal exports: sugar, molasses, rum. Sugar crop (1954): 171,000 metric tons.

ENCYCLOPÆDIA BRITANNICA FILMS.—*Caribbean* (1955).

Bardeen, John (1908—), U.S. physicist, received the 1956 Nobel prize in physics jointly with Walter H. Brattain and William B. Shockley (*qq.v.*) for perfection of the transistor in 1948. The three—members of a research team at the Bell Telephone laboratories in Murray Hill, N.J.—shared a cash prize of \$38,633 provided under terms of the will of Alfred Nobel. Announcement of the winners' selection by the Swedish Academy of Sciences was made at Stockholm on Nov. 1, 1956.

Bardeen was born at Madison, Wis., May 23, 1908, and received his bachelor's and master's degrees from the University of Wisconsin, and his Ph.D. from Princeton university. He was a geophysical engineer for a petroleum research corporation from 1930 to 1933, taught physics at the University of Minnesota from 1938 to 1941, and was head physicist of the U.S. naval ordnance laboratory in Washington, D.C., for the next four years. From 1945 to 1951 he was associated with the Bell Telephone laboratories where he, Shockley and Brattain developed the transistor, a minute semiconductor that found wide application in electronics as a substitute for the conventional vacuum tube in a multitude of communications and industrial devices. In 1951 Bardeen joined the faculty of the University of Illinois as professor of physics and electrical engineering. In 1952 he was recipient of the Balmain medal of the Franklin institute.

Barley. The 1956 U.S. barley crop, indicated at 370,254,000 bu., was the fourth largest of record, much larger than the 278,166,000-bu. average for 1945–54 but smaller than the 400,295,000-bu. crop of 1955. Harvested acreage, somewhat reduced by drought in portions of the Great Plains, was 12,867,000 ac., as compared with 14,553,000 ac. in 1955 and an average of 10,443,000 ac. for the decade 1945–54. The indicated yield of 28.8 bu. per acre was high, as compared with 27.5 bu. in 1955 and a 26.6-bu. average for 1945–54. North Dakota, as in 1955, was the leading producer (72,521,000 bu.), closely followed by the usual leader, California (69,844,000 bu.), and by Minnesota (28,280,000 bu.) and Montana (27,710,000 bu.).

The official support price of 92 cents per bushel for grade 2 better, as announced in February, was later increased to \$1.02, 76% of parity. Prices at harvest time to the producer averaged about 95 cents per bushel, nearly the same as in 1955. Heavy feeding use and record high exports (97,600,000 bu.), largely to Europe and Japan, took a record 440,900,000 bu. during 1955–56, about 98,800,000 bu. more than in 1954–55 and much more than average. Imports were nearly 25,000,000 bu. Carry-over on July 1 was 114,800,000 bu., 12% smaller than in 1955.

Estimated barley stocks in principal exporting countries as of

Barley Production of the Principal Producing Countries

(In thousands of bushels)

Country	1956*	1955	Average 1945–49	Average 1935–39
U.S.S.R.			272,000	425,000
United States	370,254	400,295	273,306	238,622
China			322,244	347,000
Canada	278,000	252,225	141,171	88,882
France	252,610	122,680	52,500	53,004

Japan	96,500	99,020	56,046	73,113

*Preliminary estimate.

July 1, 1956, were at a record high of 314,000,000 bu., as compared with 267,000,000 bu. a year earlier. The 1956 world barley crop was estimated at 3,290,000,000 bu., as compared with 3,080,000,000 bu. in 1955 and only 2,375,000,000 bu. average pre-World War II. The increase was particularly marked in western Europe where winter-damaged fall sown grains were replanted with barley. World acreage expanded to 139,750,000 ac. as compared with 135,650,000 ac. in 1955 and only 117,420,000 ac. average prewar.

(J. K. R.)

Baseball. The first perfect game in world series history dwarfed all other baseball developments in 1956. Donald James Larsen of the New York Yankees, a 27-year-old righthander whose pitching career hitherto had reflected only mediocrity, won everlasting fame on Oct. 8 in the fifth game of the postseason classic. He stunned the Brooklyn Dodgers, 2 to 0, at Yankee stadium by retiring 27 successive batters on 97 pitches. No one reached first base off Larsen, whose unusual pitching style found him throwing without a windup. Larsen needed only one run for a working margin and centrefielder Mickey Mantle supplied it in the fourth inning with a home run. Another Yankee run in the sixth inning proved to be superfluous. The victim of Larsen's masterpiece was 39-year-old Brooklyn pitcher Sal Maglie. His five-hitter deserved a better fate, but on this day, baseball had room for but one hero.

Weighing all factors, Larsen effected the finest individual baseball performance of all time. The last perfect game in the major leagues was posted by Charlie Robertson of the Chicago White Sox against Detroit in 1922. Five men before Robertson also had pitched perfect games in regular-season play. But Larsen alone created his miracle amidst the pressure of a world series. His triumph gave New York a 3 to 2 lead in the series and the impetus to move on to its 17th world championship in 22 series appearances. Elsewhere on the baseball front in 1956, the lucrative franchise of the Detroit Tigers changed ownership.

On July 16, an 11-man syndicate headed by Michigan radio-television executives Fred Knorr and John Fetzer bought the Tigers and Briggs stadium from the Briggs estate for a record price of \$5,500,000. The sale became effective on Oct. 1. Club president Walter (Spike) Briggs, Jr., was retained as executive vice-president and general manager.

On July 23, Hank Greenberg, former Detroit and Pittsburgh first baseman, and Joe Cronin, erstwhile shortstop for Washington and the Boston Red Sox, were initiated into the Hall of Fame at Cooperstown, N.Y.

Cronin, general manager of the Red Sox, figured in the news again on Aug. 7 when he fined outfielder Ted Williams \$5,000 for an outburst of temperament toward fans and sports writers during a game against the Yankees.

Major League Races.—The National league pennant race was undecided until the final day of the season. Brooklyn finally won out by a scant one-game margin over Milwaukee. Cincinnati, in third place, was only two games back. In one of the most exciting finishes in recent years, Milwaukee held a one-game edge over the Dodgers with three games left to play for both clubs.

CATCHER LARRY (YOGI) BERRA leaping into the arms of pitcher Don Larsen after Larsen pitched a perfect game (no hits, no runs, no man to reach first base) for the New York Yankees in the 1956 world series. Larsen's feat was the first no-hitter in series history and the first perfect game since 1922 in the major leagues

The Braves, however, dropped two games to St. Louis while Brooklyn was sweeping three games from Pittsburgh.

In the American league, the New York Yankees turned on the pressure in the final half of the season to breeze home with a comfortable nine-game edge over runner-up Cleveland. The Yankees brought Manager Casey Stengel his seventh flag in the past eight years. The Chicago White Sox, 12 games behind, nosed out the Boston Red Sox for third place by one game.

Table 1.—Final Major League Standings, 1956

Standing at close of season, Sept. 30				Standing at close of season, Sept. 30			
Natl. League	Won	Lost	Pct.	Amer. League	Won	Lost	Pct.
Brooklyn	93	61	.604	New York	97	57	.630

World Series.—The New York Yankees and Brooklyn Dodgers, world series rivals in 1955, took up where they left off to bring a stirring climax to the 1956 baseball season. The defending champion Dodgers threatened a runaway by winning the first two games at Ebbets field.

Sal Maglie, magnificent in the clutch for Brooklyn during the regular season, tamed the Yankees and Whitey Ford in the opener, 6 to 3. Maglie gave up nine hits and struck out 10. He surrendered a two-run homer to Mickey Mantle in the first inning but Brooklyn, aided by Jackie Robinson's home run, tied the score at 2-2 in the second. Gil Hodges' three-run blast decided

the game for the Dodgers in the third inning.

In the second game the Yankees piled up a 6 to 0 lead but were defeated by a final margin of 13 to 8. New York scored once in the first inning and added five runs in the second, with four runs resulting from Yogi Berra's grand slam homer off Don Newcombe. But Yankee starter Don Larsen failed to hold the advantage. In the Brooklyn second, an error by first baseman Joe Collins paved the way for six unearned Dodger runs, the last three on Duke Snider's tenth series home run. Hodges' two-run double in the fourth put the Dodgers ahead to stay. The winner in a sterling relief job, was Don Bessent. Another relief pitcher Tom Morgan, suffered the loss.

When the teams switched to Yankee stadium for the third game, the tide of battle changed. Manager Casey Stengel of the Yankees came back with Ford in a desperation move while Walter Alston, the Brooklyn pilot, countered with Roger Craig. The Dodgers led, 2 to 1, going into the Yankee sixth, but 40-year-old Enos Slaughter ruined Craig's plans with a three-run homer. New York went on to win, 5 to 3.

Tom Sturdivant kept the revived Yankees rolling in the fourth game with a six-hit, 6 to 2 victory. A key single by Billy Martin off loser Carl Erskine helped the Yankees snap a 1-1 tie with two runs in the fourth inning. Mantle and Hank Bauer homered subsequently to provide insurance runs for Sturdivant. The series was now tied.

The fifth game belonged to Larsen and the Yankees, 2 to 0, but the Dodgers refused to be counted out.

In the sixth game, Brooklyn returned to Ebbets field and knotted the series at three games apiece. Clem Labine, normally a bullpen pitcher, outduelled Bob Turley, 1 to 0, in 10 innings. Turley allowed only four hits but lost out when Slaughter, in left field, misjudged Robinson's sinking line drive in the bottom of the tenth. Robinson's blow, which was scored as a single, brought Junior Gilliam home from second base. Labine posted a seven-hitter.

Brooklyn sent Newcombe against 23-year-old Johnny Kucks in the seventh and final game and the Yankees made a shambles of it, 9 to 0. Kucks brilliantly held the Dodgers at bay on three hits. Yogi Berra doomed Newcombe hurriedly with a two-run homer in the first inning and another homer in the third. When Elston Howard also homered off Newcombe in the fourth, the towering right-hander was removed, thus deprived of a possible series win for the fifth time in as many starts. Bill Skowron completed the rout in the seventh inning when he slammed a bases-loaded homer off Craig.

New York thus gained its revenge over Brooklyn and won the series for the sixth time in eight years.

Individually, Berra showed the way for the Yankees with a .360 batting average. The durable catcher also drove in a series record total of 10 runs. Slaughter, purchased by the Yankees from Kansas City on Aug. 25, followed Berra with an average of .350.

Snider and Hodges set the pace for Brooklyn with .304. The Dodgers batted .195 as a team, however, collecting only one run and seven hits in the final three games.

Attendance for the seven games was 345,903 and the net receipts were \$2,173,254.59. The Yankees voted 32 full shares worth \$8,714.76. The Dodgers voted 28 full shares worth \$6,934.34 to become the richest series losers in history.

Individual Performances.—Mickey Mantle of New York won the triple crown of batting in the American league. Mantle hit 52 home runs, 8 shy of Babe Ruth's record 60, and drove in 130 runs while compiling an average of .353. Ted Williams of Boston hit .345.

In pitching, Whitey Ford of New York led earned run averages with 2.47. His record was 19-6. The 20-game winners included

Frank Lary (21-13) and Billy Hoelt (20-14) of Detroit; Billy Pierce (20-9) of Chicago; and Herb Score (20-9), Early Wynn (20-9) and Bob Lemon (20-14) of Cleveland. Mel Parnell of Boston pitched a no-hit, no-run 4 to 0 victory over Chicago on July 14.

Milwaukee's Hank Aaron won the National league batting title with .328. Brooklyn's Duke Snider topped the home run parade with 43 while Stan Musial of St. Louis led in runs batted in with 109.

Dale Long of Pittsburgh broke a major league record by hitting home runs in eight consecutive games from May 19 through May 28.

The earned run leader among National league pitchers was Lew Burdette of Milwaukee, with a 2.71 average on a record of 19-10. Brooklyn's Don Newcombe was the big winner with 27-7. Warren Spahn (20-11) of Milwaukee and Johnny Antonelli (20-13) of New York were the only other 20-game winners.

Brooklyn pitchers Carl Erskine and Sal Maglie accounted for both National league no-hitters. Erskine got the second no-hitter of his career when he beat the Giants, 3 to 0, on May 12. Maglie waited until Sept. 25 to no-hit the Philadelphia Phillies, 5 to 0.

All-Star Game.—The National league defeated the American league, 7 to 3, to capture the 23rd annual All Star game at Griffith stadium in Washington, D.C., on July 10. It was the 10th victory for the Nationals against 13 reverses. Each club totalled 11 base hits, but the National league ran up a 5 to 0 lead, then beat back a three-run uprising in the sixth inning that featured home runs by Ted Williams and Mickey Mantle. Willie Mays and Stan Musial both homered for the Nationals. Third baseman Ken Boyer of the National league stood out defensively and also contributed three hits. The National league line-up at the outset included five members of the Cincinnati Redlegs. The winning pitcher was Bob Friend, who started against Billy Pierce, the loser. The game attracted 28,843 patrons.

Managerial Changes.—The lone managerial change in the majors during the season came on June 16, when Charley Grimm resigned as Milwaukee manager. Fred Haney, a coach with the Braves, took over for Grimm.

Upon conclusion of the season, the Chicago Cubs underwent a drastic shake-up. Manager Stan Hack, personnel director Wid Matthews and business manager Jim Gallagher all resigned. Bob Scheffing, who had managed the Cubs' affiliate at Los Angeles, became field manager; John Holland, president of the Los Angeles club, and Charley Grimm were named Cubs' vice-presidents. Another Cub's vice-president, Clarence Rowland, was named president at Los Angeles. Meanwhile, manager Al Lopez resigned at Cleveland and took a similar post with the White Sox when Marty Marion left Chicago. Kerby Farrell was named manager for Cleveland. Another postseason change found Detroit replacing manager Bucky Harris with Jack Tighe, who had coached under Harris.

Player Deals.—One of the key transactions of the 1956 season, as matters developed, came on May 15 when Cleveland received waivers on pitcher Sal Maglie, who then joined Brooklyn and aided immeasurably in the Dodgers' pennant

rush. Maglie won 13 of 18 decisions.

Among the multiplayer trades, the St. Louis Cardinals sent pitchers Harvey Haddix, Stu Miller and Ben Flowers to Philadelphia on May 11 for pitchers Herman Wehmeier and Murry Dickson. On June 14, the Cardinals traded second baseman Red Schoendienst, outfielder Jackie Brandt, catcher Bill Sarni and pitcher Dick Littlefield to the Giants for shortstop Alvin Dark, outfielder-first baseman Whitey Lockman, catcher Ray Katt and pitcher Don Liddle.

The White Sox, on May 21, got pitcher Jim Wilson and outfielder-first baseman Dave Philley from Baltimore in exchange for third baseman George Kell, outfielder Bob Nieman and pitcher Mike Fornieles.

Attendance.—As a result of its tight pennant race, the National league enjoyed an increased attendance of 960,398 over 1955. The final count for 1956 was 8,634,810. Milwaukee topped the 2,000,000 mark for the third straight year. The American league fell off 1,058,913 from 1955 to a total of 7,884,058, principally because of the Yankees' runaway.

Table II.—Attendance at Major League Baseball Parks, 1956

Club	1956	1955	Club	1956	1955
National league			American league		
Milwaukee . . .	2,046,331	2,005,836	New York . . .	1,491,594	1,490,138
Brooklyn . . .	1,199,775	1,033,589	Boston . . .	1,137,158	1,203,200

The Minor Leagues.—Table III reveals the pennant and play-off winners in the minor baseball leagues during 1956. (J. BE.)

Boys' Baseball.—Tom Jordan, Jr., pitched and batted the Roswell (N.M.) nine to the title in the 1956 Little League world series at Williamsport, Pa. With 12,000 watching the final on Aug. 24, Jordan hit a home run with two on bases in the fourth inning to give his team a 3-1 victory over Delaware Township, N.J. Jordan fanned 14 batters and allowed two hits in the 6-inning game. Winchester, Mass., beat Colton, Calif., 2-1, in the consolation contest. Trenton, N.J., captured the championship of the Babe Ruth league series at Portland, Ore., winning over Huntington Park, Calif., 1-0.

Joliet, Ill., came out on top in the double elimination tourney of the Pony (Protect Our Nation's Youth) league at Washington, Pa. Ed Stonich, gaining his second victory in the series,

Table III.—Final Minor League Winners, 1956

Class	League	Finished first	Parent club	Won play-offs	Position	Parent club

FIRST PITCH of the 1956 All-Star game, Johnny Temple of the Cincinnati Redlegs waiting for the delivery by Billy Pierce of the Chicago White Sox

clinched the title by halting Hamtramck, Mich., 9-1. Jim Bradley of Hamtramck had hurled the first no-hitter in Pony series history in blanking New Brunswick, N.J., 1-0, in a semi-final. The American Legion junior tournament at Bismarck, N.D., was won by Stockham Post of St. Louis, Mo. The post, which had competed every season since 1926, gained the crown by conquering New Orleans, La., 8-3, in the last round. Tacoma, Wash., routed East Chicago, Ind., 10-0, at Battle Creek, Mich., to win American Amateur Baseball congress honours. Gloucester City, N.J., beat Gastonia, N.C., 9-0, in the National teenagers' tourney sponsored by the Veterans of Foreign Wars.

College Baseball.—Minnesota routed Arizona, 12-1, at Omaha, Neb., to take the National Collegiate Athletic association title. The victors compiled a record of 5 decisions and 1 setback in the double elimination series, Arizona having a 4 and 2 mark. Yale won the Big Three and Eastern (Ivy) crowns.

Other major college champions of 1956 included the following:

Southeast—Florida
Southern—George Washington
Atlantic Coast—Duke
Western (Big Ten)—Minnesota
Interstate—Illinois Normal
Mid-American—Ohio University
Missouri Valley—Bradley
Illinois—Illinois Wesleyan
Yankee—New Hampshire

Central I.A.C.—Maryland State
Midwest—St. Olaf
Mountain States—Wyoming
Border—Arizona
Pacific Coast—Washington State
Big Seven—Oklahoma
Southwest—Texas Christian
Mason-Dixon—Hampden-Sydney
California I.B.A.—So. California

Basketball. The University of San Francisco Dons won the National Collegiate Athletic association championship play-offs in the 1955-56 season by defeating the University of Iowa, Western conference title winner, 83-71, at McGaw Memorial hall, Evanston, Ill. The triumph capped an unbeaten campaign for the Dons and marked their 55th straight victory,

surpassing the former intercollegiate record of 39 straight decisions shared by Seton Hall university and Long Island university. San Francisco, led by its 6 ft. 10 in. centre Bill Russell who made 26 points in the game, overcame an early 15-4 Iowa lead to go ahead 38-33 at the half and was never overtaken. In the consolation contest, Temple downed Southern Methodist, 90-81, as Hal Lear of the victors scored 48 points, a N.C.A.A. championship game record. The 29 games of the tournament drew a record total of 132,513 spectators.

Russell proved the most popular selection ever in United Press polling for the All-America team. Rounding out the first quintet were Robin Freeman, Ohio State; Si Green, Duquesne; Darrel Floyd, Furman and Tom Heinsohn, Holy Cross.

The National Association of Intercollegiate Athletics (N.A.I.A.) tourney for small colleges at Kansas City, Mo., was won by McNeese State college of Lake Charles, La., with a 60-55 victory over Texas Southern of Houston, Tex. In the consolation game for third place, Pittsburg (Kan.) State halted Wheaton (Ill.) college, 77-70. North Carolina State, after tying North Carolina for first place in regular-season play in the Atlantic

BILL RUSSELL sinking a basket in the semifinal game of the National Collegiate Athletic association tournament at Chicago, Ill., March 22, 1956. Russell's team, the University of San Francisco Dons, beat Southern Methodist university 86-68

Coast conference, captured the title for the third successive season by beating Wake Forest (N.C.), 76-64, in the last round of the conference tourney. The annual national invitation tournament at New York's Madison Square Garden was captured by the University of Louisville. The Kentuckians, paced by Charlie Cyra's 27 points, defeated Dayton (Ohio) 93-80 in the final. St. Joseph's of Philadelphia, Pa., topped St. Francis of Brooklyn, 83-82, in the third-place contest.

Other major tournament champions included San Francisco (New York holiday festival); Tulsa (all-college at Oklahoma City); Iowa State (Big Seven at Kansas City); North Carolina State (Dixie classic at Raleigh, N.C.); Clemson (Gator Bowl at Jacksonville, Fla.); Brigham Young (Motor City classic at Detroit, Mich.); West Virginia (Orange Bowl at Miami Beach, Fla.); Cincinnati (Richmond, Va., invitation); Southern Methodist (Southwest conference at Houston, Tex.); Notre Dame (Sugar Bowl at New Orleans); George Washington (Winter invitation at College Park, Md.). The West's All-Stars routed the East, 103-72, in the 10th New York Herald-Tribune Fresh Air Fund game at Madison Square Garden before a crowd of 17,852. The West also won the 5th annual Shrine benefit contest at Kansas City, 74-62.

Among the major college league champions of 1956 were the following:

Eastern (Ivy)—Dartmouth (Hanover, N.H.)
Southeastern—Alabama (University, Ala.)
Southern—West Virginia (Morgantown, W.Va.)
Atlantic Coast—North Carolina State (Raleigh, N.C.)
Western (Big Ten)—Iowa (Iowa City, Ia.)
Big Seven—Kansas State (Manhattan, Kan.)
Missouri Valley—Houston (Houston, Tex.)
Mid-American—Marshall (Huntington, W.Va.)
Midwest—Coe (Cedar Rapids, Ia.)
Interstate—Western Illinois State (Macomb, Ill.)
Mountain States (Skyline)—Utah (Salt Lake City, U.)
Border—Texas Tech. (Lubbock, Tex.)
Pacific Coast—U.C.L.A. (Los Angeles, Calif.)
Southwest—Southern Methodist (Dallas, Tex.)
Rocky Mountain—Idaho State (Pocatello, Ida.)
Ohio Valley—Morehead State (Morehead, Ky.)
Yankee—Connecticut U. (Storrs, Conn.)
Central I.A.A.—Maryland State (Princess Anne, Md.)

Professional Basketball.—The Philadelphia Warriors annexed the National association championship by conquering the Ft. Wayne (Ind.) Pistons in the final series. Play-off results follow:

Eastern semifinals
Boston 110, Syracuse 93
Syracuse 101, Boston 98
Boston 102, Boston 97

Western semifinals

St. Louis 116, Minneapolis 115
Minneapolis 133, St. Louis 75
St. Louis 116, Minneapolis 115

Eastern finals

Philadelphia 109, Syracuse 87
Syracuse 122, Philadelphia 118
Philadelphia 119, Syracuse 96
Syracuse 108, Philadelphia 104
Philadelphia 109, Syracuse 104

Western finals

St. Louis 86, Ft. Wayne 85
St. Louis 84, Ft. Wayne 74
Ft. Wayne 107, St. Louis 84
Ft. Wayne 93, St. Louis 84
Ft. Wayne 102, St. Louis 97

All-championship finals

Philadelphia 98, Ft. Wayne 94
Ft. Wayne 84, Philadelphia 83
Philadelphia 100, Ft. Wayne 96

Bob Pettit of the St. Louis Hawks, the league's top scorer, Paul Arizin and Neil Johnston of the Warriors and the Boston Celtics' Bob Cousy and Bill Sharman were chosen for the 1956 All-league first five. In the East-West All-Star contest on Jan. 24 at Rochester, N.Y., the West won by 108-94.

Amateur Athletic Union Basketball.—The 1956 title tournament, at Denver, Colo., March 19-24, drew a field of 26 A.U. teams. Seattle's Buchan Bakers won the title, the result of a 59-57 last-second victory over the defending champion Phillips 66 Oilers of Bartlesville, Okla., in the final. The Bakers reached the final round by eliminating the Allen-Bradley five of Milwaukee, 85-75, while Phillips advanced by topping the Adair Oilers of Mobile, Ala., 71-69. The Phillips five, which earlier in the campaign retained its National Industrial League honours, also placed first in the final Olympic trials at Kansas City, April 24. After losing to the Armed Forces All-Stars, 78-77, the Phillips men came back to beat the Buchan Bakers, 72-64, and

SOVIET GIANT, Vasily Akhtayev, 7 ft. 6½ in. tall, towering over his teammates and opponents during a 1956 basketball game in Moscow

the College All-Stars, 79-75. The Phillips team placed Chuck Darling, Burdette Haldorson, Bob Jeangerard, Bill Hougland and Jim Walsh, with Joe Dean among the alternates, on the U.S. Olympic squad that also included Bill Russell and K. C. Jones of San Francisco U.

The Wayland Flying Queens of Plainview, Tex., annexed the women's national A.A.U. title for the third successive year, beating the Nashville (Tenn.) Business College club, 39-33, in the final at St. Joseph, Mo., March 15. Elizabeth, N.J. won national Y.M.C.A. honours.

Behavioral Sciences. By 1956 the term "behavioral sciences" had gained wide usage in the United States and was beginning to be employed by English and European scientists. Rarely used before World War II, by 1951 when the Ford foundation began its large philanthropic work the term was chosen to name one of the five major fields of the foundation's activity—the Behavioral Sciences program. In July 1952 it appropriated funds to establish the Center for Advanced Study in the Behavioral Sciences, which began operations in Sept. 1954. In 1953 a book was published on research methods in the behavioral sciences, while in Jan. 1956 a new scientific journal called *Behavioral Science* was founded by the Mental Health Research institute of the University of Michigan, Ann Arbor.

This rapid acceptance of a new term reflects two characteristics of the contemporary scientific study of man: its increasing focus upon human behavior, and the multiplicity of scientific fields concerned. Philosophy and the arts have always centred their attention upon man, but science with its emphasis upon

objectivity and public verification of its generalizations began with the study of nonliving things, then applied its methods of observation and thought to plants and animals. When man became a subject of scientific study, the focus was upon his anatomy and physiology. In the past half-century, however, man's behavior, that is, his ways of thinking, feeling and acting, has become a major subject of investigation by a variety of sciences, such as anthropology, ecology, economics, geography, history, linguistics, neurology, pharmacology, physiology, political science, psychiatry, psychology and sociology. But since each of these fields has evolved its own methods and concepts and its own specific focus of attention, little synthesis of the knowledge about human behavior has resulted. World War II witnessed an acute demand for comprehensive knowledge of man, and efforts at collaboration among several scientists were begun. By 1956, many behavioral scientists in different fields were actively sharing common methods of investigation, concepts for analyzing and summarizing data and generalizations.

Earlier studies were largely descriptive, reporting and summarizing observations of human activity. Recently more effort has been devoted to explanation—the conditions affecting behavior and possible causes—the “how” and “why” of man's reactions. Interest is also developing in the use of mathematics and systematic logic in seeking more precise formulations of relations among factors involved in human behavior, particularly in cause-and-effect relations. Mathematicians, logicians and statisticians are collaborating with behavioral scientists in constructing models to guide investigation and analysis. There is also a growing collaboration between scholars who lean heavily upon personal experience and perspective in interpreting human action, thought and feeling (creative writers, some philosophers and some historians) and scientists who rely more largely for interpretation on explicitly defined methods of analysis and synthesis (psychologists and sociologists, for example). The name “behavioral sciences” symbolizes the current evolution in the study of man.

Unlike the earlier “behaviorism,” the term “behavioral sciences” has not become the name of a special system but is the designation of a broad area of scientific inquiry. (R. W. Tr.)

ENCYCLOPÆDIA BRITANNICA FILMS.—*Emergence of Personality* (series of 5 films) (1948); *Mental Health* (Keeping Mentally Fit) (1952); *Personality and Emotions* (1955); *Why Vandalism?* (1955); *Your Children's Sleep* (1950); *Yale Clinic Child Development* (series of 11 films) (1934).

Belgian Colonial Empire. The Belgian colonial empire consists of the colony of the Congo in central Africa and the adjacent trust territories of Ruanda and Urundi administered with the Congo. Total area: 925,733 sq.mi. Total pop. (1954 est.) 16,674,860. Areas, populations, capital towns, status and governors of the separate territories are given in the table.

Belgian Colonial Empire					
Country	Area (In sq.mi.)	Population (1954 est.)	Capital	Status	Governor
Belgian Congo	904,991	Africans 12,317,300 Europeans 86,688 (incl. 67,827 Belgians)	Léopoldville	Colony	Léo Pétillon, governor general
Ruanda- Urundi	20,742	Africans 4,261,900 Europeans 5,559 (incl. 4,110 Belgians) Others 3,413	Usumbura*	{Sultanates, trust terri- tories}	Claeys-Bouvaert, governor

*Principal town of Ruanda, Kigali; principal town of Urundi, Kitega.

History.—The Belgian administration in the colony of the Congo and in the trust territories of Ruanda and Urundi continued in 1956 the policy of promoting social security and of training the native people toward self-government. Two decrees were drafted concerning organized labour in the Congo. Trade unions would have to obtain recognition by the Belgian authorities and would be established as corporate bodies. The right to join a trade union, and the eventual existence of several union

MODERN ARCHITECTURE in the Belgian Congo, a 1956 home at Manono designed to give maximum protection from the sun, wind and rain

movements, as was the case in Belgium, were admitted. In the public services, however, strikes remained forbidden. In private enterprises they were permitted when all existing means for compromising had failed.

In Ruanda and Urundi the native male population for the first time went to the polls in October for the election of local councilors. Out of 900,000 registered electors, more than 700,000 took part in the vote. White colonists were not allowed to vote but some of them were elected, which indicated the spirit of co-operation between Europeans and Africans.

The new hydroelectric power station on the upper Lualaba river, near Zilu, was inaugurated in August. It was the biggest in central Africa. In August the railway section between the military base at Kamina, in the Katanga province, and Kabalo was opened. The new railway was the shortest connection between the Katanga mining region and Dar es Salaam, Tanganyika, where in October new port installations were inaugurated by Princess Margaret. By virtue of the 1921 Anglo-Belgian agreement, the Belgian Congo enjoyed freedom of transit between the Belgian base and Dar es Salaam.

(M. H. St.)

Finance.—Monetary unit: Congolese franc, nominally an independent currency, actually at par with the Belgian franc. Budgets (1956 est.): *Congo*: revenue (ordinary) 10,224,793,000 fr., (extraordinary) 411,176,000 fr.; expenditure (ordinary) 10,221,326,000 fr., (extraordinary) 8,695,824,000 fr. *Ruanda-Urundi*: revenue (ordinary) 647,108,000 fr., (extraordinary) 408,330,000 fr.; expenditure (ordinary) 746,262,000 fr. (extraordinary) 746,046,000 fr.

Foreign Trade.—(1955) Imports 18,951,000,000 fr.; exports 22,703,000,000 fr.; gold exports (1954) 634,000,000 fr.

Transport and Communications.—Roads (1952) 128,253 km. Motor vehicles in use (*Congo*, 1954): passenger 24,015, commercial (including buses) 23,174. Railways (1953) 4,762 km. Waterways (1953) 18,961 km. Telephones (Jan. 1955) 13,604.

Agriculture.—Production: *Congo* (metric tons, 1955; 1954 in parentheses): palm oil 235,000 (225,000); palm kernel oil 60,000 (54,700); cottonseed 100,000 (96,000); rubber (exports) 26,040 (22,560); lint cotton, 50,000 (48,000); coffee (including *Ruanda-Urundi*) 41,100 (37,300); peanuts 188,000 (180,000); sweet potatoes and yams (1954) 343,000 (309,000 in 1953); cassava (1954) 6,785,000 (6,751,000 in 1953); timber products (cu.m., 1954) logs 755,887, sawn wood 254,141, pitwood 2,069,991. *Ruanda-Urundi* (metric tons, 1954; 1953 in parentheses): cassava 2,040,000 (1,805,000); sweet potatoes and yams 1,964,000 (1,442,000); dry beans 264,000 (334,000).

Industry.—Production (metric tons, 1955): coal 479,925; copper, smelter (*Congo*, exports) 230,880; zinc, smelter (*Congo*, exports) 33,240; tin concentrates, metal content, 15,480; tin, smelter (*Congo*) 2,880; cobalt ore 8,227; manganese ore 461,732; tungsten ore 311; gold 11,359 kg.; diamonds 12,413,199 carats.

ENCYCLOPÆDIA BRITANNICA FILMS.—*A Giant People* (the Watuusi) (1939); *People of the Congo* (the Mangbetu) (1939); *Pygmies of Africa* (1939).

Belgian Congo: see BELGIAN COLONIAL EMPIRE.

Belgium. A kingdom of western Europe, Belgium is bounded southwest by France, north by the Netherlands and east by Germany and Luxembourg. Area: 11,779 sq.mi. Pop.: (1947 census) 8,512,195; (1955 est.) 8,868,000. Language (1954 est.): Flemish (Dutch) 50%; French 34%; Flemish and French 15%; German 1%. Religion: mainly Roman Catholic. Chief towns (pop., 1952 est.) Brussels (cap.) 180,771; Antwerp 261,-

405; Liège 156,728; Ghent 164,713; Bruges 51,924. Ruler, King Baudouin I; prime minister in 1956, Achille van Acker.

History.—In Feb. 1956 King Baudouin attended at Ghent a ceremony commemorating the 25th anniversary of the Flemish university and was given an honorary doctorate.

A national tribute was paid to Queen Elisabeth, grandmother of the king, on her 80th birthday. In all cities and villages money was collected for a Queen Elisabeth foundation to promote the philanthropic and cultural institutions in which she was interested.

On Sept. 24, on the occasion of Chancellor Konrad Adenauer's visit to Brussels, a series of agreements was signed by Heinrich von Brentano, foreign minister of the German Federal Republic, and Paul Henri Spaak, the Belgian foreign minister. The main agreement concerned frontier adjustments. Some enclaves had been transferred to Belgium in 1949 after a decision of the Council of Foreign Ministers and it was now decided that Belgium would return to Germany the villages of Bildchen, Leykoul, Losheim and Hemmeres together with the forests of Freyen and Bullingen, whereas Germany would assign the forests of Wahlen-scheid and Losheimergraben to Belgium. The adjustments were intended to facilitate traffic arrangements and local administration and no transfer of population was involved. Both Adenauer and Spaak expressed satisfaction at the result of the negotiations and said that the adjustments were final.

Delegates of the Supreme Soviet visited Belgium in May and in October Van Acker and Spaak paid an official visit to Moscow where on Oct. 25 a cultural agreement was signed providing for the exchange of professors, teachers, students, members of cultural institutions and scientists.

On Nov. 8, because of the Soviet armed intervention in Hungary, the government informed Moscow that the agreement would not enter into operation.

At the end of January Paul van Zeeland, a Christian Social senator and former prime minister, decided to leave politics and joined a banking group. In February Oscar Bossaert, a Liberal member of the senate and the first minister of the middle classes, died from a heart attack. He was succeeded as a minister by Léo Mundeeler, a Liberal member of the chamber of deputies.

During the whole year the problem of "Euratom," the Atomic Energy authority for the six member countries of the European Coal and Steel community, and of a European common market were discussed by experts in Brussels under the chairmanship of Spaak. At the end of the year negotiations were proceeding for the drafting of appropriate treaties. The main difficulties came from the French concern about possible trouble during the transition period from the French protectionist system to an open market.

Great importance was attached to the improvement of the Antwerp port installations and the widening of rivers and inland canals.

Economic activity was overshadowed by the mine disaster which occurred on Aug. 8 when in a pit of the Bois-du-Cazier colliery at Marcinelle, in the Hainault province, a derailed coal truck fell in a ventilating shaft, cutting an electric cable and causing a short circuit resulting in a fire which was extinguished only after 11 days. There were 262 victims among the miners.

Foreign trade and economic activity expanded throughout the year. The index of industrial production in September was 164.9 (1936-38=100) and 116.4 (1954=100). There was a shortage of skilled labour and the government had to take measures to counter inflation.

The government fixed the total strength of the armed forces for 1957 at 145,300 men: 115,100 in the army, 25,400 in the air force and 4,800 in the navy. In addition 38,746 men would

be available for the territorial anti-aircraft guard. Defense expenditure in 1957 would amount to 11,448,604,000 Belgian francs (\$228,972,080) as against 13,001,204,000 francs (\$260,024,080) in 1956. (See also EUROPEAN UNITY.) (M. H. St.)

Education.—Schools (1953-54); primary 8,745, pupils 826,328, teachers (1953) 37,574; secondary 783, pupils 199,229, teachers (state only) 9,879; vocational 2,437, pupils 247,740; teachers' training colleges (excluding post-secondary) 169, students 18,669. Institutions of higher education 23 (including 4 universities), students (1953-54) 22,647.

Finance and Banking.—Monetary unit: Belgian franc, with an average exchange rate of 49.88 to the U.S. dollar in March 1956. Budget (1955; 1956 est. in parentheses): revenue 81,730,000,000 fr. (85,325,000,000 fr.); expenditure 98,989,000,000 fr. (95,363,000,000 fr.). Total public debt (Dec. 1955) 332,873,000,000 fr.; external debt (1956) 22,305,000,000 fr. Gold and foreign exchange holdings (central bank, U.S. dollars, April 1955; March 1956 in parentheses) 1,046,000,000 (1,192,000,000). Currency circulation (Sept. 1955; Sept. 1954 in parentheses) 110,000,000,000 fr. (105,200,000,000 fr.). Deposit money (Sept. 1955; Sept. 1954 in parentheses) 80,600,000,000 fr. (73,600,000,000 fr.).

Foreign Trade.—(Belgium-Luxembourg economic union, 1955): imports 141,200,000,000 fr.; exports 138,200,000,000 fr. Main sources of imports: Germany 14%; Netherlands 13%; France 12%; other continental E.P.U. (European Payments' Union countries) 32%; E.P.U. dependencies 9%; sterling area 18%; U.S. and Canada 13%. Main destination of exports: Netherlands 21%; Germany 18%; other continental E.P.U. 18%; sterling area 13%; U.S. and Canada 12%.

Transport and Communications.—Roads (1953) 62,700 km. Motor vehicles in use (1954): passenger 418,000, commercial 178,000. Railways (S.N.C.B. and S.N.C.V., 1954) 7,923 km.; passenger-km. (S.N.C.B. only, 1954) 7,562,000,000; freight, ton-km. (S.N.C.B. only, 1955) 6,564,000,000. Shipping: merchant vessels of 100 gross tons and over (July 1955) 193; total tonnage 497,536. Navigable inland waterways (1955) 1,568 km. Air transport (1955): passenger-km. 578,772,000; cargo, ton-km. 26,232,000. Telephones (Jan. 1955) 830,405. Radio receiving sets (1954) 1,986,000.

Agriculture and Fisheries.—Production (metric tons, 1955; 1954 in parentheses): wheat 757,000 (589,000); barley 280,000 (247,000); oats 425,000 (452,000); rye 220,000 (245,000); potatoes 2,184,000 (2,634,000); flax fibre 44,900 (38,900); beet sugar (raw) 368,000; meat 368,400. Fish landings (1955) 69,504 metric tons.

Industry.—Fuel and power (1955): coal 29,712,000 metric tons; manufactured gas 2,076,000,000 cu.m.; electricity 11,196,000,000 kw.hr. Production (metric tons, 1955): pig iron 5,388,000; crude steel 5,904,000; copper, refined 156,960; lead, refined 82,800; zinc, smelter 213,120; tin, smelter 10,560; aluminum 2,412; cement 4,692,000; cotton yarn 107,520; cotton fabrics 74,100; wool yarn 41,640; woollen fabrics 28,452; rayon filament yarn 10,920; rayon staple fibre 21,000.

Benson, Ezra Taft (1899-), U.S. government official, was born on Aug. 4 in Whitney, Ida. He attended Utah State Agricultural college, Logan (1918-21); Brigham Young university, Provo, Utah; and Iowa State college, Ames. After spending several years farming in southern Idaho, he was employed as an agricultural agent by the University of Idaho extension service until 1930, when he was placed in charge of economics and marketing work for the state of Idaho. He held this position until 1937. He was executive secretary of the National Council on Farmer Cooperatives (1939-44) and was president of the Washington Stake, Church of Jesus Christ of Latter Day Saints, in Washington, D.C. (1940-44).

Benson was opposed to federal food subsidies and believed that they were a cause rather than a preventive of inflation; this view of federal aid for farmers gained him a number of political opponents in agricultural circles. Designated as secretary of agriculture by Pres. Dwight D. Eisenhower on Nov. 24, 1952, he took office on Jan. 21, 1953.

Benson's tenure in office was marked by his opposition to fixed 90% parity props for agricultural products and his advocacy of flexible supports ranging from 75% to 90% of parity. This policy earned him the enmity of large and influential agricultural groups, but he refused to modify his stand and was singled out by the Democrats as a special political target in 1955-56 on the issue of declining farm income. At his urging President Eisenhower on April 15, 1956, vetoed a farm bill containing fixed 90% supports, but signed a compromise bill May 28 which contained soil-bank provisions recommended by Benson. Prior to the na-

tional election of Nov. 1956 Benson made an extensive campaign tour to defend his farm program.

Benton, William (1900—), U.S. publisher and public official, was born on April 1 in Minneapolis, Minn. He was graduated from Yale university in 1921. In 1929, in partnership with Chester Bowles, he founded the advertising agency of Benton and Bowles.

Benton retired from the agency in 1936 and in 1937 became vice-president of The University of Chicago, where he served on a part-time basis until 1945. In 1942, in collaboration with Paul G. Hoffman, he helped to found the Committee for Economic Development, and he was active in inter-American affairs. At his instance The University of Chicago acquired Encyclopædia Britannica, Inc., in 1943. He financed the company, became publisher and chairman of its board and shared its ownership with the university. He launched the company into the classroom motion-picture field and served as chairman of Encyclopædia Britannica Films Inc.

Benton was appointed U.S. assistant secretary of state by Pres. Harry S. Truman on Aug. 31, 1945, and served until Sept. 30, 1947. He developed the country's first peacetime program of international information and educational exchange and took responsibility for U.S. participation in the United Nations Educational, Scientific and Cultural organization.

In Dec. 1949 Benton was appointed U.S. senator from Connecticut. In the election of Nov. 7, 1950, he was returned to the senate for two more years, but two years later he was defeated in his bid for a full six-year term. His three years in the senate were marked by his campaign in behalf of a "Marshall plan of ideas"; his vigorous espousal of the Hoover commission's recommendations on government reorganization; his resolution calling for expulsion of Sen. Joseph McCarthy of Wisconsin; and by adoption of the "Benton amendment" to the Mutual Security act.

In 1955 Benton, his wife and their son John travelled in the Soviet Union and some of the eastern European countries to study the impact of communist propaganda on the Russian and satellite peoples. His reports during 1956 on gains in Soviet education dramatized the "cold war of the classroom" as a factor in "competitive co-existence." Benton proposed establishment by the U.S. government of 100,000 college scholarships a year "to check the vast and tragic leakage of talent from our educational system."

Bequests, Philanthropic: see DONATIONS AND BEQUESTS.

Berlin. Capital of the German reich from 1871 to 1945, Berlin was still by 1956 the largest city of Germany. Area: 341 sq.mi. Pop.: (1939 census) 4,321,500; (1955 est.) 3,300,000. From June 6, 1945, Berlin was administered by an inter-Allied government authority consisting of the commandants of the four sectors of Berlin. After June 24, 1948, when the Soviet commandant proclaimed the dissolution of the authority, Berlin was in fact divided into two opposing administrations. By Dec. 31, 1956, the three western sectors (area, 186 sq.mi.; pop., 1950 census, 2,146,952; 1955 est., 2,100,000) were under the authority of the three following Allied commandants: Great Britain, Maj. Gen. R. C. Cottrell-Hill; United States, Maj. Gen. Charles L. Dasher; France, Brig. Gen. A. J. B. Gèze. In the Soviet sector (area, 155 sq.mi.; pop., 1946 census, 1,175,979; 1955 est., 1,200,000) Maj. Gen. P. A. Dibrova was military commander. There were also two rival German city governments and two lord mayors. Otto Suhr was *Oberbürgermeister* of western Berlin, appointed by an elected city assembly; Friedrich Ebert was *Oberbürgermeister* of the Soviet sector, appointed by the

Sozialistische Einheitspartei Deutschlands.

History.—The year 1956 was the most uneventful which the city of Berlin had experienced since World War II. Throughout the year western Berlin was a city of normality. Its traditional "occasions"—the Labour day rallies on May 1, the Day of National Unity on July 17 and the Trade fair celebrations—passed without serious incident. While steady progress was being made on the four-year plan for the reconstruction of the city and unemployment was dropping below 100,000 (August) for the first time since 1946, Berlin's communications with the German Federal Republic functioned normally. German motorists continued to pay the *Autobahn* dues, which were imposed on April 1, 1955 and revised on June 4, 1955, for the use of the road from Helmstedt to Berlin.

Probably the most important event which took place in Berlin was the Evangelical Church congress at the end of June. The Extraordinary Synod of the Evangelical Churches met alternately in eastern and western Berlin and discussed church policy for the whole of Germany. The synod decided to oppose conscription in western Germany and the creation of the 90,000-strong eastern German army. Members bitterly criticized the repression of religion in the German Democratic Republic, and the synod decided not to make the declaration of loyalty desired by the eastern German government. Finally, the synod asked for every possible step to be taken to secure German reunification.

Twice the eastern German government organized armed marches through the streets of eastern Berlin which were contrary to the city's four-power charter. The first occasion was on Jan. 15, and the western powers lodged a formal protest with the Soviet ambassador to the German Democratic Republic, G. M. Pushkin, on Feb. 10. The second occasion was on May 1, and the western powers protested on May 17. Persons taking part in these armed marches included members of the new eastern German armed forces, of the "factory guards" and uniformed people's police. In November more than 100,000 western Berliners

WIRE-TAPPING APPARATUS uncovered by Soviet authorities in east Berlin in 1956. It was claimed that about 300 telephones were affected; some of the underground equipment was marked "Made in U.S.A." and "Made in England"

demonstrated in front of the Brandenburg gate as a protest against Soviet armed aggression in Hungary.

On Oct. 1 former Adm. Karl Dönitz was released from the four-power prison of Spandau. This left only four of the "major" war criminals in Spandau. Of them, Rudolf Hess and Walter Funk were serving life sentences, and Albert Speer and Baldur von Schirach were serving sentences of 20 years' imprisonment. Dönitz refused to make any statement to the press after his release. He said, "I intend to remain silent now, and in the future."

On Feb. 6 the former Communist youth leader Robert Bialek, who fled to western Berlin in July 1953, was kidnapped and taken to eastern Germany. Bialek had been working for the western Berlin radio network. No effective protest was made, and nothing was known of his whereabouts. This was one of a number of kidnappings during 1956.

(See GERMANY.)

(T. PE.)

ENCYCLOPÆDIA BRITANNICA FILMS.—*Germany* (1955).

Bermuda. This British colony consists of 360 small islands (20 inhabited) 580 mi. east-south-east of Cape Hatteras, N.C. Area: 21 sq.mi., including 2.83 sq.mi. leased to the United States for naval and military bases. Pop.: (1950 census) 37,403, including 22,638 coloured and 14,724 Europeans; (1955 est.) 40,455. Language: English. Religion: Christian (about 55% Anglican). Chief towns (pop., 1955 est.): Hamilton (cap.), 3,000; St. George's, 1,550. Governor in 1956, Lieut. Gen. Sir John Woodall.

History.—Government revenue for 1956 was estimated at £2,866,257 and expenditure at £2,865,169. Tourism was again the principal industry; the number of tourists (110,651) visiting the colony in 1955 was a record, more than 104,000 being from the United States. The Bermuda Crown Lands corporation began the development of the former naval dockyard area at West End as an industrial area in conjunction with a free port; the corporation planned to spend £125,000 on rehabilitating buildings and £45,000 on refitting part of the dockyard for boat building. A Bill passed in July 1956 gave exempted companies and their shareholders tax immunity for up to 30 yr. As a result of this and of the free port facilities, an increasing number of British and other shipping companies registered subsidiaries in Bermuda.

(R. H. Y.)

Education.—Schools (1955): government maintained and aided, primary 9, pupils 7,461, teachers 288; secondary 9, pupils 788, teachers 68; technical and vocational 6, pupils 196, teachers 13; independent, primary 13, pupils 1,000, teachers 28; secondary 4, pupils 209, teachers 14; technical and vocational 1, pupils 16, teachers 1.

Finance and Trade.—Monetary unit: Bermuda pound, at par with sterling. Budget (1955 actual; 1956 est. in parentheses): revenue £2,895,302 (£2,866,257), expenditure £3,082,295 (£2,865,169). Foreign trade (1955): exports £13,400,000, imports £3,410,000. Main exports: cut flowers (lilies) and concentrates and essences.

Eryllium: see MINERAL AND METAL PRODUCTION AND PRICES.

Best Sellers: see BOOK PUBLISHING AND BOOK SALES.

Betting and Gambling. The amount of money risked on betting and gambling in the United States increased in 1956 over 1955, but this was attributable chiefly to opportunities that did not exist in 1955: the presidential election, and general use by newspapers of prize contests to increase circulation. Otherwise there was little or no increase except in betting on horse races.

Betting on the presidential election was unusually light. One bookmaking syndicate estimated the national total at about \$50,000,000, less than one third what might be expected in a close election. Backers of Adlai E. Stevenson demanded higher odds than the 6 or 7 to 1, or usually less, that were offered. Backers of Dwight D. Eisenhower were deterred by memory of the 1948 election, when the odds on Thomas E. Dewey went to 20 to 1 and losses on him were heavy.

The newspapers' circulation-building contests might be considered gambling only in a technical sense. The U.S. "lottery laws" (18 U.S. Code 1302) deny the use of the mails to a prize contest when the contestant must pay money or any other consideration to enter and when the result depends on chance "in whole or in part." Some newspapers offer prizes dependent wholly on chance, such as having a particular telephone number; others use games such as crossword puzzles purporting to be contests of skill. The latter have been ruled by the post office department to be sufficiently dependent on chance to violate the lottery laws, but through 1956 the post office had not refused the use of the mails to such contests. It was estimated that about 800 (or 50%) of the daily newspapers in the United States used contests of one kind or another during 1956. Estimates of the total amount spent by contestants to enter the contests varied greatly, from \$100,000,000 to \$300,000,000.

Legal betting through pari-mutuel machines at U.S. race tracks was about \$2,231,500,000 in 1956. Of this more than \$525,000,000 was on harness races, an increase of 5% over 1955; the remainder, bet on running races, represented an increase of only about 2%. The increase was attributed chiefly to increased attendance at race tracks, which reached 30,000,000 for the first time.

The play at the licensed gambling houses of Nevada decreased slightly. In New Jersey, which permits lotteries and bingo games as fund-raising mediums for charities and the like, there was an estimated increase of 25% over the 1955 figure of \$17,000,000 in funds realized for the beneficiaries. Total gambling in the state still declined, because of a ruling of the New Jersey supreme court that the games similar to bingo that for years had been played at shore resorts such as Atlantic City were a violation of the state's various antigambling statutes.

The U.S. internal revenue service estimated that the amount collected, at \$50 each, in annual taxes on professional gamblers would decrease at least 50% from the 1955 total of about \$9,500,000; but this was attributed more to general evasion of the tax than to a decrease in the number of persons liable.

(A. H. MD.)

Great Britain.—No marked change occurred in 1956 in expenditure on gambling in Great Britain as compared with 1955. The amount staked on football pools was estimated at £70,000,000, and on dog-track totalizators at £59,000,000. There was a small upward movement in the totalizator betting on horse races, and an increase to about £11,000,000 in the stakes placed in Irish Hospitals sweepstakes.

The Small Lotteries and Gaming act, 1956, received the royal assent in July. It originated as a private member's bill introduced by Ernest Davies in Nov. 1955. This act permitted the promotion of lotteries in which tickets might be sold to the public by societies which were established and conducted for charitable, sporting or cultural purposes, or for other purposes which were not purposes of private gain or of any commercial undertaking. Societies must register with the local authority, and must make to it returns giving particulars of lotteries which they promote. The conditions imposed on the conduct of a lottery promoted under the act included ones that the total value of tickets sold must not exceed £750, and that the amounts appropriated from the proceeds for expenses and prizes must not exceed 10% and 50% respectively.

The act also made lawful, subject to conditions, certain kinds of gaming parties conducted with the object of raising money for purposes other than private gain—the whist drive for charity (which for many years had not in practice been subject to prosecution) was a common example.

In his budget speech on April 17, the chancellor of the exchequer, Harold Macmillan, announced a plan for the sale of a new government security known as the "premium bond." No

interest would be paid on bonds, but holders would qualify for participation in a distribution according to chance of tax-free prizes from a prize fund amounting to 4% per annum of the amount invested. This scheme was strongly criticized by church leaders and other persons opposed to gambling. (See also HORSE RACING.) (H. W. Sv.)

Bhutan. An Indian-protected princely state in the Himalayas, Bhutan lies between India (Assam, south and east, and West Bengal, southwest), Tibet (north and northwest) and Sikkim (west). Area: about 19,305 sq.mi. Pop. (1955 est.): 623,000, mainly Bhutane, Bhotias or Duk-pa of Tibetan origin (*Bhot*=Tibet); also many Nepalese in the south. Language: a Tibetan dialect.

Religion: Duk-pa Buddhism, a crude unreformed Lamaism. Capitals: Punaka (winter) and Tashi-Cho-dzong (summer). Maharaja, Jigme Dorji Wangchuk.

History.—In May 1956 a delegation from Bhutan attended King Mahendra's coronation at Kathmandu, Nepal. It was headed by Jigme Dorji, 37-year-old brother-in-law of the Bhutanese ruler and his closest adviser. "We have begun to sow a few seeds of democracy," said Jigme Dorji to foreign correspondents. The maharaja of Bhutan set up a central advisory council composed of elders elected by the villages. It was also decided to build up an educational system and later invite foreign assistance in the administration of the country's economy. The 1956 budget amounted to about Rs. 3,000,000, including the Indian subsidy of Rs. 500,000 a year.

Economy.—Annual subsidy from India, Rs. 500,000; annual trade with India, about Rs. 776,000. Chief products: rice, Indian corn, millet, timber. Livestock: elephants, ponies. Chief manufactures: fine swords, muzzle-loading muskets, fly whisks (chowries), lac, wax, cloth, musk.

Bicycling: see CYCLING.

Billiards. Willie Mosconi of Philadelphia, Pa., regained the world pocket-billiards championship he had lost to Irving Crane of Rochester, N.Y. in April 1955, and then went on to dominate competition in 1956. In a week-long match at Allingers' in Philadelphia, Nov. 26–Dec. 2, 1955, Mosconi triumphed over Crane, 1,500–676. He then turned back Jimmy Caras of Upper Darby, Pa., in what was billed as a world championship challenge match of 10 blocks played in six cities. Mosconi established a new record in the sixth block of the match at Chicago, Ill., Feb. 16, 1956, when he defeated Caras, 150 to minus 1, running 151 balls in the second inning to break his own previous record of 150 for championship play. The two-inning triumph also tied a mark held jointly by Mosconi and George Chenier of Canada.

In the world pocket-billiards championship tournament held in April 1956 at Kingston, N.C., Mosconi again demonstrated his prowess and became the first man in the history of the competition to triumph in all 14 of his matches. The undefeated titleholder climaxed his performance by shutting out Jimmy Moore of Albuquerque, N.M. Mosconi ran 150 balls from the break to win, 150–0, in one inning and set up another tourney record.

Arthur Rubin won the metropolitan New York three-cushion championship by defeating Abe Rosen, 150–148. Michigan State university carried off national intercollegiate team laurels in 1956 for the second straight year.

(T. V. H.)

Biochemistry. **Animal Hormones.**—Tremendous advances were made in the hormone field during 1956, particularly among the steroid hormones. Cortisone, which had been isolated and synthesized a few years before and extensively used in arthritis therapy and other diseases, was found to have severe limitations because of the nonspecificity of its physiologi-

cal action and its side effects. Hydrocortisone and halogen derivatives of both hydrocortisone and cortisone were found to be more potent in their action than cortisone. After these derivatives had established a firm foothold in the hormone field, prednisolone and prednisone (from hydrocortisone and cortisone, respectively) were synthesized. These compounds differed chemically from their predecessors in that they possessed an additional double bond in the A ring of the steroid nucleus. Activity of these steroids was more potent, and less serious side reactions due to salt effects occurred after prolonged use. Water retention, a major metabolic side effect among most previous steroid compounds, was not pronounced with these two compounds.

Great research effort was spent in the direction of diminishing some hormonal influences of steroids while maintaining or increasing other properties. A steroid (21-hydroxypregnan-3, 20-dione sodium succinate) was prepared which had no hormonal activity but was a potent anesthetic. Another steroid, 17 α ethyl-19 nortestosterone, structurally related to testosterone (the male sex hormone) was prepared which had only $\frac{1}{16}$ of testosterone's sex hormone activity but was as active as testosterone as an anabolic agent. This hormone could be used in aiding the rebuilding of human tissue in many diseases. Another steroid hormone (11 β , 17 β dihydrox-9 α fluoro-17-methyl-4 androsten-3-17-one) was synthesized which was 10 times as potent as methyl-testosterone as a sex hormone and 20 times as effective as an anabolic agent. Another tailor-made steroid hormone reported during 1956, was 19-nor-17 ethyl-testosterone. This compound was the most potent orally effective progestational hormone, and it appeared that it might find considerable use in the prevention of habitual abortions.

Two new factors affecting insulin concentration in the blood were studied. A specific proteolytic enzyme which breaks down insulin was found in liver and other tissues. This enzyme was named insulinase, and it attracted considerable attention since its activity could be at least part of the explanation for the need for continual insulin production. Some success was reported in efforts to synthesize chemical compounds which could specifically inhibit this enzyme. It was hoped that these compounds could be administered orally to some diabetics who, although producing some insulin, still needed injections of supplementary amounts of insulin. An additional factor in regulating the insulin level in severe diabetes was also discovered. It was found that during acidosis, which occurs in an uncontrolled diabetic, an abnormal protein appears in the globulin fraction of the blood which in some manner inhibits the action of insulin. This compound disappears after injection of large amounts of insulin.

The anti-insulin hormone which had been found in some insulin preparations was crystallized and recognized as a new pancreatic hormone. The compound was named glucagon, and causes a remarkable increase in blood sugar when injected. It has a molecular weight of 4,200 and can be considered a protein although it is almost too small to be called a protein. Glucagon does not contain the amino acids cystine, proline or isoleucine, but in contrast to insulin, it does contain both tryptophan and methionine. Considerable progress was made in determining the amino acid sequence in glucagon. It was also reported that glucagon is destroyed by the same liver enzyme which destroys insulin.

A number of experiments on the site of action of insulin were reported. Evidence was presented that insulin both promotes glucose transport into cells and the ability of the cell to metabolize the glucose. However, the specific chemical reaction involved was not identified.

Plant Hormones.—A remarkable new plant growth hormone was chemically identified. After 20 years of work on the "Bokanai" rice disease T. Tobuta and Y. Sumiki in Japan isolated a

crystalline compound which at a concentration of 1 p.p.m. stimulated the growth of rice, wheat barley and tobacco. The compound was named gibberellin A since it was obtained from a fungus called *Gibberella fujikuroi*. Through the recent works of scientists in Japan, the United States and England considerable amounts of the compound (and related compounds) were isolated from fungus cultures, the tentative structure worked out and the biological properties investigated. The structure of gibberellic acid is quite complicated and it appeared that because of this complicated structure it would be prepared by fungus fermentation rather than by chemical synthesis.

Treated with gibberellic acid, ornamentals such as geraniums, sunflowers and roses grew from $\frac{1}{2}$ to 3 times taller than comparable untreated plants. Heights of crop plants such as string beans, peppers and corn in many cases doubled or tripled as the result of similar applications of the chemical. New growth of young forest trees such as willow oak, tulip poplar and maple were greatly increased by treatment with gibberellic acid. Such results were not possible with recent plant hormone regulators. Linear growth is not the only advantage. Additional preliminary work showed that during the early stages of growth, both the weight of fresh dry bean and string bean plants and the amount of solid matter in them are increased 30% to 40% by gibberellic spraying. In some cases flowering was advanced by one to several weeks but in other cases flowering was retarded.

Another important plant hormone known as "kinetin" was also chemically identified. This hormone which promotes cell division in plants, was isolated and synthesized. In plant tissue culture cell enlargement occurs in the presence of indole acetic acid but cell division will not occur unless a source of kinetin is added. Kinetin activity was present in aged or autoclaved preparations of ageing sperm deoxyribonucleic acid, but not in fresh preparations. The active crystalline material was obtained by butanol extraction of autoclaved deoxyribonucleic acid, followed by chromatography on ion exchange resins. Kinetin is active at a level of 0.01 p.p.m. Kinetin was characterized as 6-furfurylamino purine and the structure was proved by synthesis. The biological activity of the synthetic and isolated kinetin were identical.

Chemical Reconstitution of Tobacco Mosaic Virus.—Careful degradation studies revealed details of the structure of the rodlike tobacco mosaic virus. When the protein of the virus was carefully removed by degradation with a detergent, the nucleic acid was observed to lie as a threadlike centre core running the length of the virus rod. The protein portion is apparently the outer overcoat protecting the nucleic acid. In a remarkable experiment, H. Fraenkel-Conrat and R. C. Williams showed that the tobacco mosaic virus may be reconstituted by mixing its two structural components under controlled conditions. Protein obtained from the virus by careful treatment with alkali combined stoichiometrically with nucleic acid obtained from the virus by treatment with sodium dodecyl sulphate to yield nucleoprotein rods containing about 6% nucleic acid and 94% protein and possessing virus infectivity. It also appeared that the nucleic acid of the reconstituted virus rods was located along the central axis of the normal virus rod.

Further evidence regarding the central importance of the virus nucleic acid was made clear when it was found that certain preparations of virus nucleic acid carried a residual infectivity which differed in stability from that characteristic of the regular rod of tobacco mosaic virus. This residual infectivity was found only in very fresh preparations and disappeared when preparations were permitted to stand at room temperature or were subjected to the action of an enzyme which breaks down the nucleic acid. It was concluded that this virus activity is a property of the nucleic acid itself and that the role of the protein is that of a

stabilizer which also determines the immunological properties and perhaps, to a large extent, the host specificity of the virus.

Biochemistry of Cancer.—There was a strengthening of the concept of protein binding as essential to the action of chemical carcinogens. Recent experiments established that the pituitary gland is not essential for carcinogenesis. Remarkable claims were made that viruses can cause mouse leukemias. Some progress was made in immunizing animals against transplanted tumours, and the suggestion was made that humans form antibodies to their own tumours. Increased activity in chemotherapy centred around the evaluation of screening methods, but no new clinically effective drugs were discovered. In spite of intensive work the essential biochemical lesions of cancer remained unknown.

Birth Control. A considerable increase in the number of government grants to support and encourage the spread of family planning programs in underdeveloped countries was noted during 1956. In India, a program for intensive expansion of family planning services, especially in rural areas, was drawn up by the government for inclusion in its second five-year plan. The program called for an expenditure of \$6,300,000 to establish 1,100 health centres providing child welfare and maternity services as well as family planning.

The first elected (1955) representative government of Singapore granted \$28,335 to the Family Planning association of Singapore, which operated 14 clinics whose total attendance numbered 10,168. A government grant totalling \$10,000 was made to the Family Planning association of Hong Kong for assistance in operating a new central clinic and headquarters which were being built by the association. The Hong Kong Family Planning association sponsored nine clinics, serving a total of more than 15,492 women. Under government auspices, an organized campaign for birth control was launched in Egypt, aimed at curbing the country's rapidly rising population. The Population commission's medical committee was charged with opening 12 family planning clinics. Eight clinics opened during 1956.

The government of Japan, which adopted a national family planning program in 1951, allotted nearly \$90,000 in 1956 to teach birth control methods and supply free contraceptives to the indigent; 783 nationally administered health centres gave wide publicity to family planning, and more than 28,600 persons, mostly midwives, took the conception control course offered by the prefectures.

Italy's first consulting office for information on scientific contraceptive methods was opened in Rome under sponsorship of the Italian Association for Demographic Education. The first office of its kind to exist in Italy, the association waged a campaign to overcome religious and political prejudice against birth control, and to repeal Italy's anti-birth control law, adopted by the government in 1930.

Official and unofficial reports were received during 1956 indicating the spread of birth control in the communist world. Hungary approved contraceptives as a means of fighting the

country's abortion menace early in the year. In Czechoslovakia, a treatise on birth control, *Anticonception and the Fight Against Abortion*, was published by the state Health Publishing office.

In Communist China, where the net daily increase in population was 34,000, or more than a third of the entire world's net daily increase, the government, in a sharp departure from communist policy, launched an all-out birth control program. Twenty-seven birth control information centres were opened in Peking, and it was reported that government newspapers were issuing detailed instructions on the use of contraceptives.

A world-wide essay contest to find a solution to the problem of overpopulation in underdeveloped countries was sponsored during 1956 by the International Institute for Social-Ecclesiastical Research in Geneva, an official Roman Catholic institution. The unprecedented contest offered a \$5,000 prize for the best proposed solutions to the overpopulation problem, within the framework of Catholic principles. The contest prospectus recognized the difficulty of increasing food supplies and raising living standards fast enough to keep up with population growth.

The International Planned Parenthood federation added three new countries to its membership rolls—Belgium, Denmark and New Zealand—bringing the total membership to 18. Other member countries were: Australia, Ceylon, the German Federal Republic, Great Britain, Hong Kong, India, Italy, Japan, the Netherlands, Pakistan, Puerto Rico, Singapore, Sweden, Union of South Africa and the United States.

More than 850 persons attended the 36th annual meeting of the Planned Parenthood Federation of America, held in New York city in May 1956. Annual Lasker awards in planned parenthood were presented to Warren O. Nelson, medical director of the Population council, and Robert C. Cook, editor of the *Population Bulletin*, for their contributions in the field of family planning. There were 110 state leagues and local committees in 29 states and the District of Columbia, including the Margaret Sanger Research bureau in New York, affiliated with the Planned Parenthood Federation of America. (M. Sr.)

Birth Statistics.

The birth record for the United States during 1956 was somewhat above the high level established the year before, according to comparable data for the first eight months. During this period, the number of births rose by 2.5%; however, the 1956 birth rate for the period, 24.5 per 1,000 population, was 0.4% above that for the like period of 1955. For the year 1955 as a whole, the number of births (including an allowance for those unregistered) totalled 4,091,000, with a corresponding birth rate of 24.6 per 1,000 population.

All geographic areas, except the New England states, reported more births during the first eight months of 1956 than in the like period of 1955. There was a wide variation in the birth rates among the individual states. For the entire year 1955 the birth rates varied from a low of 21.4 per 1,000 population in New York and Pennsylvania to a high of 32.6 in New Mexico. The 1955 birth rates per 1,000 population were as follows for the geographic divisions: New England, 23.1; middle Atlantic, 21.4; east north central, 24.8; west north central, 24.6; south Atlantic, 26.3; east south central, 26.8; west south central, 26.9; mountain, 28.7; Pacific, 24.

For Canada, data covering the first eight months of 1956 indicated a very small decrease in the number of births compared with the corresponding period of 1955. For the entire year 1955, according to provisional data, Canada recorded 441,681 births; the corresponding birth rate of 28.4 per 1,000 population was 1% below the rate for 1954. In England and Wales there was an increase of 6% in the number of births in the first half of 1956, compared with the same period of 1955, according to provi-

Table I.—Birth Rates per 1,000 Population in Selected Countries for 1955 and 1954

Country	1955	1954	Country	1955	1954
North America			Luxembourg	16.1	16.3

sional data. For the whole of 1955, births totalled 664,954, and the birth rate was 15.4 per 1,000 population, each being 1% below the corresponding figures for the year before. For Australia 207,677 births (exclusive of full-blood aborigines) were reported for 1955, the birth rate being 22.6 per 1,000 population. In the first quarter of 1956, the birth rate was provisionally reported as 21.9 per 1,000 population, or 2.7% below that for the similar period of 1955. In New Zealand the birth rate of 24.5 for the first six months of 1956 was slightly higher than in the first half of 1955. Birth rates during 1954 and 1955 for a number of countries are shown in Table I.

Childlessness and size of family in the United States vary widely with the occupational status of the husband, according to the data shown in Table II.

Blind, Education of the.

During 1955-56 the advancement of work for the blind throughout the world was highlighted primarily by conferences and by the regional implementation of decisions and recommendations of the several international conferences of recent years. In Oct. 1955 the first Far East Conference on Work for the Blind was held in Tokyo, Jap., with delegates from 11 Asian countries, plus official observers from other nations and nonself-governing territories of the region, the United Nation

Above: The boy bites a flower to taste its beauty

GARDEN OF THE BLIND

Part of the John J. Tyler Arboretum near Lima, Pa., the garden was designed for sightless visitors who are encouraged to pick as well as taste and feel flowers. To make identification easier for the blind, plants were chosen for their odour, texture and shape. The photographs show a blind man and blind boy walking in the garden on a spring day in 1956

Below: The boy learns about a pine tree by feeling its bark

Above: A Braille plate identifies petunias; below, the man guides the boy's hand along the raised dots.

Below: Both enjoy the taste and smell of a mint plant

and its specialized agencies and prominent international non-governmental organizations. Among the decisions of this conference was the recommendation that participating countries introduce new methods for training blind children and adults aimed at their full occupational, social and cultural integration within their home communities (in this area, usually the small rural village), rather than the western type of training which succeeds only in setting the blind of this region even more apart from their indigenous backgrounds.

In recognition of the need for maximum collaboration on regional problems between all countries of the area, the World Council for the Welfare of the Blind established a Standing Committee on the Far East, South, and South East Asia Affairs, composed of one representative from each country and territory of the region.

In Sept. 1956, a national conference was held in India at which emphasis was laid on measures that would expand the field of opportunity for employment of the blind in suitable industrial and rural occupations, a subject of paramount regional as well as national importance.

A number of educational facilities for blind children were established in the far east, notably a new school for the deaf and blind at Jaffna, Cey., to serve the northern provinces of that country, and schools for the blind in Thailand and Indonesia. In common with the recommendation of the Far East conference, all these new schools planned their curriculums to lay special stress on vocational and social preparation for normal life rather than upon academic subjects.

In Africa the research and demonstration centre of the Uganda Foundation for the Blind was providing training in the arts and crafts of the countryside, simple hygiene and African music and dancing, with the support of the United Nations and other international bodies. While this program served only sightless adolescents and adults, it was closely linked with the syllabus of the local school for blind children, to ensure continuity of method and service.

Considerable interest in work for the blind was becoming evident throughout the Arabic world, largely as a result of the pilot demonstration project launched in Cairo, Egy., three years earlier through collaboration of the government of Egypt and the United Nations. Plans were under way for the introduction in 1957 of national co-ordinated programs for the education and rehabilitation of the blind in Syria and Lebanon. Surveys of the British colonial territories of Central and East Africa were undertaken by representatives of the British Empire Society for the Blind.

Concentration upon the solution of regional problems through regional action was also the purpose of the European Seminar on Rehabilitation for the Blind, held in London, Eng., April-May 1956, under the joint auspices of the World Council for the Welfare of the Blind and the World Veterans federation, with the participation of the United Nations and the International Labour organization, and with the Royal National Institute for the Blind and St. Dunstan's acting as joint hosts. Eighteen countries were represented.

The keynote of the seminar was the necessity for close partnership between the statutory and private organizations in the field of adjustment, training and employment of blind adults, as well as the educators of the young blind, so as to provide all possible assurance of complete integration of the sightless into community life.

In Jan. 1956 the Royal National Institute for the Blind opened a new centre for blind adolescents at Hethersett, Reigate, Surrey. The purpose of the new centre was to help young blind persons adjust themselves more easily to the demands of a seeing world and to play their part in that world more effectively, both

at work and in their leisure hours. It was hoped that the eventual entry of these young workers into the labour market would stimulate and encourage new fields of employment for the blind generally.

In the field of literature for the blind, international activity was maintained looking to the acceptance of world uniformity in Braille usage, in furtherance of the program launched initially by UNESCO (the United Nations Educational, Scientific and Cultural organization). Although the last international conference on Braille music notation was held in Paris in 1929, at which time major agreement in this field was accomplished, the intervening quarter of a century made clear the need for more stringent observance of common usage in music notation, and also provision for the representation in Braille of the major forms of non-European music.

During the year, the World Braille council made progress toward the publication of a revised international manual of Braille music notation. A number of difficult problems in the field of orthographic Braille were resolved, and preliminary work on an international system of Braille mathematical, scientific and chemical symbols was started.

New Braille printing plants were installed in Portugal and Uruguay, while the expansion of existing production was undertaken in Formosa and Japan, where the government had assumed full responsibility for the publication of all Braille school texts. The establishment of Indonesia's first Braille printing plant was planned for early 1957.

In July 1956 the congress of the United States amended the authorizing legislation of the act of 1879 "To Promote the Education of the Blind." The original act provided an annual appropriation to the American Printing House for the Blind, Louisville, Ky., for the purpose of supplying school texts and special educational apparatus for use by blind school children throughout the states and territories. The new legislation permitted the extension of these services to all blind children, wherever they might be educated in public educational institutions, not just schools and classes for the blind, and increased the ceiling appropriation authorization from \$260,000 to a total of \$410,000. It was estimated that in 1956 there were about 9,000 blind children of school age in the United States.

Following several years of preliminary planning, a conference composed of representatives from Europe and the middle east met in Paris, Fr., in April 1956, under the auspices of the American Foundation for Overseas Blind, to select a medium of recording that could be generally adopted for the publication of "talking books" throughout the region, to determine the technical requirements involved in ensuring maximum interchange of recorded literature between countries, and to prepare an international plan for the mass duplication and distribution of books recorded in the several countries. At this meeting, magnetic tape was selected as the common medium, and each country was made responsible for selecting the book titles and for making the original master tapes.

In Feb. 1956 the first national workshop on problems relating to vocational training and employment for deaf-blind adults was held in New York city, under the sponsorship of the American Foundation for the Blind. The particular phases discussed included the necessity of promoting public interest in hiring deaf-blind adults, and a thorough understanding of the many problems confronting placement workers in finding gainful employment for the deaf-blind.

(F. E. D.)

Blood, Diseases of the. A panoramic picture of haematology in 1956, representing the fields in which the most rapid advances had been made,

was presented at the 6th Congress of the International Society of Hematology and the International Society of Blood Transfusion, held in Boston, Mass., in Aug.-Sept. 1956. The congress was attended by 1,500 physicians from all over the world.

Leukemia.—Causative factors in leukemia received considerable attention. Shimkin's statistics indicated, as did those of others, a considerable increase in the incidence of leukemia in the past 30 years. Possible factors, as quoted by Hausmann, of Germany, were exposure to X-rays and to certain chemicals, notably benzol. There was some indication that leukemia was more common in Jews than in Gentiles, and in whites as compared with Negroes. In South Africa, Greig demonstrated that leukemia was far more common in the Bantu than in whites.

O. Schwartz's studies (Chicago, Ill.) indicated, as did those of others, that viruses were the cause of leukemia in rats and possibly in humans. All observers agreed that X-ray exposure—either with therapeutic or large diagnostic dosage, or as one large exposure (atomic bombs) or by the continued injection of radioactive isotopes—could be productive of leukemia. It was noted by both U.S. and Soviet observers that certain cancer-producing chemicals, notably methylcholanthrene, could also produce leukemia in rats.

Several fundamental differences between leukemia and non-leukemic cells were discussed. Unfortunately, no single criterion distinguishing a leukemic cell from a normal one was established.

In the treatment of leukemia, chemical methods were emphasized, notably the use of urethane in myeloma, that of myleran in chronic granulocytic leukemia, that of CB-1348 in lymphoid leukaemias and leukemia, and of even newer principles, such as CB-139, of recent German origin. It was emphasized that a comparative study of chemotherapy in acute leukemia was a most desirable thing, and a detailed plan for such a study was outlined. According to Osgood, a comparative study of various methods used in the treatment of acute leukemia indicated that the steroids (cortisone and the like) had significantly improved the total survival and the period of activity after treatment. Massive doses of steroids, notably meticorten, were of distinct value in some cases, particularly of the acute variety. In a general review of the treatment of acute leukemia, Whitby emphasized that none of the present-day methods were particularly satisfactory, and that other modes of attack of the leukemia overgrowth were urgently needed.

Nucleonics.—From two standpoints, radioactivity came to the forefront: (1) the use of radioactive isotopes for "tagging" blood and tissue cells and following along what happened to them; and (2) the harmful effects of radioactivity, chiefly on the blood-forming organs. By the use of tracer or tagging techniques, it became possible to study rates of formation and destruction of the various cells of the blood, and to peer into the cell's interior, thus getting an indication of its metabolism or functional state. Thus, iron, vitamin B₁₂, and radioactive chromium were of considerable help, together with other isotopes, in studying what happened to cells and what went on inside of them. Studies of the disturbed physiology in pernicious anaemia were carried much further than previously by the use of radioactive isotope ⁶⁰B₁₂ (Schilling test).

Harmful effects of radiation by X-ray received considerable attention. British workers reported on the development of leukemia following X-ray treatment for ankylosing spondylitis (rheumatism of the spine). E. P. Cronkite, of Brookhaven National Laboratories, reported on the harmful effects of radioactive fallout, observed chiefly on the blood. These effects persisted to a greater or less extent for at least a year. Whether they might potentiate in leukemia, as after the atomic bombs, was subject to speculation. Watanabe, of Hiroshima, Jap., demonstrated that continued administration of small doses of radioactive sub-

stances to animals was productive of leukemia.

Polycythaemia vera, a chronic disorder of increased productive activity of the whole bone marrow, resulting in excessive blood, was thoroughly reviewed and its end-results analyzed. Whether radioactive phosphorus was in the long run the best method of therapy was not settled.

Spleen.—This mysterious organ was fully discussed by a group of ten speakers. It was found that the spleen removed various particles from the red cells, as well as deformed or unusually small red cells themselves. That the spleen "trapped" such cells was shown by isotope studies; the big spleen became an immense trapping organ. Over-activity of the spleen (hypersplenism) resulted in changes in all the blood cells, either because too many were destroyed or their production interfered with. The spleen was concerned with the development of immune antibodies, and in very young children removal of the spleen was shown to result in the tendency to severe infection. Removing the spleen was of utmost importance, in fact curative, in many obscure haematological problems.

Haemorrhagic Disorders.—Haemophilia, the classical form and the various newly discovered types (PTC deficiency or Christmas disease, PTA deficiency and Hageman factor deficiency) was studied. These conditions were due to low concentrations in the blood of some individuals of normal plasma factors, although in some cases clotting inhibitors were present. As yet, no purified constituent of normal blood suitable for the continued injection into the haemophiliac had been developed, although investigations were continuing. Unfortunately, some individuals with haemophilia receiving frequent blood transfusions developed an antibody against normal blood, thus making the problem even more difficult. The rare occurrence of haemophilia in the female was demonstrated.

Platelets, the third element of the blood cells, are concerned with keeping the blood within the circulation and with initiating clotting. Chemical and metabolic studies of these small bodies, hitherto lacking, were revealed, and these might have considerable importance in storage of platelets for use during an emergency. It was shown by E. Klein that flash drying (lyophilization) of platelets allowed storage for many months and subsequent use in haemorrhage when salt solution was added. The platelet precursors, the huge megakaryocytes of the marrow, were studied by motion-picture techniques by both French and Japanese workers.

An unusual bleeding disturbance known as fibrinolysis, in which the blood clot, although formed, becomes quickly dissolved, was discussed as a frightening disorder during some cases of childbirth. The possibility of dissolving blood clots, as in coronary thrombosis, was discussed by Ambrus and co-workers on the basis of experimental work with dogs, and another group of workers actually worked with a purified clot-dissolving agent, streptokinase. In addition, a number of papers describing various new anticlotting factors were presented.

Anaemia.—The anaemias arising from a deficiency of various factors, including pernicious anaemia, sprue and others, were discussed, first from the historical standpoint and then from the metabolic and chemical standpoints, notably B₁₂ and folic acid relationships. The remarkable advances in knowledge of diseases resulting from abnormal haemoglobins (sickle cell anaemia, haemoglobin C, D, E, G, H, I, etc.) were presented in considerable detail, with emphasis on their heredity, geographic relationships and interactions of one abnormal gene with another. Another subject of considerable interest was discussed fully—that of the erythropoietic hormone, a substance stimulating red cell production. This was discovered recently in the blood plasma of anaemic animals and could cause increased red cell production in normal animals. It was, of course, hoped that further develop-

ment of such a substance might be of future value in the treatment of anaemias not responding to presently known factors. The refractory anaemias associated with disturbances of the bone marrow, and particularly in association with tumours of the thymus gland, were also of considerable interest.

Immunohaematology.—In some blood disorders, the body apparently develops substances that attack its own blood cells (autoantibodies). Red cells, white cells, platelets and small blood vessels may be so attacked, resulting in the various kinds of anaemia and in conditions of low white cells, low platelets and so on. The last decade had seen considerable advance in this field, with the result that many mysterious disorders, notably systemic lupus erythematosus, were far better understood.

Haematology of recent years had been characterized by increasing knowledge of the chemistry and metabolism of the blood cells, and the control of such serious disorders as leukemia, haemophilia and the haemoglobinopathies was a distinct possibility once the chemical defects could be conquered.

Bobsledding. Stan Benham, veteran driver from Lake Placid, N.Y., scored a sweep of the major events on the Mt. Van Hoevenberg run at Lake Placid in Feb. 1956. Benham who in 1955 drew a three-year suspension from international competition, teamed with Pat Martin of Massena, N.Y., to dominate United States competition for the season. Martin had withdrawn from the U.S. Winter Olympics' bobsledding team in protest against the barring of Benham. On Feb. 18, 1956, Benham and Martin, competing in a heavy snowstorm, won national Amateur Athletic union two-man honours with a total time of 5 min. 3.86 sec. for four runs down the mile-long slide. John Helmer of Lake Placid and Henry Sterms of Saranac Lake, N.Y., placed second. The next day, Benham, riding with Chuck Randolph, Helmer and Martin carried off the national four-man award. Their elapsed time for the four heats was 4 min. 47.95 sec.

In the North American A.A.U. two-man championship tests of Feb. 25, Benham and Martin again dominated the field, triumphing with a total time of 5 min. 14.73 sec. Joe Meconi and Don Burrell of Ausable Forks, N.Y., took second place in 5 min. 17.22 sec. On Feb. 26, Benham and his teammates Martin, Ran-

dolph and Helmer, won the North American four-man crown in 4 min. 44.38 sec. Earlier in the campaign, Benham had scored victories in the J. Hubert Stevens memorial trophy races and the Adirondack A.A.U. championship meet. (See also **OLYMPIC GAMES.**) (T. V. H.)

Bolivia. Bolivia is a landlocked republic in south central South America. Area: 424,162 sq.mi.: pop. (1950 census) 3,019,031; (1955 est.) 3,198,000. The legal capital is Sucre, pop. (1950 census) 38,400; the actual seat of government is La Paz, pop. 266,763. Other major cities (with pop., 1950 census) include Cochabamba 74,949, Oruro 58,706, Potosí 43,579, Santa Cruz 34,005 and Tarija 16,474. Racial distribution is estimated to be 52.34% Indian, 27.5% mestizo, 13.08% white, 0.22% Negro and 6.85% unspecified. Religion is predominantly Roman Catholic. Presidents in 1956: Victor Paz Estenssoro, until Aug. 6; thereafter Hernán Siles Zuazo.

History.—Grave economic difficulties and festering political resistance beset the administrations of Pres. Victor Paz Estenssoro and his successor, Hernán Siles Zuazo. Increased revenues from the Camiri oil fields and economic assistance from the United States government staved off fiscal disaster. In political affairs, the government party, the National Revolutionary Movement, maintained uneasy control, in spite of pressure from the leftist Central Labor organization and disaffection by the right-wing Socialist Falange.

The most hopeful sign on the economic scene was rising oil production. The government announced in April that production of petroleum was 11 times greater than it had been in 1952. Official efforts to attract foreign investment capital led to the signing of a 40-year contract with the Gulf Oil corporation, which agreed to build a system of pipelines from the Bolivian oil fields to the Pacific ocean in exchange for extensive exploration and exploitation rights. Agreements were made with other operators for distribution of automotive gasoline to Chile and Peru, and for supply of natural gas to Chilean copper mines.

United States economic support for Bolivia took the form of tin purchases, sales of surplus foodstuffs, aid to the national highway construction program, and technical assistance.

Vice-Pres. Siles Zuazo was overwhelmingly chosen in elections on June 17 to succeed Pres. Paz Estenssoro. The National Revolutionary Movement candidate was supported by Juan Lechin, leader of the powerful Central Labor organization, whose demands for a majority representation in congress had provoked a temporary rift in the party in April. The chief opposition party, the Socialist Falange, charged the government with fraudulent electoral practices and unofficially withdrew its candidate, Oscar Unzaga de la Vega, three days before the election. The "Trotskyist" Revolutionary Workers' party and the Communists lost legal status for failing to obtain at least 4% of the total vote.

Siles Zuazo was inaugurated on Aug. 6 and promised to protect democratic institutions, fight inflation, diversify the country's economy and attract foreign capital. One of his first official acts was to promulgate a law calling for the creation of a new constitution. In September, 4,000 citizens of La Paz demonstrated against inflation, burning the pressroom of the government daily, *La Nación*, and the studios of Radio Illimani. The president attributed the violence to the Socialist Falange and ended the policy of national pacification proclaimed upon his inauguration.

(R. HN.)

Education.—In 1952 there were 234,000 primary school pupils, 24,000 secondary school pupils, 6,000 technical school pupils and 2,000 normal school pupils. There were universities with more than one faculty at Cochabamba, La Paz, Oruro, Potosí and Sucre. According to the 1950 census, 68.9% of those 5 yrs. of age and over were illiterate. Education was scheduled to receive 15% of governmental expenditures in 1956.

Finance.—The monetary unit is the boliviano, valued during 1956 at

U.S. BOBSLED TEAM testing the run at Cortina d'Ampezzo, It., before the opening of the Winter Olympic games held there in 1956

0.52 cents U.S. currency, official rate, and on July 26, 1956, at 0.01 cents, legal free rate. The 1956 budget estimated revenue at Bs. 72,500,000,000 and expenditure at Bs. 74,000,000,000. The public debt on Dec. 31, 1953, was placed at Bs. 37,487,400,000, including the foreign debt amounting, with accrued interest, to the equivalent of Bs. 30,487,400,000. Currency in circulation on Dec. 31, 1955, totalled Bs. 38,320,000,000; demand deposits, Bs. 33,940,000,000. The U.S. department of commerce estimated U.S. direct private investments in 1955 at \$11,000,000. The cost-of-living index at La Paz stood at 415 in June 1955 (1953=100).

Trade and Communications.—Exports in 1955 (excluding gold) were about \$98,100,000 (1954: \$94,300,000); imports, \$82,400,000 (1954: \$65,500,000). Leading exports in 1955 were tin (60%), tungsten (16%), lead (7%), zinc (6%) and silver (5%). Important imports in 1954 included wheat (8%), sugar (8%) and mining machinery (7%). Leading customers in 1954 were the U.S. (54%) and the U.K. (33%); leading suppliers, the U.S. (38%), Argentina (12%), Peru (11%), the U.K. (7%) and Germany (6%).

Railway lines in operation (1955) totalled 1,690 mi. The length of the highway system was officially placed at 9,806 mi. in 1955. Motor vehicles on Jan. 1, 1954, included 6,128 automobiles, 14,962 trucks and 791 buses. Telephones (Jan. 1, 1955) numbered 11,400, 94.3% of which were automatic.

Agriculture.—Important crops included wheat, maize, barley, rice, potatoes and cotton. Official livestock estimates (1955) showed 2,259,000 cattle, 6,464,000 sheep and 436,000 pigs; in 1951 there were an estimated 1,800,000 llamas and alpacas. The principal exploited forest products were rubber and cinchona bark.

Manufactures.—According to statistics compiled by the National Chamber of Industries (La Paz), there were 1,320 factories in 1950 with gross value of production amounting to \$28,300,000. Most important, in terms of value of production, were textiles and clothing, beverages, foodstuffs and chemicals. Production estimates for 1955 included cement 37,000 metric tons, cotton textiles 9,500,000 metres and flour 53,700 tons. Installed electric energy capacity in 1955 was 87,450 kw., production was about 355,000,000 kw.hr.

Minerals.—Production in 1955 included tin 27,636 metric tons, wolfram (tungsten) 2,434 tons, lead 21,354 tons, zinc 18,506 tons, silver 5,851,107 fine oz., copper 3,518 tons, antimony 5,287 tons. Production of crude petroleum was 2,693,000 bbl.; crude oil refined totalled 2,124,084 bbl. (J. W. Mw.)

Book Collecting.

Of the thousands of books and manuscripts which passed through the market during 1956, only three excited international attention. One was Susanna Rowson's *Charlotte Temple: A Tale of Truth*, the first American best seller, issued at Philadelphia in 1794 and thereafter reprinted in at least 200 editions. Though it had long been known that the original edition was printed at London in 1791, no copy had ever been reported before the one recently discovered in England and now deposited in the C. Waller Barrett collection. Another item was *The Capitall Lawes of New-England*, a Puritan code based exclusively on biblical commandments. This broadside, first printed by the Massachusetts Bay Colony in 1642, was known only by two copies of the London 1643 reprint, one at the British Museum and the other at the library of Lincoln Cathedral. By permission of the cathedral trustees, and with the concurrence of the British government, the second copy was acquired by the West Publishing company, St. Paul, Minn., for presentation to the Harvard law school library. Governmental intervention, however, prevented the export of another treasure, the 1576 manuscript of Thomas Whythorne, commonly recognized as the earliest-known English autobiography. This manuscript, purchased by James M. Osborn, was given to the Bodleian library.

Two caches of manuscripts also aroused the interest of scholars. One collection, discovered in Egypt, comprised 13 papyrus books written in the 4th century by adherents of the Coptic religious sect known as Gnostics. Of significance comparable with that of the Dead sea scrolls, these specimens were otherwise noteworthy as the most ancient writing to be bound in leather and the first on papyrus to be found in the shape of books. The other cache, discovered at the Château de la Grange, near Paris, consisted of thousands of letters and personal papers of the marquis de Lafayette. By 1957, the 200th anniversary of Lafayette's birth, the owner, Court René de Chambrun, planned to have a museum constructed for their exhibition. Still another cache was expected in the tomb of Sir Thomas Walsingham,

which it was believed might prove that Christopher Marlowe wrote Shakespeare; but the vault revealed nothing, not even the remains of its presumed occupant.

The affairs of collectors were in two instances the subject of protracted controversy. In the United States a district attorney contended before the federal court in St. Paul, Minn., that the manuscript notes of Capt. William Clark (of the Lewis and Clark expedition) belonged not to the heirs or to any local society but to the national government. As this claim had far-reaching implications, both for collectors and private institutions, a decision was anxiously awaited. In England the activities of a "book ring," a collusive group which depressed the bids for books desired by its members, were twice debated in parliament and finally charged by the Antiquarian Booksellers association as an offense subjecting its members to expulsion. Against this unethical if time-honoured scheme to control the prices at auction may be set the ingenious method for raising them at a sale held at Wellington, N.Z. There on May 17 many common books were bid to extravagant heights by representatives of various Auckland libraries, all of whom were bound to spend money at this auction or forfeit a legacy bequeathed to them by the very man whose books were on sale.

The year marked the 500th anniversary of the Gutenberg Bible (first published in the winter of 1455-56), an event celebrated in various exhibits and monographs. Also celebrated was the 250th anniversary of Benjamin Franklin's birth, the 100th of Sigmund Freud's and George Bernard Shaw's and, on Feb. 17, the centennial of Heinrich Heine's death. On that day it was announced that a private collector had given to the city of Düsseldorf, the poet's birthplace, more than 3,700 of Heine's manuscripts.

Admirers of Henry Wadsworth Longfellow suffered two grievous losses, first in the destruction by fire of the old Wayside inn at Sudbury, Mass. (scene of the famous *Tales*), and second in the demolition of the poet's birthplace at Portland, Me. On the foundation of the inn, however, the Ford foundation intended to construct a replica; and from the wreck of the home the inner trim was carried off to Bowdoin college, where Longfellow began his teaching career. At Concord, Mass., state and town officials dedicated a reconstruction of the "rude bridge," scene of the shot "heard round the world." (W. B. Tb.)

Book Publishing and Book Sales.

The number of new books and new editions published in the United States between Oct. 1955 and the end of Sept. 1956 totalled 12,524, continuing the upward trend. The total for the calendar year 1955 was 12,589 titles, up 688 over 1954 and topping the 1953 high in book production, which was 12,050 titles. The figures for the first nine months in 1956 showed a decrease of 65 titles for the period. Fiction titles for January through September totalled 1,608 in 1956 compared with 1,529 in the same period of 1955, while juveniles dropped to 989 from 1,005. Technical books were up to 369 against 322 a year before, while business titles dropped to 198 from 226. Religious titles were up 613 compared with 582. For the calendar year 1955, with its gain of 688 titles, the largest increases were in biography, general literature and criticism, juveniles and science. Decreases were in fiction and religion.

Best Sellers.—The best-seller list as of September is seldom the same as the year-end list because of the heavy bookstore sales in the last three months of the year. For instance, in 1955 *Andersonville* by MacKinley Kantor was third on the final fiction list of best sellers, but had no chance to appear on a September list as it was not published until late October, as was also the case with *The Tontine* by Thomas B. Costain and *Ten North Frederick* by John O. Hara, which were ninth and tenth on the

final list.

In Sept. 1956 *Don't Go Near the Water* by William Brinkley led the fiction list, followed by Françoise Sagan's *A Certain Smile* and *The Last Hurrah* by Edwin O'Connor in the second and third spots, according to reports from 60 booksellers in various parts of the United States. Then followed *Auntie Mame* by Patrick Dennis, *Andersonville*, *A Single Pebble* by John Hersey, *A Thing of Beauty* by A. J. Cronin, *The Mandarins* by Simone de Beauvoir, *The Ninth Wave* by Eugene Burdick and *Charmed Circle* by Susan Ertz.

In nonfiction a 1951 "sleeper" entitled *Arthritis and Common Sense* by Dan Dale Alexander flared to top popularity in 1956 through recommendation of a television program. Following it were *Profiles in Courage* by John F. Kennedy, *Eisenhower: The Inside Story* by Robert J. Donovan, *How to Live 365 Days a Year* by John A. Schindler, *The Nun's Story* by Kathryn Hulme, *The Mind Goes Forth* by Harry Overstreet and Bonaro Wilkinson (Overstreet), *Love or Perish* by Smiley Blanton, *Guestward Ho!* by Barbara Hooton and Patrick Dennis (the latter of *Auntie Mame* fame), *Youth* by Arnold L. Gesell, and *Roosevelt: The Lion and the Fox* by James Burns.

Book Sales.—The *Publishers' Weekly*, in its annual 1956 fall announcement number, reported that U.S. publishers were enjoying "their fourth consecutive year of general prosperity." Of 72 publishers answering its questionnaire, 54 reported that business for the first six months of 1956 was better than it had been in a comparable period in 1955. The only two publishers reporting lower sales were firms that had spectacular best sellers early in 1955.

The preliminary report from the 1954 U.S. Census of Manufactures was released in Sept. 1956. These still partly tentative figures about book publishing and production showed an increase of 44% in total sales of books and pamphlets by publishers and others between 1947 and 1954. Prior to this 1954 survey, the last Census of Manufactures covered the year 1947. In this interim period the American Book Publishers council and the American Textbook Publishers institute had had industry figures prepared which in some instances differed from the Census of Manufactures because of varying bases for compiling data.

The census data indicated a preliminary figure of the dollar volume of books and pamphlets sold by publishers in 1954 to be more than \$658,576,000 compared with \$445,790,000 in 1947. Book sales alone were reported to be \$621,696,000 in 1954 as against \$435,134,000 seven years before.

The total number of books sold in 1954, according to the preliminary census report, was 704,712,000, representing \$621,696,000. Of this total adult trade books in original editions totalled 43,765,000 copies worth \$75,280,000, of which 31,301,000 were hard-bound (worth \$70,304,000) and 12,464,000 were paper-bound (worth \$4,976,000). Reprint editions of adult trade books totalled 157,044,000 copies for which \$71,890,000 was received. Of these 41,121,000 were hard-bound (worth \$46,621,000) and 115,923,000 were paper-bound (selling for \$25,269,000). It should be noted that differences between census and industry estimates of paper-bound books might bring about a revision of these figures. Adult trade book sales, originals and reprints, hard-bound and paper-bound, showed a 113% increase in dollar sales. The number of copies of original editions of adult trade books, hard-bound and paper-bound, showed a 34% increase.

Juveniles (excepting toy books) hard-bound and paper-bound, original and reprint editions, totalled 220,114,000 representing \$50,835,000. This showed an increase in dollar receipts from 1947 to 1954 of more than 150%, according to the census survey, and the number of copies sold had tripled.

According to the preliminary census figures, textbooks increased in dollar income in the years between 1947 and 1954 by

43%, with school workbooks more than doubling in dollar value. Sales of technical and related books reportedly rose 37% in dollar volume though the increase in number of copies sold was less than 10%.

Dollar sales of Bibles and Testaments more than doubled, 1947 to 1954, according to the census survey, while the number of copies sold in this category increased not quite 23%.

No recent figures were available on retail book sales.

Book Prices.—According to the *Publishers' Weekly* report published Dec. 31, 1955, there was a negligible increase in the average retail price of novels during 1954-55, a 14% rise in the average price of biographies, and a 4.5% rise in the average history book price.

Average retail prices	1955	1954	1953	1952	1951	1950	1949	1941
Novels	\$3.53	\$3.50	\$3.29	\$3.26	\$3.03	\$3.02	\$2.86	\$2.58
Biography	5.03	4.40	4.67	4.66	4.03	4.47	3.98	3.30
History	5.81	5.56	6.04	5.45	5.68	5.21	5.06	3.89

(Not counted among novels tabulated were mysteries, westerns, science fiction and anthologies.)

Paper-Bound Books.—The 1954 preliminary figures from the Census of Manufactures give 128,387,000 as the number of copies of paper-bound books sold in that year, of which 12,464,000 were original editions and 115,923,000 were reprints. This figure was 52,000,000 below the industry's estimated figures, which had run as high as 240,000,000 paper-bound books distributed in 1953 and 300,000,000 in 1955. The census reported a dollar total of \$30,245,000 for these books, which was some \$3,000,000 below the industry's own estimate. The catalogue of *Paperbound Books in Print* listed 5,400 titles available in about 80 paper series in its fall 1956 issue, as compared with 4,500 titles from 40 publishers in its first issue in the summer of 1955.

Boston. Boston, the capital city of the commonwealth of Massachusetts, was founded in 1630 and was incorporated by an act of the legislature of Massachusetts in 1822. The municipal government of Boston is administered by a mayor, a city council of nine members and a school committee of five members. The mayor is elected for a four-year term, and city council and school committee members are elected at large for terms of two years.

The population of Boston, according to the 1950 federal census, was 801,444, and the land area of the city is 47.81 sq.mi. The city is located in Suffolk county on the Atlantic coast and has excellent harbour and shipping facilities.

The gross funded debt of the city was \$120,778,500 as of Sept. 30, 1956. Sinking fund provisions had been made to meet these obligations in the amount of \$65,759,503, leaving a net funded debt of \$55,018,997. The 1956 tax rate was \$78.70 per \$1,000 of assessed valuation and was levied on real estate and personal property evaluated at \$1,517,808,000. The total tax levy for 1956 was \$119,451,490. The number of municipal employees as of Feb. 1, 1956, was 22,904.

The enactment by the legislature of the commonwealth of Massachusetts of a statute creating the Massachusetts Port authority was the most outstanding and significant development of concern to Boston and the metropolitan area during the year. The legislation brought together under one supervisory authority

and ownership properties owned by the city, state and private individuals. Properties involved were the Sumner Traffic tunnel, a two-lane vehicular traffic tube, running beneath Boston harbour between Boston proper and East Boston; the Logan airport, a state-owned air facility in East Boston; wharves, warehouses and docking facilities of the Boston Port authority, also state-owned; and the Mystic River bridge, a privately owned two-level vehicular bridge crossing between Boston and Chelsea. In addition to acquiring the above-named properties, the authority was also to construct an additional vehicular crossing between Boston proper and East Boston.

The Massachusetts Port authority was created a body politic and corporate and constituted a public instrumentality having the exercise of broad powers. Among the powers conferred was the right to issue revenue bonds, the proceeds of which would be used in payment for the acquisition of the properties described above and the construction of another traffic tunnel. The revenue bonds issued were payable solely from the receipts from tolls, rates, fees, rentals and other charges for the use of any project under the control of the authority and did not constitute a debt or a pledge of the faith and credit of either the city of Boston or the state.

Another significant development in Oct. 1956 was the taking over by the Metropolitan District commission, a subdivision of the state government, of ten miles of city roads. The acquisition of these highways and others taken over in 1949 completed an arc-shaped pattern of boulevards extending from the mouth of the Neponset river, Dorchester, around Jamaica pond, to the Charles river basin, Back Bay. The roadways transferred were located in Dorchester, Hyde Park, Roxbury, Jamaica Plain and the Back Bay, all sections of the city of Boston. Upon completion of expressways through downtown Boston and Dorchester, Boston would be completely circled by a state-Metropolitan District commission belt line of highways. (J. P. Lv.)

ENCYCLOPEDIA BRITANNICA FILMS.—Massachusetts (1955).

Botany. The golden anniversary of the Botanical Society of America was celebrated in 1956 at its annual meeting held at the University of Connecticut. Some time was devoted to a review of past accomplishments in botany, but for the most part, the society members were concerned with matters which promised to be of significance in the coming half century.

During the year plant physiologists and horticulturalists focused their attention on growth regulators, particularly on a new group known as gibberellins. These substances, which were isolated initially from the fungus *Gibberella fujikuroi*, resemble auxin in promoting stem elongation, respiration and possibly water uptake, but they lack other actions attributed to auxins and are not inhibitory at higher concentrations. P. W. Brian and A. G. Hemming using gibberellic acid increased to normal the stature of genetically dwarfed peas, and B. O. Phinney obtained similar effects with four of six dwarf mutants of maize which would not respond to auxin. The gibberellins also are able to eliminate the cold requirement for flowering in *Hyoscyamus niger* according to A. Lang, while A. M. Kofranek and B. O. Phinney demonstrated that the same substances hasten the flowering of China asters. These various effects are of both practical and theoretical importance, hence it is significant that Phinney was able to extract substances with similar properties from the tissues of higher plants. (See also BIOCHEMISTRY.)

Meanwhile O. V. S. Heath and J. E. Clark were able to duplicate auxin promotion of cell elongation and inhibition of root growth with chelating agents. The effects of auxin and EDTA (a chelating agent) were additive although some interaction occurred in the case of root growth inhibition. The authors speculated that auxin action may involve chelation, especially with Cu⁺⁺

or Co⁺⁺. This work became particularly interesting in view of the promotion of auxin action by cobalt which had recently been examined by K. V. Thimann and of the demonstration by W. R. Briggs and M. Ray that tyrosinase, a copper-requiring enzyme system, is able to inactivate auxin.

The association of scopoletin with differentiation was reinforced by Katharine Tryon's observation that cultures of tobacco callus which formed differentiated shoots contained much more of this lactone than did undifferentiated cultures. Another group of compounds, the leucoanthocyanins, were implicated in growth regulation when F. C. Stewart and E. M. Shantz found them among the constituents of coconut and buckeye endosperm which promote cell division in tissue cultures.

The study of the origin of cultivated plants continued to occupy a number of investigators. New taxonomic scoring methods developed largely by Edgar Anderson, as well as cytogenetics, were widely used. The bread wheats are hexaploids with three distinct sets of chromosomes. It had been well-established that one set of chromosomes comes from *Aegilops squarrosa* and a second set from the diploid einkorn wheats but there had been no agreement as to the source of the third set. On the basis of morphological comparisons P. Sarkar and G. L. Stebbins came to the conclusion that the third set comes from the wild grass *Aegilops speltoides* of Asia Minor. The possible role of the wild *Cucurbita lundelliana* of South Mexico and Central America in the origin of the five cultivated cucurbit species (squashes, gourds and pumpkins) was pointed out by T. W. Whitaker. The five cultivated species are for the most part cross-incompatible but it is remarkable that all five have been found to be cross-compatible with *C. lundelliana*. The major source of the cultivated banana is supplied by *Musa acuminata*, according to N. W. Simmonds and K. Shepherd. Previously it had been assumed that *M. balbisiana* was also a direct source of the cultivated bananas but this hypothesis offered difficulties since no edible diploid forms of this species are known. Simmonds and Shepherd suggested that the latter species has contributed to the evolution of the bananas only through hybridization with *M. acuminata*. The taxonomy and origin of the potato, *Solanum tuberosum*, was further clarified by the work of J. W. Hawkes. He concluded that *S. tuberosum*, a polyploid, was derived from a cultivated diploid species, possibly *S. stenotomum*.

The vascular plants were long considered to have originated in post-Cambrian times, but in recent years small fragments of wood and spores recovered from Cambrian sediments suggested the occurrence of vascular plants in the Cambrian. Skepticism as to the actual presence of vascular plants in that period remained until Kryschtowitch in 1953 discovered a lycopodiaceous plant in the Middle Cambrian of East Siberia. In commenting on this discovery S. Leclercq pointed out that this lycopsid is structurally more complex than any of the Psilophytales which had long been thought to be the most primitive vascular plants and occurs at an earlier horizon than any known members of the latter group. He further pointed out the great differentiation of the new fossil suggests a long evolutionary history for the lycopsids and definitely separates the origin of the lycopsids from that of the Psilophytales.

Further investigation of several destructive plant diseases led to observations which might aid in their eventual control. It was thought that squirrels might be important vectors of the oak wilt disease which threatens oaks throughout the nation. E. B. Himelick and E. A. Curl observed that gray and fox squirrels tear bark from infected oaks to feed on fungal "mats" beneath. Subsequent gnawing of healthy plants results in infection.

The agent of the disease "wildfire" of tobacco (*Pseudomonas tabaci*) damages its host, according to A. C. Braun, through the release of a toxin which interferes competitively with the utiliza-

tion of the amino acid methionine. The toxin is structurally similar to methionine.

Smog damage to plants was previously attributed to the action of ozone on unsaturated hydrocarbons released by industrial processes and by natural decomposition of leaves. L. C. Erickson and R. T. Wedding demonstrated that ozonated hexene can reduce photosynthesis, stimulate respiration and alter semipermeability, thus accounting in large measure for the deleterious effects of smog.

New Books.—*Plant Taxonomy*, by Earl L. Core; *Chromosome Botany*, by C. D. Darlington; *Chromosome Atlas of Flowering Plants*, by C. D. Darlington and A. P. Wylie; *Trees, Woods and Man*, by H. L. Edlin; *Modern Methods of Plant Analysis*, by K. Paech and M. V. Tracy.

(C. W. HN.; C. B. HR.)

Arboretums and Botanical Gardens.—*United States.*—Increased public interest in arboretums was shown throughout the United States in 1956. Longwood gardens at Kennett Square, Pa., the former estate of Pierre S. du Pont, adopted a vigorous program of lectures and displays to encourage the public to view this 1,000-ac. wonderland of plants growing both outdoors and in the largest greenhouse display area in the world.

Kingwood Center of Mansfield, O., although it had been open to the public as a garden centre for only three years, also started an extensive program of planting (about 130,000 Dutch bulbs) and attracted more than 225,000 persons in 1955. More than 800 meetings and tours were scheduled during the same period.

The city of Denver, Colo., adopted a budget for its new arboretum and appointed as its first director Robert L. Woerner, formerly of the Finch arboretum in Spokane, Wash. Plans were proceeding to begin the actual planting of this new arboretum.

Planting Fields foundation at Glen Cove, L.I., N.Y., approved plans and supplied the necessary funds to make a landscape plan, employ a full-time horticulturist and expand the inadequate water system in this beautiful, formerly private estate.

One of the most serious freezes on record occurred in Nov. 1955 in the Pacific northwest which affected all the arboretums and botanical gardens in the area. Thousands of plants had to be cut down or removed entirely from the University of Washington's arboretum at Seattle; rhododendrons and camellias, some 15 years old, were killed.

(D. WN.)

Great Britain.—On Oct. 1, 1956, George Taylor succeeded Sir Edward Salisbury as director of the Royal Botanic gardens, Kew. Work continued during 1956 on the reconstruction of several botanical houses. E. Milne-Redhead and P. Taylor of the Herbarium returned to England on Aug. 13 after making extensive collections in south Tanganyika. Work continued on the *Flora of Tropical East Africa*, the revised edition of the *Flora of West Tropical Africa* and the *Flora of Cyprus*. The new *Flora Zambesiaca*, covering plants of the Central African federation, Mozambique and Bechuanaland, was started, being sponsored by the governments of those countries and by the colonial office.

At the University Botanic garden, Cambridge, Eng., the extension and development of the garden made possible by the Reginald Cory fund was continued. The 20 ac. set aside for incorporation with the garden were cleared, and construction progressed in the laying out of this area. Work on the new rock garden continued, construction of a new laboratory was started, and planting was begun. Taxonomic research continued at the Royal Botanic garden, Edinburgh, Scot. In addition to a check list of the cultivar names of *Rhododendron* (including *Azalea*) compiled by H. R. Fletcher, the assistant keeper, members of the scientific staff worked on the following families and genera: Cintractia, Compositae, Gesneriaceae, Labiatae, Oleaceae and *Rhododendron*. The herbarium of cultivated plants was considerably expanded, and thinning out, replanting and relabelling

were continued. During July and August D. M. Henderson accompanied an expedition to central and northern Spain.

(See also HORTICULTURE.)

(F. N. HR.)

ENCYCLOPÆDIA BRITANNICA FILMS.—*Flowers at Work* (1955); *Fungus Plants* (1931); *A Parasitic Plant* (1931); *Plant Growth* (1931); *Plant Trap* (Insect Catchers of the Bog Jungle) (1955); *Roots of Plants* (1931); *Seed Dispersal* (1931).

Bowles, Chester

(1901—), U. S. author and lecturer, was born on April 5 in Springfield, Mass. He attended Choate school and Yale university, graduating in 1924, worked for a year on the *Springfield Republican* and four years in a New York advertising firm. In June 1929, in partnership with William Benton (*q.v.*), he started the advertising firm of Benton and Bowles, Inc., and in 1936 he became chairman of its board of directors.

In June 1942 he was appointed district director of the Office of Price Administration for the state of Connecticut. Pres. Franklin D. Roosevelt named him national OPA administrator in 1943, and in 1946 Pres. Harry S. Truman made him director of economic stabilization with responsibility for all anti-inflation wage, price and production controls.

In Nov. 1946 Bowles was appointed a U.S. delegate to the first conference of the United Nations Educational, Scientific and Cultural organization in Paris, Fr., and in 1947 he became international chairman of the United Nations Appeal for Children. He was elected governor of Connecticut in Nov. 1948. During the two years of his administration he introduced legislation providing for expansion of public education, housing, welfare and child care programs, labour legislation and reorganization of the state government. He was defeated for re-election in 1950.

President Truman appointed Bowles U.S. ambassador to India and Nepal in Sept. 1951. After the election of Pres. Dwight D. Eisenhower, however, he resigned as ambassador and returned to the United States in early 1953.

Author of *Tomorrow Without Fear* (1946) and the best seller *Ambassador's Report* (1954), he has lectured and written widely in America and travelled extensively in Africa and India. Two later books, *American Politics in a Revolutionary World* and *Africa's Challenge to America*, embodying lectures delivered at Harvard university and the University of California, were of special significance in connection with the 1956 political campaign. A further volume entitled *The New Dimensions of Peace* provided a complete review of the world political scene and was widely acclaimed as a major contribution to the literature of American diplomacy.

(R. R. R. B.)

Bowling.

Bill Lillard of Chicago, Ill., added a page to bowling history in 1956 when he became the first kegler ever to win three titles in one American Bowling congress (A.B.C.) championship tournament. Lillard's 3-game series of 683 helped the Falstaff Beer team gain five-man team honours with 3,092. He scored 674 when paired with Stan Gifford, another Chicagoan, to win the doubles at 1,331, and captured the all-events title with a total of 2,018. When bowling in the 79-day competition at the Rochester (N.Y.) War Memorial building came to a close on May 20, Lillard had earned \$2,180.75 in prizes, a record total for a singles A.B.C. championship competition. George Wade of Steubenville, O., took first place in singles competition with games of 258, 247 and 239 for his winning total of 744. Lillard also was the first bowler ever to win an A.B.C. title and the all-star match-game championship within one year. He dethroned Joe Wilman of Chicago in the all-star championships in Dec. 1955. The Falstaff five also took the Frank Pasdeloup trophy, scoring 9,176 for the all-events, being the only team to go over 9,000.

In the sixth annual masters' tournament held near the close of

the A.B.C. tournament at Rochester, Dick Hoover of Akron, O., was victor, defeating Ray Bluth of St. Louis, Mo., 819-787, in a four-game finale.

Membership in the A.B.C. continued its steady upward trend, the 1955-56 season showing a 17% rise in certified teams, which totalled 439,198. The number of sanctioned leagues rose 19% to 48,149. No one had qualified for admission to the Bowling Hall of Fame in 1956 for the first time in the 15-year history of the hall.

Johnny King of Mayfield Heights, O., who won the National Bowling league television series at Paramus, N.J., in July, gained \$7,500 in additional prizes in the George London tourney at Chicago in September. King defeated Joe Brown of Jersey City, N.J., in the championship match on Sept. 11 with 15.44 Petersen points on a 644 series. Brown rolled 565 for 11.15 points.

The annual championship of the Woman's International Bowling congress was held at Miami, Fla., and ran for 32 days. Doris Knechtges of Detroit, Mich., carried home the all-events laurels for the second time with a score of 1,867. The top singles prize was won by Lucille Noe of Columbus, O., who bowled games of 207, 256, and 245 for a winning total of 708. Betty Maw and Mary Quinn, Buffalo (N.Y.) pair, triumphed in the doubles with 1,242. The team honours were captured by the Daniel Ryan five of Chicago with a 2,880 score.

Duckpins.—The National Duckpin Bowling congress conducted its tourney at Charlotte, N.C., in April and the meet attracted an entry of 832 teams. In the national rankings for 1956,

National Duckpin Champions

Men's singles—Al Burrell, Atlanta, Ga.	430
Men's doubles—August Recchia and Chester Becker, Baltimore, Md.	777
Men's all-events—August Recchia, Baltimore	1,200
Men's team—Arrow "77," Baltimore	1,900
Women's singles—Betty Mooney, Baltimore	391
Women's doubles—Lora Farmer and Helen Lawrence, Richmond, Va.	757
Women's all-events—Betty Mooney, Baltimore	1,137
Women's team—New Essex, Baltimore	1,737
Mixed doubles—Pearl Heim and George Young, Baltimore.	809

James Dietsch of Baltimore, Md., placed first among the men while Mrs. Elizabeth Barger of Baltimore, Md., led the women's list for the ninth time in the last ten years. (T. V. H.)

Bowls: see LAWN BOWLING.

Boxing. Boxing in the United States continued on a steady keel during 1956, despite widespread investigations, notably in New York, Pennsylvania and California; the retirement, as undefeated world heavyweight champion, of Rocky Marciano; and the fact that for the first time in a number of years no big summer outdoor shows were held in New York city, once the stronghold of boxing.

World Championship Matches.—With the voluntary relinquishing of the heavyweight crown by Rocky Marciano on April 27, 1956, an elimination series was held to determine his successor. Floyd Patterson and Archie Moore, world light heavyweight champion, were the finalists, a bout between them, however, being held off because of an injured hand suffered by Patterson in his winning fight against Tommy (Hurricane) Jackson. The match was finally held at Chicago, Ill., on Nov. 30, and Floyd Patterson knocked out Archie Moore in the fifth round to become the new heavyweight champion of the world.

Archie Moore successfully defended his 175-lb. title by stopping Yolande Pompey of the British West Indies in the tenth round at the Harringay arena, London, Eng., on June 5. Moore later (July 25) knocked out James J. Parker, Canadian heavyweight champion, in a bout in Toronto, Ont., which was advertised as for the world heavyweight championship but which was merely another elimination contest.

Ray Robinson defended his world middleweight title once,

"SUGAR" RAY ROBINSON (right) dodging a blow by "Bobo" Olson in their middleweight championship fight at Los Angeles, Calif., May 18, 1956. A few seconds after this picture was made Robinson knocked out Olson to regain the title

knocking out Carl (Bobo) Olson in the fourth round on May 18 at Wrigley field, Los Angeles, Calif. A crowd of more than 20,000 paid \$228,500 to view the fight.

Johnny Saxton regained the world welterweight title he had lost the year previously by outpointing Carmen Basilio over 15 rounds at Chicago stadium, Chicago, Ill., on March 14. The fight grossed \$104,288. In a return bout, on Sept. 12, at War Memorial stadium, Syracuse, N.Y., Basilio rewon the welterweight title by knocking out Saxton in the ninth round.

Joe Brown won the world lightweight championship by gaining a split 15-round decision over Wallace (Bud) Smith, the titleholder, at New Orleans, La., on Aug. 24.

Sandy Saddler retained his world featherweight title by a technical knockout of Gabriel (Flash) Elorde of the Philippines in the 13th round on Jan. 18 at the Cow Palace, San Francisco, Calif. Saddler was later injured in an automobile accident which kept him inactive for a short while.

Mario d'Agata of Italy, a deaf-mute, won the world bantamweight championship by stopping Robert Cohen at the end of the sixth round on June 29 at the Foro Italico, Rome, It. D'Agata was the first deaf-mute ever to win a world boxing championship.

Pascual Perez of Argentina, the world flyweight champion, defended his title three times, winning a 15-round decision from Leo Espinosa of the Philippines at Buenos Aires, Arg. (Jan. 11), winning over Oscar Suarez of Cuba by a technical knockout in 11 rounds at Montevideo, Urug. (June 30), and stopping Ricardo Valdez in five rounds at Tandil, Arg. (Aug. 3).

Boxing Hall of Fame.—Seven new members were elected to the Boxing Hall of Fame in 1956. The Hall of Fame was inaugurated in 1954 by the *Ring* magazine and is housed in the *Ring* museum in Madison Square Garden. The board of directors voted in one pioneer of the game, Peter Jackson. The Old Timers' committee elected two, George Dixon and Jem Driscoll. The modern group named four, Tony Canzoneri, Barney Ross, Tommy Loughran and Jimmy McLarnin.

The following is a complete list of those who had been elected to the Hall of Fame:

Pioneer Group.—James Figg, Tom Cribb, Jem Mace, Tom Sayers, Gentleman John Jackson, Arthur Chambers, John C. Heenan, William Richmond, Nonpareil Jack Dempsey, Jack Broughton, Daniel Mendoza, Tom Hyer, Young Griffo, John Morrissey, John L. Sullivan, Jack McAuliffe, William Thompson (Bendigo) and Peter Jackson.

Old Timers' Group.—Stanley Ketchel, Jack Johnson, James J. Corbett, Terry McGovern, Abe Attell, George Dixon, Joe Gans, Bob Fitzsimmons,

James J. Jeffries, Sam Langford, Joe Walcott and Jem Driscoll.
Modern Group.—Jack Dempsey, Henry Armstrong, Harry Greb, Joe Louis, Mickey Walker, Gene Tunney, Benny Leonard, Tony Canzoneri, Jimmy McLarnin, Barney Ross and Tommy Loughran.

Amateur Boxing.—With 1956 an Olympic year, much stress was placed on the amateur boxing tournaments, many of the individual winners gaining berths on the United States team which fought for world honours in Melbourne, Austr., in November. (See OLYMPIC GAMES.) In the 69th annual national Amateur Athletic union championships, held in Boston, Mass., in April, individual champions were: 112-lb., Albert Pell, New York city; 119-lb., Don Whaley, Cincinnati, O.; 125-lb., Harry Smith, New York city; 132-lb., Bill Cherry, Cleveland, O.; 139-lb., Tommy Thomas, Portland, Ore.; 147-lb., Jackson Brown, Chicago, Ill.; 156-lb., Frank Davis, Ft. Wayne, Ind.; 165-lb., Paul Wright, Flint, Mich.; 178-lb., John Horne, Omaha, Neb.; heavyweight, Jim McCarter, Seattle, Wash.

In the 19th annual National Collegiate Athletic association championships, held at Madison, Wis., in April, individual champions were: 112-lb., Dean Plemmons, University of Wisconsin; 119-lb., Choken (Mike) Maekawa, Michigan State university; 125-lb., Bobby Soileau, Louisiana State university; 132-lb., Richard Rall, Washington State college; 139-lb., Dick Bartman, Wisconsin; 147-lb., Gil McLane, Louisiana State; 156-lb., Vince Ferguson, Wisconsin; 165-lb., Roger Rouse, Idaho State college; 178-lb., Orville Pitts, Wisconsin; heavyweight, Truman Sturdevant, Wisconsin. The University of Wisconsin won its eighth N.C.A.A. title, rolling up an unprecedented 47 points.

In the 29th annual intercity (East v. West) Golden Gloves championships, held at Madison Square Garden on March 21, the New York (East) team won, 6-2. Individual champions were: 112-lb., Peter Melendez (Chicago) defeated Jose Rigores (New York); 118-lb., Albert Pell (New York) defeated Vince Doniero (Chicago); 126-lb., Vincent Breen (New York) defeated Ken Morris (Chicago); 135-lb., Joe Shaw (Chicago) defeated Thomas Schafer (New York); 147-lb., Richard Hall (New York) defeated Leon Brooks (Chicago); 160-lb., Juan Pomare (New York) defeated Willis Anderson (Chicago); 175-lb., Alonzo Johnson (New York) defeated Ernie Terrell (Chicago); heavyweight, John Harper (New York) defeated Booker Staton (Chicago). (N. FL.)

Great Britain.—During 1956 two British world championship prospects, welterweight Peter Waterman and light-heavyweight Yolande Pompey, had their hopes dimmed when they were defeated by U.S. boxers Kid Gavilan and Archie Moore, respectively.

In 1956 the Frenchman Robert Cohen lost his world bantamweight championship to the Italian deaf-mute Mario D'Agata. At the invitation of the Italian boxing authorities this bout was refereed by E. J. Waltham, secretary of the British Boxing Board of Control.

During the year the British heavyweight champion Don Cockell followed Rocky Marciano's example and retired from boxing. The vacant title was won by Cardiff boxer Joe Erskine in August, when he outpointed his fellow Welshman Johnny Williams. Unfortunately Erskine suffered badly cut eyes, which seemed likely to prevent him from boxing again for some time. Eye trouble also caused the retirement from the game of British light-heavyweight champion Ron Barton. A spate of cut eyes had plagued British boxing of late and Wally Thom, who lost his British welterweight title to Peter Waterman, announced his retirement mainly on this account.

Protracted negotiations for Dai Dower to meet Pascual Perez, the Argentinian, for the latter's world flyweight title were unsuccessful.

(W. B. DV.)

Boy Scouts: see SOCIETIES AND ASSOCIATIONS, U.S.

Brattain, Walter Houser (1902-), U.S. physicist, shared the 1956 Nobel physics prize with William B. Shockley and John Bardeen (*qq.v.*) for perfecting the transistor—a tiny, sturdy and efficient substitute for the vacuum tube in electronic devices. Brattain and Bardeen jointly invented the point-contact type of transistor, with Shockley as the directing theorist and team captain, in the Bell Telephone laboratories at Murray Hill, N.J.

Born on Feb. 10, 1902, at Amoy, China, where his father was a teacher, Brattain took his bachelor's degree at Whitman college, Walla Walla, Wash., in 1924; his master's degree at the University of Oregon in 1926 and his doctorate at the University of Minnesota in 1929. After a year (1928-29) with the U.S. bureau of standards in Washington, D.C., he joined the staff of the Bell Telephone laboratories in 1929 as a research physicist. During World War II he was engaged in secret weapons research at Columbia university. He was awarded the Franklin institute's Stuart Ballantine medal in 1952.

During the years following invention of the transistor in 1948 the device found numerous uses in such applications as radio and television receivers, high-speed computers, telephone amplifiers, electronic switchers, data transmitters and automatic control devices. It is a semiconductor about the size of a shoelace tip made of such materials as silicon, germanium and certain metallic oxides. They conduct electricity by means of free electrons passed on from one atom to the next.

Brazil. A federal republic in eastern and central South America, with an area of 3,287,195 sq.mi., Brazil is second in size only to Canada in the western hemisphere. Language: Portuguese. Religion: predominantly Roman Catholic with about 1,500,000 Protestants of various denominations (mostly Methodists, Presbyterians and Baptists), and about 500,000 Spiritualists. Chief cities: Rio de Janeiro, the federal capital (1955 est. pop.), 2,725,274; São Paulo (1953 est. pop.), 2,500,000; Recife, 560,000; Salvador, 460,000; Porto Alegre, 440,000; Belo Horizonte, 430,000; Fortaleza, 300,000; Belém, 275,000.

The total population of the country, which at the time of the 1950 census numbered 51,976,357, was estimated at 60,080,341 in 1956, mostly concentrated along the coast.

The president in 1956 was Nereu Ramos (until Jan. 31); then Juscelino Kubitschek de Oliveira.

History.—At the time of his inauguration, President Kubitschek was confronted with the pressing problems of how to reduce the government's heavy indebtedness, fight inflation, increase the national productivity and, at the same time, conciliate his political antagonists. In his first message to congress, he called attention to the country's financial and economic difficulties, pointing out as its causes: the slowing down of the country's economic growth; lower prices for Brazil's export products, principally coffee, cocoa, and cotton; inflation; and budgetary deficits.

As the year started the cruzeiro, the national unit of currency, continued steadily to decline in purchasing power as well as in terms of foreign currencies. The decline of its value in terms of foreign currencies was attributed mainly to the falling off of the value of exports and to the growing need of the government to acquire large amounts of dollars and other foreign currencies for foreign debt service and to pay for essential imports. Internally, the cruzeiro declined in value as a result of the government's continuing inability to balance its budget, the consequent recourse to paper money issues, the increase in prices for all commodities, and further increase in the minimum salaries as established by law.

Despite its intention to reduce government expenditures, the administration could not withstand the pressure for an increase

Area and Population of States and Territories of Brazil

(Estimates published by the Instituto Brasileiro de Geografia e Estatística, in its Boletim Estatístico, No. 54 April-June 1956)

*Former Guaporé territory. Name changed by act of congress.

†Excludes 950 sq.mi. between Piauí and Ceará not yet delimited.

‡Area in dispute between the states of Minas Gerais and Espírito Santo.

of salaries. First the armed forces, and immediately after that the federal civil workers, received salary increases which resulted in an estimated rise of Cr\$ 20,000,000.000 a year in government expenditures. This was followed in July by a presidential decree increasing the officially established minimum salary for all workers throughout the country, adding a total estimated Cr\$ 45,000,000.000 a year to private expenditures.

Despite the critical financial situation the country continued to grow. The German Mercedes-Benz company inaugurated a truck-manufacturing plant in Santo André, near the city of São Paulo, and Willys-Overland, a U.S. company, put a new stock issue on sale as part of a program to increase capitalization and build a jeep-engine plant in Brazil. A Brazilian company (Vemag) was building a plant to make DKW station wagons under German patents. General Motors, Ford, Chrysler, American Motors and the German Magyrus and Volkswagen were said to be planning increases in their production in the country which would total 68% by 1960. A large chemical industry was to be established under the name of Petroquímica. Japanese interests were looking into the planned organization of several steel companies in the states of Minas Gerais, Espírito Santo and Santa Catarina. Volta Redonda, the government-controlled steel plant, decided to increase its production, for which it received an additional loan of U.S. \$30,000,000 from the Export-Import Bank of Washington. In August the Export-Import bank also announced a loan of U.S. \$150,000,000 to Brazil to be applied to the purchase of railroad equipment, the dredging and rebuilding of ports, and the production of electric power. Other possible loans were to follow for highways, food storage facilities, fertilizer production, irrigation and power.

Following his inauguration, President Kubitschek immediately set himself to carry out his announced program of increasing the country's electric power resources, improving transportation facilities and promoting food production. The president declared that it was his intention to increase oil production from 5,000 bbl. to 90,000 bbl. a day by 1960; to increase the refining of oil from 95,000 bbl. to 175,000 bbl.; and to improve internal transportation facilities.

He intended, he said, to reorganize the government-controlled Eletrobrás holding corporation to increase the production of electric power. The transportation facilities would be developed

by the creation of a national corporation which would be given control over all national railroads and would build 1,000 additional miles of lines. He promised to build 7,000 mi. of new automobile roads and to pave 3,000 mi. of existing dirt roads.

The president announced that food production and availability would be assisted by the construction of a chain of silos and warehouses; that wheat production would be increased to at least 1,500,000 tons a year; and that a chain of packing plants would be built with a total daily capacity of 2,800 steers and 2,200 hogs.

The administration's plans were, however, considerably delayed and curtailed by a determined opposition in congress and by the difficulty in obtaining foreign capital or loans.

President Kubitschek endeavored, apparently with little success, to conciliate his political opponents by pursuing a moderate policy toward them. Agitation continued in congress and in the press for a constitutional amendment providing for the election of the president and vice president by an absolute majority of the popular vote, and for a reform of the electoral laws to restrict voting qualifications.

President Kubitschek attended the Panama conference of July. To an invitation from Argentina to participate in a South Atlantic conference to discuss the formation of a South Atlantic defense organization, Brazil replied that it would accept providing that the Reciprocal Assistance treaty of 1947 would continue to be implemented.

On Sept. 6 President Kubitschek cancelled the 1955 United States-Brazil agreement to co-operate in exploring in Brazil for deposits of radioactive minerals. This decision apparently was taken by recommendation of the National Security council under the influence of extreme nationalist elements. Still in effect, however, was the Atoms for Peace agreement under which the United States promised to provide Brazil with 13.2 lb. of uranium reactor fuel and to donate U.S. \$350,000 toward the cost of a research reactor.

On Sept. 19 the congress adopted legislation providing for the transfer of the federal capital to the interior state of Goiás. A committee was to be appointed to formulate detailed plans for the new capital. A government-controlled corporation was to be organized to buy and sell land in the new federal district and to be in charge of the actual construction work. The new capital was to be built in a previously-selected area near Planaltina, in the highlands of southern Goiás. It was the announced intention of President Kubitschek to move the capital to Goiás before 1961. The new capital was to be called Brasília.

(See also FOREIGN INVESTMENTS.)

(R. D'E.)

Education.—In 1952 there were 84,254 elementary school units with 5,651,564 pupils, (1954) 2,485 secondary schools with 535,775 pupils, 795 commercial schools with 97,531 pupils, 598 superior schools with 64,645 pupils and 796 normal schools with 59,521 pupils. There were 11 universities, of which 3 were private (Catholic), 7 state and 1 federal (University of Brazil at Rio de Janeiro). According to the 1950 census, 51.4% of those 10 yr. of age and over were illiterate.

Finance.—The monetary unit is the cruzeiro (Cr\$), valued at 5.31 cents U.S. currency, official rate, during 1956, and at 1.32 cents, free rate, on July 30, 1956. After Oct. 16, 1953, the official rate was used only for government imports and exports of a few essentials. An auction system was used for the sale of foreign exchange for most private imports. Under this system exchange was allotted to five auction categories according to the essentiality of the goods to be imported, and the rates paid at the auctions had to be added to the official selling rate, with applicable taxes, to secure the effective selling rates. The fluctuating free-market rate was used for most capital and nontrade transactions.

The 1956 budget as approved by congress called for revenue of Cr\$ 70,-960,000,000 and expenditure of Cr\$ 71,505,000,000. Actual revenue in 1955 (preliminary) was Cr\$ 55,671,000,000; expenditure, Cr\$ 63,287,000,000. The consolidated federal external debt on Dec. 31, 1955, was \$12,561,-890, U.S. \$57,717,345, 32,976,150 French paper francs and 20,372,500 gold francs; funded internal debt, Cr\$ 10,558,088,000; floating debt (excluding the debt to social security institutes), Cr\$ 34,900,000,000. Currency in circulation (Jan. 31, 1956) was Cr\$ 56,100,000,000; demand deposits, Cr\$ 122,800,000,000. The U.S. department of commerce estimated U.S. direct private investments in 1955 at \$1,107,000,000, of which \$563,000,000 represented investments in manufacturing. National income in 1954 was estimated at Cr\$ 442,500,000,000. The cost-of-living index (São Paulo) stood at 167 in March 1956 (1953=100).

Trade and Communications.—Exports in 1955 totalled U.S. \$1,423,247,-

ooo: imports, \$1,306,835,000. Leading exports were coffee (59%), raw cotton (9%), cacao (6%), pine wood (4%) and sugar (3%). Leading import groups were raw materials (32%), machinery and vehicles (29%), foodstuffs and beverages (14%) and chemicals and drugs (12%). Leading customers were the U.S. (42%), Germany (7%), Argentina (7%), the U.K. (4%) and France (4%); leading suppliers, the U.S. (24%), Argentina (12%), Germany (7%), the Netherlands Antilles (6%) and France (5%).

Railway mileage (Dec. 31, 1954) was 23,104; in 1954, an estimated 349,522,000 passengers and 37,118,000 metric tons of freight were carried. Highways and roads totalled 225,000 mi. on Dec. 31, 1954. On Dec. 31, 1955, there were 374,498 automobiles, 333,793 trucks and 26,217 buses. In 1955 Brazilian air lines flew an estimated 70,287,000 mi. and carried 2,988,724 passengers. According to *Lloyd's Register of Shipping*, the merchant marine had 396 vessels (100 tons and over) aggregating 892,823 gross tons on June 30, 1955. Telephones (Jan. 1, 1955) totalled 745,617, of which 82.6% were automatic.

Agriculture.—Coffee production in the 1955-56 season (preliminary figures) totalled 23,500,000 bags of 132 lb. each; exports in 1955 were 13,696,000 bags, of which 7,831,000 bags went to the U.S. and 687,000 bags to Germany. Preliminary official estimates for other crops in 1955 (in metric tons) included cotton (ginned) 406,000, cacao 162,000, wheat 983,000, maize 6,906,000, rice (rough) 3,920,000, cassava 14,535,000, potatoes 864,000, bananas 213,000,000 (stems), sugar 2,073,000, sisal 98,000, leaf tobacco 141,000, peanuts 219,000, cottonseed 766,000.

Livestock estimates (Dec. 31, 1954) showed 61,442,000 cattle, 7,286,000 horses, 35,555,000 pigs, 17,503,000 sheep and 9,481,000 goats. Forest exports in 1955 included pine wood 673,000 metric tons and carnauba wax 12,000 tons. Rubber production was about 21,500 tons.

Manufactures.—The 1950 census of industry listed 89,086 industrial establishments with 1,256,807 workers and production (1949) valued at Cr\$ 116,747,264,000, of which the food-processing industry accounted for 29%, textile 17%, chemical and drug 8% and metallurgical 7%. Preliminary production figures for 1955 included cement 2,693,000 metric tons, pig iron 1,037,000 tons, raw steel 1,132,000 tons, iron and steel sheets 1,009,000 tons. Installed electric energy capacity totalled 2,805,527 kw. on Dec. 31, 1954; production in 1954 was 10,589,807,000 kw.hr.

Minerals.—Preliminary production estimates for 1955 included coal 2,256,000 metric tons, gold 111,500 fine oz., iron ore (metal content 65%) 3,600,000 tons (exports 2,565,000 tons), manganese ore 380,000 tons (exports 177,000 tons), crude petroleum 254,000 tons (about 1,885,000 bbl.). Imports in 1955 included coal 563,562 tons, crude petroleum 3,513,056 tons, gasoline 1,070,295 tons, fuel and diesel oil 3,255,675 tons.

(J. W. Mw.)

ENCYCLOPEDIA BRITANNICA FILMS.—*Brazil* (People of the Plantations) (1940).

Bread and Bakery Products: see BAKING INDUSTRY.

Brennan, William Joseph, Jr. (1906–), U.S. jurist, was appointed associate justice of the U.S. supreme court in 1956 by Pres. Dwight D. Eisenhower to succeed Sherman Minton, who had retired because of ill health. Brennan at the time of being sworn in, on Oct. 16 at Washington, D.C., was the youngest member of the supreme court. His recess appointment was subject to confirmation by the senate in 1957.

Born at Newark, N.J., on April 25, Brennan took his bachelor's degree at the University of Pennsylvania's Wharton school of finance and commerce in 1928, and his law degree from Harvard in 1931. Admitted to the New Jersey bar in 1931, he practised law at Newark until 1949, when he was named judge of the New Jersey superior court. The next year he was appointed appellate division judge and in 1952 he was elevated to the state supreme court bench. During World War II he was a legal officer with the army's general staff, attaining the rank of colonel.

Brennan, who was President Eisenhower's third appointment to the nation's highest court, was reportedly chosen after a national poll of bar association officers and state judges by the White House. A Democrat, who had not been actively engaged in politics, and a Roman Catholic, the new justice was known for his championship of civil rights. His appointment kept the existing political balance of the supreme court at six Democrats and three Republicans.

Brewing and Beer. **Sale and Consumption.**—Beer and ale sales in the United States for the fiscal year ended June 30, 1956, totalled 85,537,000 bbl. (of 31 U.S. gal. each), the fourth highest year on record. The largest sales total was 86,992,000 bbl. in fiscal 1948.

Market trends followed the pattern of recent years, packaged beer sales achieving the highest ratio on record—78.4%. Of packaged beer sales during the 1955 calendar year, 60.6% was in

returnable bottles, 5.3% in nonreturnable (no deposit) bottles and 34.1% in cans—a new high.

Although the United States, with 90,697,000 bbl., led the world in beer and ale production, it was tied with the German Federal Republic for seventh place in per capita consumption (15.9 gal.). Belgium, with 37 gal. per person, retained its customarily wide lead, followed in order by Luxembourg, Australia, New Zealand, United Kingdom and Denmark.

As in previous years, the rate of state taxes was believed by market analysts to have influenced beer consumption in many areas of the United States. Industry prospects, at mid-1955, had looked bright for a record year, but new tax increases in several southern states apparently applied a brake to mounting sales. Wisconsin, followed by Nevada and Michigan, each with a comparatively low state tax, led the states in per capita consumption. North Carolina, Mississippi and Alabama, each with a relatively high state tax, had the lowest per capita consumption.

Taxes.—For the third consecutive year, beer was a \$1,000,000,000-a-year producer of public revenue in 1955, through payment of \$756,078,000 in federal revenue, \$216,128,000 in state revenue and an undetermined amount in local taxes.

Wages.—The census of manufactures report showed for the brewing industry a payroll of \$414,000,000 for 1954, the latest year for which figures were available in 1956. The 1956 edition of the *Brewers Almanac*, published by the United States Brewers foundation, disclosed that the average weekly earnings for brewery production workers was \$97.84, a new high, as compared with \$72.10 for all food industries and \$76.52 for all manufacturing. This represented a six-year rise of \$25.18 per week as compared with \$17.19 for all manufacturing.

Safety.—The industry-wide safety campaign, given impetus through the United States Brewers foundation-sponsored annual contest, was an important factor in reducing the industry's accident frequency to 16.8 per 1,000,000 man-hours during 1955, a reduction of 52.7% from the 35.5 per 1,000,000 man-hours in 1948, when the program was launched.

Research.—Continuous research on the art and science of brewing, the value of beer as a beverage and its contribution to human welfare was carried out in various colleges under the sponsorship of Brewing Industries Research institute. (See also LIQUORS, ALCOHOLIC.) (E. V. Lh.)

Bridge, Contract: see CONTRACT BRIDGE.

Bridges. The world's longest spans of the various types built up to 1956 are listed in the table. There was no change in the table during 1955 and 1956.

United States.—The upper deck' of the \$68,000,000 Richmond-San Rafael bridge across San Francisco bay was completed in 1956. Completion of the lower deck was scheduled for 1957. The bridge is 4 mi. long and includes thirty-six 100-ft. girder spans, thirty-six 289-ft. truss spans and two cantilever bridges. Each cantilever bridge has a 1,070-ft. centre span and two 535-ft. anchor arms.

The Tappan Zee bridge over the Hudson river between Nyack and Tarrytown, on the New York state thruway, was opened to traffic late in 1955. Total length of the bridge is 16,000 ft. The main unit is of through cantilever type with a centre span of 1,212 ft. flanked by 602-ft. anchor arms. The approaches include 20 steel deck trusses 235 to 250 ft. long with the remainder made up of 50-ft. beam spans. The over-all width of the bridge is 90 ft. between railings. This bridge has a unique engineering feature in the use of eight concrete piers of a buoyant type to reduce the dead load on the main foundations by 80%. The cost of the bridge was \$60,000,000.

After 63 years of service, the swing bridge that carried the

World's Longest Spans by Type of Bridge

*Railroad bridge.

†Not standing.

New York Central railroad over the Harlem river in New York city was replaced in 1956 by a vertical lift bridge. The new structure is 1,780 ft. between abutments with through type plate girder approaches and two 380-ft. duplicate, parallel, double-track, through type, Warren truss vertical lift spans, with an underclearance of 135 ft. when raised.

An expressway between the Holland tunnel and the New Jersey turnpike was completed in 1956. It includes a \$20,000,000 bridge across Newark bay which carries two 36-ft. roadways. With approaches, the bridge is 9,500 ft. long between abutments. An arch-type channel span is 400 ft. long.

The longest bridge in the world, a 24-mi. low-level structure over Lake Pontchartrain, between Mandeville and New Orleans, La., was completed in 1956. It carries a 28-ft. roadway on 2,235 precast, prestressed, concrete spans 56 ft. long. Each pier consists of two prestressed 54-in. hollow concrete piles, topped by a precast concrete girder. Eleven special spans provide three bascule bridges. The bridge cost \$46,000,000.

The Queensboro bridge over the East river in New York city, one of the most heavily traveled bridges in the world, was provided with two additional traffic lanes to add to the existing seven lanes. Space for the new roadway was provided by the

removal of rapid transit tracks from the upper deck. Originally designed to carry four trolley tracks on the lower deck and four rapid transit tracks on the upper deck, the bridge now would carry only vehicular traffic.

Construction was started late in 1955 on the rebuilding of the International bridge over the Rio Grande at Laredo, Tex., which had been partially destroyed by flood in 1954. The previous structure consisted of two approach spans and five concrete arch spans. The new structure would have prestressed concrete girders and would use the original piers which were unharmed. It would carry a 40-ft. roadway and two 8-ft. sidewalks.

Scheduled for completion late in 1956, the Kingston-Rhinecliff bridge over the Hudson river in New York is of continuous deck type with two 800-ft. main spans, with arched bottom chords. It carries a 36-ft. roadway and two 2-ft. emergency sidewalks.

A two-span, through, steel arch bridge was completed in 1955 over the Missouri river at Leavenworth, Kan. The arch ribs are slender and are stiffened by deep tie-girders that are continuous over the two 420-ft. arch spans. Vierendeel bracing is used between the arch ribs. The approaches consist of continuous deck girder spans with a distance of 2,436 ft. between abutments. The bridge carries a 26-ft. roadway and two 2½-ft. sidewalks. The cost of the bridge was \$2,700,000.

The Pennsylvania and New Jersey turnpikes were connected in 1956 by a bridge over the Delaware river, costing \$16,000,000, between Edgely, Pa., and Florence, N.J. Its 76-ft.-6-in. roadway carries six lanes of traffic. The main crossing is a three-span continuous truss bridge with a tied-arch 682-ft. centre span, flanked by 341-ft. side spans. The over-all length of the bridge is 6,571 ft.

Construction was completed late in 1955 of a \$3,500,000 double-leaf bascule bridge over the Chehalis river at Aberdeen, Wash. Each leaf is 135 ft. long between pivot and midspan, making the bridge one of the longest of its type in the west.

A three-span continuous bridge was completed over the Missouri river at Jefferson City, Mo., late in 1955. The centre span

SIDNEY LANIER BRIDGE, near Brunswick, Ga., completed in June 1956. The mile-long bridge crosses Oglethorpe bay, about 5 mi. west of the Atlantic ocean

is a 640-ft. tied arch with side spans of 416 ft. Continuous deck girder approach spans make up the total length of 3,093 ft. The bridge carries a 28-ft. roadway and two 4-ft.-10-in. sidewalks and cost about \$4,800,000.

The Gateway bridge, of suspension type, across the Mississippi river at Clinton, Ia., was completed in 1956. Its cost was \$6,800,000. The bridge is 9,557 ft. long with a main span of 644 ft. It carries a 26-ft. roadway and two 3-ft. sidewalks.

Bids were taken late in 1955 for the construction of a \$46,000,-000 bridge to parallel the existing Carquinez Straits bridge in California. The bridge would be of cantilever type with two 1,100-ft. main spans, two 500-ft. side spans and a 150-ft. tower span between the two main spans. The new bridge would be a copy of the older bridge in elevation, but would be 60 ft. wide instead of 42 ft.

A cantilever bridge was completed late in 1955 over the Columbia river at Umatilla, Ore. It has two 600-ft. main spans, joined by a 120-ft. tower span, and flanked by two 300-ft. anchor arms. The approaches consist of 15 plate girder spans.

Construction was started in 1955 on a \$6,500,000 bascule bridge across the Duwamish river in Seattle, Wash. The bridge features two buoyant-type main piers to reduce the pressure on the foundations. The two main piers would be connected below channel bottom by two cellular concrete struts to maintain their alignment and spacing even in the event of an earthquake.

A continuous through truss bridge was completed late in 1955 across the St. Lawrence river at Massena, N.Y., to Barnhart Island, at a cost of \$5,000,000. Carrying two lanes of vehicular traffic and one railroad track, the bridge was the first completed permanent structure in the St. Lawrence power project. The centre span is 508 ft., flanked by 283-ft. end spans.

Work was started in 1956 on an \$8,000,000 high-level cantilever bridge over the ship channel at Corpus Christi, Tex. The main span was to be 620 ft. and the anchor arms 312 ft. The approaches would include deck truss spans, welded plate girder spans and prestressed concrete spans. The bridge would carry two 36-ft. roadways, separated by a 4-ft. mall, and two 3-ft. sidewalks. The length between abutments would be 5,818 ft.

Construction was started in 1956 on a three-span plate girder bridge over the Quinnipiac river at New Haven, Conn. Its 387-ft. centre span would make the bridge the longest of its type in the United States. One of the connecting approaches includes a girder span of 379 ft., the second longest in the U.S.

Plans were made in 1956 for an \$18,000,000 floating concrete bridge across Lake Washington, east of Seattle, similar in design to the floating bridge that had been in use since 1940, except for a modification to eliminate curves in the roadway around the draw span. A new crossing over San Francisco bay, consisting of fill, trestle and tube at an estimated cost of \$250,000,000, was studied in 1956 and declared to be feasible.

A new world's record for long-span glued-laminated timber arches was set on a recently completed arena at West Palm Beach, Fla. The arches are three-hinged with a clear span of 242½ ft. and a rise of 74 ft.

Dominican Republic.—A \$5,000,000 suspension bridge was completed in 1956 over the Ozama river in Ciudad Trujillo. It has a main span of 576 ft. and carries a 48-ft. roadway. The approaches are made up of five 102-ft. deck truss spans.

England.—Construction was started in 1956 on a steel arch highway bridge over the Mersey river near Liverpool. The span would be 1,062 ft. and would carry a 33-ft. roadway and one 6-ft. sidewalk. It would be the longest bridge of its type in Great Britain, and would cost \$5,600,000.

Germany.—A novel suspension bridge was planned in 1956 for erection over the Rhine river at Cologne. It was to have a single tower in the river of triangular shape with a series of

straight stays radiating from the apex out to the midpoints of the adjacent 990- and 500-ft. spans, to carry a 75-ft. wide deck.

Gold Coast.—Scheduled for completion late in 1956, an 805-ft. steel arch bridge was being constructed across the Volta river at Adomi. The steel was fabricated in Great Britain and welded into 5-ton arch segments before shipment. The cost would be \$2,000,000.

Italy.—A four-conductor power line was completed across the Straits of Messina late in 1955 with a record-breaking span between towers of 12,000 ft. The towers are 735 ft. high. A concrete arch bridge completed in 1956 over the Arzocco river at Varazze is unique in the use of centring of wood trussed arches with 331-ft. clear span and 98-ft. rise. The chords of the wood arch centring were made up of bundles of planks, bent to shape, and clamped with bolts.

Japan.—The Inoura Narrows bridge, at the mouth of Omura bay, Kyushu Island, a fixed truss arch of 710-ft. clear span, was completed late in 1955. It was the third longest fixed steel arch and the longest fixed steel truss arch in the world and carries a 24-ft. roadway. The trusses are cradled for stability against wind.

New Zealand.—A prestressed concrete bridge, consisting of five 105-ft. spans, was completed over the Hutt estuary near Wellington. The largest bridge of its type in that country, it carries a 30-ft. roadway, a 6-ft. sidewalk and an 11-ft.-6-in. serviceway for water mains.

Portugal.—Construction was scheduled to start in 1956 on a \$3,000,000 bridge over the Douro river between Porto and Gaia. The bridge was to be a single 886-ft. reinforced concrete span which would be the longest of its type in the world.

Sweden.—A self-anchored suspension bridge of unusual design was completed in late 1955 over the Stromsund in central Sweden with a main span of 600 ft. and side spans of 245 ft. to carry a 30-ft. roadway. In place of the usual cable and suspender arrangement, this bridge has inclined stays from the tops of the towers to the stiffening girders. There are four stays in the main span, two from each tower, fastened to the stiffening girder at the fifth points. There are two stays in each side span, fastened to the end and midpoint of the stiffening girder.

A single-leaf bascule, completed in 1956 in Stockholm, has the largest area for a bridge of its type in the world. Its span is 138.5 ft. and width 73 ft. Provisions were made to widen the bridge at a later date to 89 ft.

Venezuela.—A \$45,000,000 bridge and tunnel project was planned in 1956 to cross Lake Maracaibo strait between Maracaibo and Palmarejo to carry a highway and railroad. The tunnel would carry the highway under the ship channel and a lift bridge would carry the railroad over the ship channel. (See also ROADS AND HIGHWAYS.)

(D. B. S.)

British Borneo. Under this heading are grouped the colonies of North Borneo (including Labuan Island) and Sarawak, and the protected sultanate of Brunei. Languages: various indigenous, Chinese, Malay (lingua franca). Religions: Moslem, Buddhist, various pagan, many Chinese Christians.

North Borneo.—Area: 29,388 sq.mi. (including Labuan 35 sq.mi.). Pop.: (1951 census) 334,141, including 243,009 Borneans, 74,374 Chinese; (1954 est.) 367,753. Chief towns (pop. 1951 census): Jesselton (cap.) 11,704; Sandakan (port) 14,499. Governor in 1956, R. E. Turnbull.

Sarawak.—Area: 47,071 sq.mi. Pop.: (1947 census) 546,385; (1954 est.) 605,000, including 213,200 Sea Dayaks (Ibans), 47,500 Land Dayaks, 32,300 other indigenous tribespeople, 167,700 Chinese, 137,700 Malays and Melanaus. Chief towns (pop. 1954 est.): Kuching (cap.) 45,500; Sibuan (river port) 12,000;

Miri (oil fields) 10,600. Governor (and high commissioner for Brunei) in 1956, Sir Anthony Abell.

Brunei.—Area: 2,226 sq.mi. Pop.: (1947 census) 40,657; (1955 est.) 56,000 (Malay 49%, Dayak 3.5%, other indigenous 25.5%, Chinese 19%, other Asian 1.5%, European 1.5%). Chief towns (pop., 1955 est.): Brunei Town (cap.) 11,000, Seria (oil fields) 18,000. Sultan, Omar Ali Saifuddin; British resident in 1956, J. O. Gilbert.

History.—Rubber production continued at a high level in the first half of 1956 despite the decline in rubber prices, but there was a marked drop in the exports from Sarawak. Contrary to expectation, production of petroleum from the Seria field of Brunei was maintained at the level of 1955. The British Malayan Petroleum company commenced offshore drillings in both Brunei and Sarawak. Three of the drilling platforms in Brunei were 25 mi. out to sea; the Sarawak drilling, about 60 mi. S.W. of Brunei, was about 8 mi. offshore. In North Borneo new government offices and a hospital building were completed in Jesselton, and a new workmen's compensation ordinance came into force.

(D. W. F.)

Education.—(1955) Schools: *North Borneo*: primary 228, pupils 24,771; secondary 4 (and 20 schools with secondary forms), pupils 2,070; 1 vocational and 1 teachers' training school. *Brunei*: primary Malay vernacular 44, pupils 8,300, teachers 300; Chinese 8, pupils 1,727; mission 3; secondary, pupils 332, teachers 26; teachers' training, pupils 96. *Sarawak*: primary 567, pupils 47,543; secondary 34, pupils 5,245 (37,277 of total enrolment were Chinese).

Finance and Trade.—Monetary unit: Malayan dollar, M\$3.1=U.S.\$1.

Budget	Revenue	Expenditure
North Borneo (1954 actual)	M\$ 23,796,347	M\$ 26,892,589
Brunei (1955)	M\$102,669,000	M\$ 28,934,000
Sarawak (1955)	M\$ 49,774,861	M\$ 34,431,606

Foreign trade	Imports	Exports
North Borneo (1955)	£10,220,000	£12,240,000
Brunei (1955)	£12,210,000	£35,400,000
Sarawak (1955)	£51,600,000	£55,700,000

Principal exports (1954; 1953 in parentheses): *North Borneo*: rubber 16,800 tons (17,100 tons), copra 26,600 tons (12,700 tons), tobacco 311,300 (142,900) lb., timber 10,500 (5,200) cu.ft. *Sarawak*: crude oil, refined oil, pepper 15,465 tons, rubber 23,188 tons, timber 197,376 tons. *Brunei*: crude oil (production) 38,750,000 bbl., natural gas, plantation gas. Principal imports: machinery, textiles, tobacco, cereals.

British Columbia. The third largest and the most westerly of Canada's ten provinces, British Columbia has an area of 366,255 sq.mi. of which 6,976 sq.mi. is water. It is bounded on the west by the Pacific ocean and the Alaskan panhandle; east by the province of Alberta; south by the 49th parallel and the states of Washington, Idaho and part of Montana; and north by the 60th parallel and Alaska, Yukon Territory and part of the Northwest Territories.

The population on June 1, 1956, was estimated to be 1,350,000 (1951 census 1,165,210). The 1951 census indicated there were 93,471 urban dwellers and 371,739 rural dwellers, and that 66% of the population was of British extraction. The chief cities and their 1955 estimated populations were: Vancouver, 398,227; Victoria, the capital, 53,000; and New Westminster, 36,000. The metropolitan population of Vancouver and Victoria were estimated to be 644,000 and 123,000, respectively.

History.—In the fourth session of the 24th parliament of British Columbia, Jan. 17 to March 2, 1956, the following measures were among those passed: an act to provide for two weeks' annual holidays for workers; an act to aid areas distressed through loss of crops or livestock as a result of drought, flood or frost; an act to prevent discrimination in regard to employment and in regard to membership in trade unions by reason of race, religion, colour, nationality, ancestry or place of origin; an act respecting the milk industry, so that producers would receive adequate returns and consumers be ensured continuity of safe, clean fluid milk; an act to control the pollution of waters of the province.

INDIAN CHILDREN of British Columbia meeting Gov. Gen. Vincent Massey of Canada during the latter's tour of the provinces in 1956

In January the Social Credit government announced as its program a major expansion of the agricultural department, new labour legislation, large highway developments, new mental health facilities, a cut in amusement taxes, extension of the Pacific Great Eastern railway to the Peace river and the establishment of a "capital improvement district commission" to develop the capital and surrounding districts.

On June 10 the last spike was driven home marking the completion of the Pacific Great Eastern railway's Squamish-North Vancouver extension. Also in June, the Westcoast Transmission company's gas pipeline started pushing southward to link Vancouver with the vast gas resources of the Peace river area. In September the P.G.E. railway commenced passenger and freight operations from North Vancouver to Prince George.

On Sept. 19, 1956, a provincial election was held with the following party standings, with previous standings in parenthesis: Social Credit 39 (28); Co-operative Commonwealth federation 10 (14); Liberal 2 (4); Labour 1 (1); Independent 0 (1). (The number of legislative seats now totals 52; at the time of the previous election, June 9, 1953, there were 48 legislative seats.)

Members of the provincial executive council or cabinet and their portfolios at Oct. 1, 1956, were: W. A. C. Bennett, premier, finance and president of council; W. D. Black, provincial secretary and municipal affairs; R. W. Bonner, attorney general; W. K. Kiernan, mines; W. N. Chant, public works; P. A. Gagliardi, highways; W. R. T. Chetwynd, agriculture and fisheries; L. Wicks, labour and railways; E. C. F. Martin, health and welfare; R. G. Williston, lands and forests; L. R. Peterson, education; E. C. Westwood, trade and industry.

Education.—During the school year ending June 30, 1955, 223,840 students were enrolled in the schools of the province: elementary, elementary-senior-junior high (154,016); superior (2,450); junior, junior-senior and senior high (67,374). Teaching staffs comprised 8,185 teachers as follows: in the elementary, elementary-senior-junior high, 5,105; superior, 101; junior, junior-senior and senior high, 2,915; and 64 unclassified. Higher education is provided by the University of British Columbia, Vancouver, a provincially endowed institution, with an affiliated junior college, Victoria college, located in Victoria. There are two teacher-training schools located at Victoria and Vancouver and a vocational institute at Vancouver.

The total net cost for the enrolment of 223,840 in 1954-55 was \$80,823,264. The deputy minister and superintendent of education was H. L. Campbell.

Communications.—The total highway mileage as of March 31, 1955, excluding the Alaska highway, was 22,847 mi., of which 12,093 mi. were surfaced, 9,204 mi. were improved earth and 1,550 mi. unimproved earth.

Railway mileage as of Dec. 31, 1955, was 4,495 mi. of main-line track and 1,259 mi. of sidings. During 1955 approximately 8,423,651 tons of cargo were loaded at British Columbia ports on vessels destined to foreign countries, while 1,885,991 tons of cargo received from foreign countries were unloaded at local ports. In 1954 the total number of telephones was 374,275, including 194,110 on automatic switchboards. During 1955 there were 298,396 passenger cars and 100,259 commercial vehicles registered in the province.

Finance.—On Feb. 1, 1956, W. A. C. Bennett, minister of finance, an-

nounced that revenue collected for the fiscal year ended March 31, 1955, was \$198,990,000; expenditures were \$183,437,000; the net debt at Dec. 31, 1955, was \$125,937,817, a decrease of \$13,432,325 from the preceding year. Anticipated revenues were \$224,537,019 and expenditures \$258,427,024, including capital out of income for the fiscal year ending March 31, 1957.

Table I.—*Economic Activity in British Columbia*

	Unit	1954	1955	1956 Preliminary Estimates
Agriculture				
Total value of production	\$	129,177,288	132,000,000	139,000,000
Livestock	\$	17,104,000		
Poultry products	\$	26,070,000		
Dairy products	\$	30,537,000		
Fruits and vegetables	\$	19,821,735		
Field crops	\$	29,794,000		
Miscellaneous	\$	5,850,553		
Fisheries				
Total value of products	\$	69,422,000	60,000,000	63,000,000
Pack of canned salmon	cases	1,743,406	1,406,230	1,200,000
Forestry				
Total value of production	\$	528,022,783	631,699,562	660,000,000
Timber scaled	M.B.M.	5,567,423	6,109,202	
Paper production	tons	647,117	688,873	
Mining				
Total value of production	\$	153,377,315	174,710,606	175,000,000
Lead	\$	45,482,505	45,161,245	
Zinc	\$	34,805,755	52,048,909	
Gold	\$	9,042,246	8,587,920	
Coal	\$	9,154,544	8,986,501	
Internal Trade				
Sales of life insurance	\$000	198,360	234,122	280,000,000
Total value of retail trade	\$000	1,249,000	1,379,000	1,500,000
Value of retail department store sales	\$000	173,960	189,302	210,000
Railway freight loaded	tons	11,250,000	14,194,840	14,900,000
Consumption of electric power	000 kw.hr.	5,209,683	5,895,295	6,480,000
Construction building permits	\$000	164,840	227,763	275,000
Bank debits	\$000	11,956,325	12,812,854	15,000,000
Index of employment	1949=100	106.2	110.0	115.0
Personal income	\$000	1,856,000	1,938,000	2,150,000

Agriculture, Fisheries, Mining, Forestry.—Preliminary provincial departmental estimates indicated that the primary industries in 1956, with the possible exception of agriculture, showed moderate increases in value over the figures for 1955. Exports and imports through British Columbia customs ports continued to show increases over the previous highs established during 1955. Several pulp and paper companies commenced operations during 1956, and more plants were under way or under consideration. Prices tended to increase moderately, but wages and employment also increased, and in fact labour shortages were apparent in most of the skilled trades.

Table II.—*Principal Manufacturing Industries of British Columbia*

Industry	Selling value of factory shipments	
	1953	1954
Sawmills	\$ 323,474,522	\$ 347,883,651
Pulp and paper	138,883,093	157,781,577
Petroleum products	40,562,462	81,547,626
Fish processing	65,726,800	71,068,695
Veneers and plywoods	56,503,885	56,082,562
Slaughtering and meat packing	53,415,699	54,254,450
Sash, door and planing mills	47,658,772	54,164,602
Miscellaneous food preparations	40,172,603	43,857,827
Shipbuilding	32,548,906	34,040,210
Fertilizers	35,156,537	31,108,896
Total, all manufacturing industries	\$1,366,823,690	\$1,474,156,242

Manufacturing.—The high light of British Columbia's growing economy during 1956 continued to be the expansion of secondary industries both in number and location. The northern areas of the province showed exceptional growth, and the discovery of gas and oil coupled with the completion of the P.G.E. railway from Prince George to North Vancouver assisted in this growth. The Aluminum Company of Canada at Kitimat was expanding its facilities, increasing its developed horsepower from 450,000 to 750,000. (G. T. H.)

ENCYCLOPÆDIA BRITANNICA FILMS.—*Pacific Canada* (1943).

British Commonwealth: see COMMONWEALTH OF NATIONS.

British East Africa. This term is used to include Kenya, colony and protectorate; Somaliland protectorate; Tanganyika, trust territory; Uganda, protectorate; and Zanzibar, protected island sultanate.

The East Africa high commission, comprising the governors of Kenya, Tanganyika and Uganda, administers taxation, development and research, transport and other central services in these territories, and has power to legislate, with the advice and consent of the East African central legislative assembly. Governors in 1956: Kenya, Sir Evelyn Baring; Somaliland, T. O. Pike;

Tanganyika, Sir Edward Twining; Uganda, Sir Andrew Cohen. Buganda (protected African kingdom within Uganda): kabaka (king), Mutesa II; British resident, C. A. L. Richards. Zanzibar: sultan, Sir Khalifa bin Harub; British resident, H. S. Potter. East Africa high commission: chairman, Sir Evelyn Baring; administrator, A. M. Bruce Hutt.

Territory	Area (sq.mi.)	Pop. (1955 est.)	Chief towns (with pop., latest est.)
Kenya	223,478	6,048,000	Nairobi (cap., 118,976*) Mombasa (port, 84,746*)
Somaliland	67,997	640,000	Hargeisa (cap., c. 20,000 hot season—40,000 cold season) Berbera (port, 9,080†)
Tanganyika	362,688	8,324,000	Dar es Salaam (cap., 99,140†) Tanga (22,136†)
Uganda	93,981	5,508,000	Entebbe (cap., 7,942†) Kampala (Buganda cap., 22,094*)
Zanzibar	1,020	278,000	Zanzibar (cap., 45,275*)

*1948 census. †1951 est. ‡1952 census.

History.—*Kenya.*—Conditions improved greatly during 1956. Statements made in Nairobi in January indicated that the government considered that movements among Kikuyu, Embu and Meru tribesmen to secure Mau Mau aims by methods of passive resistance modelled on the Indian passive resistance campaign had been brought under control. The aims of the movements had been to obtain more land for the Kikuyu, self-government for the three tribes and the expulsion of Europeans. On April 10 "General" Tanganyika, third in rank in the Mau Mau organization, was recaptured and subsequently tried on a charge of murder. On Oct. 21 Dedan Kimathi, over-all leader of the militant Mau Mau since the early days of the emergency, was also captured. The British secretary of state for the colonies, A. T. Lennox-Boyd, had been able to announce in parliament early in June that the effective strength of the Mau Mau was reduced to about 1,000.

The 1955–56 coffee crop reached the record figure of 23,500 tons, worth more than £11,000,000. The tea industry also had a record year in 1955, producing 19,000,000 lb. Kenya exports in the first three months of 1956 showed an increase of almost 50% over the same period of 1955 and totalled in value £10,487,520. In February the government floated a loan of £4,250,000 for the development of agriculture, education, road communications, water supplies and airfields, but failed to attract investors. In the same month, however, E. A. Vasey, Kenya's minister for finance, was able to announce that, subject to the approval of parliament, the British government was prepared to make available up to £6,000,000 in the financial year 1956–57, consisting of a grant of £4,000,000 and an interest-free loan of £2,000,000. He added that the £10,000,000 grant made in 1955–56 was proving adequate for the needs of the current financial year and it was unnecessary to draw upon the additional £4,000,000 interest-free loan offered by the United Kingdom. By September, however, the financial situation appeared less satisfactory and Vasey stated that many developments regarded as essential or desirable might have to be postponed or restricted.

In January the Coutts report on the method of electing African members of the Kenya legislative council was tabled in the council along with proposals published by the Kenya government. It was stated by W. F. Coutts himself (who after preparing the report became minister of education, labour and lands) that the universal complaint of the witnesses he had heard had been of the inadequacy of African representation rather than of the manner of election. The proposals included direct voting by secret ballot in all African elections, minimum age qualifications of 21 for voters and 25 for candidates together with qualifications of education or public service or experience or character. In addition, candidates would be required to have further minimum educational and salary or other qualifications. Any Kikuyu, Embu or Meru wishing to vote would be required to satisfy his district

VEILED AFRICAN WOMEN watching Princess Margaret Rose of Great Britain in a procession through the streets of Mombasa, Kenya, during her tour of the East African colonies in 1956

commissioner that he had given active support to the crown during the emergency. Members of the three tribes would neither be permitted to stand for election outside Central province or Nairobi nor to vote for candidates outside those areas. African members of the legislative council welcomed the recommendations in general but disliked the proposed multiple voting. In April the European Elected Members association submitted to the governor proposals for changes in the Kenya constitution while three months later, in July, the African unofficial members of the legislative council condemned the spate of constitutional proposals that had been published. Shortly afterward six Asian elected members claimed that negotiations to bring about constitutional changes were frustrated because the European elected members insisted on the maintenance of parity with non-European representation even if the African membership of the council was increased. The election of European and Asian members of the legislative council took place in September and October. In the latter month the 14 European elected members agreed to discard all group or party affiliations. Almost simultaneously the secretary of state for the colonies announced that he had agreed to modifications in the constitution proposed by unofficial members of all races in the legislative council. As soon as the constitution had been amended two more African representatives would be appointed, together with two nominees suggested by the board of agriculture and the board of commerce and industry. The membership of the council of ministers also would be increased by one European and one African and the government agreed that extra seats should be created in the legislative council to correct the disparity between government and nongovernment representation and to allow ministers the opportunity to represent a wider section of the community than one constituency.

Under the heading of capital expenditure the most important theme to be undertaken was the laying down of new railway

marshalling yards and the provision of a new industrial area in Mombasa. Preliminary work on Kenya's long-term hydroelectric scheme at Seven Forks on the Tana river also proved satisfactory. Another great scheme began to bear fruit when the first courses for full-time students of the Royal Technical college began in April. The Gandhi Memorial academy, incorporated in the college, was opened by the vice-president of India, S. Radhakrishnan, in July and the college itself was officially opened by Princess Margaret during her visit to Kenya in October. The duke of Edinburgh also visited the colony in October. In April Indians and Moslems alike expressed disapproval of the government's statement that Britain would be regarded as the primary source of new immigrants.

Tanganyika.—The year began badly with floods from the Ruvuma river causing loss of life and considerable damage. Constitutional issues were prominent. In January the Tanganyika National society published its program in which it called for common citizenship, a single system of voting based upon mutually agreed qualifications, the abolition of racial discrimination and ultimate self-government for Tanganyika within the British commonwealth. Shortly afterward members of the legislative council representing all three races founded the United Tanganyika party with, again, full self-government within the commonwealth as an ultimate objective and an antifederation policy, with "Tanganyika for the Tanganyikans" as its slogan. The party also denounced racial discrimination. In March V. K. Krishna Menon, chief Indian delegate to the United Nations, stated in the Trusteeship council that progress in Tanganyika had stagnated during the past 20 years. Britain replied that the rate of advance was not entirely at the will of the administration. In spite of strenuous British objections against imposing too rigid a pattern the council approved a report calling upon Britain to lay down intermediate target dates toward political independence for Tanganyika. On April 25 the governor, Sir Edward Twining, announced that elections on a common roll to the legis-

lative council would take place in some constituencies in 1958, and in May he appointed a committee to study the government's detailed proposals for putting this plan into effect. The committee's proposals, submitted in July, included residential qualifications for voters and candidates and, in addition, alternative qualifications of education, public office, income and property. The year was also memorable for a visit in October by Princess Margaret.

Uganda.—The question of direct elections occupied attention in Uganda throughout the year. In January a motion calling for direct elections to the legislative council in 1957 was introduced by a Uganda National Congress member but was defeated by 45 votes to 9. Almost simultaneously the Buganda government, acting under the terms of the 1955 agreement, appointed a committee to consider methods of introducing direct elections to the legislative council from Buganda in 1957. On April 24 the governor, Sir Andrew Cohen, announced that direct elections on a common roll would be introduced for the whole protectorate in 1961 irrespective of Buganda's decision regarding 1957. The year 1961 was not, however, a target date for self-government. Earlier in the month the Congress party had organized a "self-government week." In June, however, the Buganda *lukiko* (council) rejected a motion for direct elections to the *lukiko*. Discussions between the Toro *rukurato* (council) and the protectorate government regarding new constitutional arrangements for Toro broke down when the Toro representatives rejected the District Councils ordinance as a basis for the proposed changes. Later discussions between the governments of Buganda and Bunyoro concerning the future of the so-called "lost counties," formerly part of Bunyoro but for more than 60 years included in Buganda, also proved fruitless. In May the executive council met for the first time in Mbale in the hope of widening public interest in the council's work.

The legislative council, meanwhile, resolved itself into a committee of supply for the first time when considering the annual estimates for 1956-57.

The western extension of the railway to Kasese was completed in March and the service began on Aug. 1. The line was officially opened on Nov. 23. In July a £6,000,000 loan floated by the Uganda Electricity board was fully subscribed within a short time and in October the board sought expert advice on the likely demand for electricity in the period 1956-70.

Zanzibar.—In January W. F. Coutts submitted his report on the method of choosing the 12 proposed unofficial members of the legislative council. Six were to be elected and six seats were to be allocated to racial groups. As a result of the influence of the Aga Khan, the Arab members agreed to sit in the legislative council once more although they had boycotted Coutts' inquiry. In August the council with its full Arab complement accepted the Coutts report. In September provisional plans were announced for the creation of a privy council, the inclusion of unofficial members in the executive council and the enlargement of the legislative council.

(K. I.)

Education.—*Kenya* (1955). Primary schools: European 43, pupils 6,762, teachers 310; others (Arab, Asian and African schools) 3,808, pupils 425,925, teachers 9,835. Secondary: European 11, pupils 2,283, teachers 168; others 41, pupils 8,707, teachers 597. Vocational schools 8, pupils 1,312, teachers 172.

Somaliland Protectorate (1954). Primary: grant-aided private Koranic schools 45, pupils 1,549; government schools 16. Secondary: pupils 60. Vocational centre 1, trainees 40.

Tanganyika (1954). Primary: European 29, pupils 1,845; African, pupils 275,628 (middle schools, pupils 25,480); Indian 98, pupils 13,618. Secondary: European 2, pupils 200; Indian 36, pupils 4,511; African, pupils 2,956. Teacher-training centres 2,049 students. Agriculture and trade schools: 600 students. Higher education provided by the university college of Makerere, Uganda, 113 Tanganyika students.

Uganda (1955). Primary: grant-aided 1,890, pupils 258,830, teachers 8,823; unaided 2,251, teachers 2,527. Secondary: grant-aided 136, pupils 12,210, teachers 703; unaided 39, teachers 113. Vocational: grant-aided 47, pupils 3,049, teachers 590; unaided 31.

Zanzibar (1955). Primary 67, pupils 13,428, teachers 438; secondary

4, pupils 627, teachers 41. Teacher-training 122.

Finance and Trade.—Monetary unit: East African shilling, divided into 100 cents, valued at parity with the shilling sterling and at 14 cents U.S.

	Revenue (1955-56 est.)	Expenditure (1955-56 est.)	Imports (1955)	Exports (1955)
Kenya	£35,337,000	£38,726,000	£71,500,000	£28,000,000
Somaliland Prot.	1,395,000	1,395,000	2,880,000	1,373,000
Tanganyika	19,468,000	19,669,000	43,500,000	37,400,000
Uganda	16,383,000	19,149,000	34,000,000	42,300,000
Zanzibar	2,606,000	2,358,000	6,702,661	6,781,695

Note circulation: (June 1954) £41,831,000; (June 1955) £49,082,000. Principal exports (1955): *Kenya*, coffee, sisal, hides and skins, wattlebark extract, sodium carbonate, pyrethrum. *Somaliland Prot.*, hides, skins, gums livestock. *Tanganyika*, sisal, coffee, cotton, diamonds, hides, gold. *Uganda*, coffee £20,134,103, cotton £16,386,472, hides and skins, tea. *Zanzibar*, cloves and clove oils, coconut oil, copra.

British Guiana. This British colony in northeast South America lies between Venezuela (west), Brazil (southwest and south) and Surinam (east). Area: 82,997 sq.mi. Pop.: (1946 census) 375,701; (1955 est.) 485,000, including 221,000 East Indians, 170,000 Negroes, 52,500 mixed, 19,000 Amerindians, 13,100 Europeans (two-thirds Portuguese). Language: English; various East Indian. Religion (1946 census): Christian 60%; Hindu 30%; Moslem 8%. Principal towns (pop. 1954 est.): Georgetown (cap.) 92,098, New Amsterdam 12,826. Governor in 1956, Sir Patrick Renison.

History.—The constitution that had been suspended in 1953 was partially restored in 1956. The terms announced in April were later modified in response to representations made by a conference of all the colony's political parties, and then provided for a legislative council of 28 members, and for an executive council with the governor as president. It was planned that elections should take place in the spring of 1957. A special revision order was passed in February to provide for the bringing and keeping up to date of the electoral register. A revised edition of the colony's laws came into force on Jan. 15. The arrival of a senior administrative officer marked the start of practical work on the reform of local government.

The British Guiana Trades Union council was admitted to membership of the International Confederation of Free Trade Unions. A long-standing wage dispute in the sugar industry went to arbitration and the workers were awarded a 10% increase in their cost of living supplement. At Plantation Wales, West Bank Demerara, a start was made on a scheme for leasing 10-ac. plots of cane land to approved tenants, the estate management to perform certain agreed services and to buy cane for processing at agreed rates. A B.W.I. \$2,000,000 (British West Indian dollars) rice mill was opened by the government at Anna Regina, Essequibo coast. A regional rice agreement gave British Guiana preferential rights as supplier of rice to the British Caribbean colonies, excepting British Honduras (*see* BRITISH WEST INDIES).

Ordinary revenue for the year was estimated at B.W.I. \$40,113,775 and expenditure at B.W.I. \$39,954,071. The separate development budget was balanced at B.W.I. \$26,711,648, including Colonial Development and Welfare aid worth B.W.I. \$9,925,799. A loan of £3,540,000 (B.W.I. \$16,992,090) was floated in April, £3,000,000 being offered in London and the rest subscribed from local government funds. Later a local loan of B.W.I. \$1,750,000 was raised for rehabilitation of the telecommunications system. The development program for 1956-60, published during the year, called for expenditure of B.W.I. \$57,000,000 for economic and B.W.I. \$34,000,000 for social development. (R. H. Y.)

Education.—(1955) Government and aided schools: primary 301, pupils 95,258, teachers 2,424; secondary 4, pupils 1,511 (excluding private schools with about 6,000 pupils), teachers 82; vocational 3, pupils 1,347, teachers 25; 1 teachers' training college, students 57; higher education, 322 students.

Finance and Trade.—Monetary unit: British West Indian dollar, B.W.I. \$1.7=U.S. \$1. Budget (1955 actual in British West Indian dollars): revenue \$42,496,467; expenditure \$40,194,706. Foreign trade (1955, in B.W.I. dollars): imports \$94,517,619; exports \$89,004,202. Principal exports:

sugar, bauxite, rice, rum, diamonds, timber, molasses. Production (metric tons, 1955): sugar 250,000; bauxite 2,435,282.

ENCYCLOPÆDIA BRITANNICA FILMS.—*Caribbean* (1955).

British Honduras. This British colony in Central America is bounded by Mexico (north and west), Guatemala (west and south) and the Gulf of Honduras and Caribbean sea (east). Area: 8,867 sq.mi. Pop.: (1946 census) 59,220, including 22,693 Creoles and 10,030 Indians (Maya); (Dec. 1954 est.) 78,094. Languages: English, Spanish, Indian dialects. Religion: mainly Roman Catholic. Chief towns (pop., 1953 est.): Belize (cap.) 27,500; Stann Creek 3,500. Governor in 1956, C. H. Thornley.

History.—Following the devastation of the northern districts by Hurricane "Janet" in Sept. 1955, the colonial office approved a relief and reconstruction program costing £900,000, of which £500,000 was in the form of a free grant. At the Caribbean federation conference, held in London in Feb. 1956, the observer from British Honduras expressed the wish to "leave the door open to federation," although British Honduras was not at that time prepared to join in any political federation with the West Indies. In the political field, the People's United party, which had a majority in the government, suffered a split among its leaders and a new party was formed called the Honduran Independence party. Preparations began for the 1957 elections, the second election to be held with universal adult suffrage. In May a ten-man agricultural team visited the country for 20 days with a view to advising and recommending on the possibilities for agricultural and fisheries development and to draw up plans for such development, including the processing of primary products. Toward the end of the year the official radio station of Guatemala, after a silence of more than one year, resumed its anti-British broadcasts beamed at British Honduras. (A. L. A.)

Education.—Schools (1954): grant-aided primary 95 (including 60 controlled by Jesuit missions), pupils 13,716; independent primary 27, pupils 3,350; secondary 9, pupils 1,192; 1 technical high school, pupils 92; teachers' training college opened June 1954.

Finance and Trade.—Monetary unit: British Honduras dollar, B.H. \$1.42 = U.S. \$1. Budget (1955 est.): revenue (including grants) £1,215,000; expenditure £1,243,000. Foreign trade (1955): imports £3,580,000; exports £2,050,000. Principal exports: timber, chicle, citrus fruits and juice, copra.

ENCYCLOPÆDIA BRITANNICA FILMS.—*Caribbean* (1955).

British Somaliland: see BRITISH EAST AFRICA.

British South African Territories. Basutoland (colony), an enclave within southeastern Union of South Africa; Bechuanaland protectorate, north of the Union; and Swaziland (protectorate), between Transvaal and Mozambique, are generally referred to as the High Commission Territories in South Africa.

	Area (sq.mi.)	Population (1946 census)	Population (1955 est.)	Capital (with est. pop.)
Basutoland	11,716	563,854	590,000	Maseru (4,000)
Bechuanaland Prot.	274,517	296,310	296,000	*
Swaziland	6,704	185,215	217,000	Mbabane (1,600)

*Administrative headquarters are at Mafeking, Cape Province, Union of South Africa.

Population is Basuto, Bechuana, Swazi: in Bechuanaland the most important tribe is Bamangwato (100,987 at 1946 census), with its capital at Serowe (15,935). Europeans (1946): Basutoland 1,689; Bechuanaland 2,379; Swaziland 3,201. Religion: Christian (Basutoland [1946] 345,986); various indigenous. High commissioner in 1956: Sir Percivale Liesching. Resident commissioners: (Basutoland) A. G. Chaplin; (Bechuanaland) J. O. Wray; (Swaziland) B. A. Marwick.

History.—*Basutoland.*—The paramount chief and the Basuto national congress objected to the appointment of A. G.

Chaplin as resident commissioner on the ground that, although an experienced member of the colonial service, he was a white South African in origin. The tribal authorities stated they would decline to co-operate with him in native administration, but his appointment was confirmed.

The possibilities of exploiting the water resources of the colony were discussed in an engineering report. It outlined three practical schemes to harness the silt-free waters of the Orange river high up in the Drakensberg mountains. Sufficient hydro-electric power could be generated not only to supply all Basutoland's needs but also to provide the neighbouring Orange Free State goldfields with more electricity.

Bechuanaland.—In September Seretse Khama, exiled chief of the Bamangwato tribe was granted permission to return from Great Britain to Bechuanaland as a private citizen.

Swaziland.—Improved communications were planned as a result of a report by Sir Arthur Griffin. Large expenditure on roads was contemplated and the building of a railway line to serve the territory was again under discussion. (J. U. L.)

Education.—(1955) *Basutoland* (African): primary 936, pupils 102,605, teachers 2,013; secondary 12, pupils 1,175, teachers 56; technical and vocational 8, pupils 371, teachers 34; teacher training 6, students 319, teachers (including postsecondary) 68. (European): primary 7, pupils 153, teachers 10. *Bechuanaland* (African, European and Eurafican): primary 160, pupils 21,773, teachers 616; secondary 4, pupils 302, teachers 15; vocational 1, pupils 22, teachers 2; teacher training 1, students 55. *Swaziland* (African, European and Eurafican): primary 245, pupils 21,407, teachers 395; secondary 9, pupils 687, teachers 56; 1 trade school, pupils 53; teacher training 2, students 75.

Finance and Trade.—Monetary unit: South African pound (£[S.A.]1 = £1 sterling = U.S. \$2.80).

	Budget (1954–55)		Foreign trade	
	Revenue	Expenditure	Imports	Exports
Basutoland	£1,389,828	£1,451,021	(1954) £2,612,007	£1,930,486
Bechuanaland	£1,054,671*	£1,078,735*	(1955) £2,462,495	£2,821,647
Swaziland	£1,052,579*	£1,024,293*	(1954) £2,386,332	£3,134,462

*Including development and welfare grants.

Principal exports: *Basutoland*, sorghum, hides and skins, wool, mohair, livestock. *Bechuanaland*, livestock, dairy produce, hides and skins, gold. *Swaziland*, asbestos, livestock, hides and skins, wattle bark extracts, tobacco, rice, tin.

British West Africa: see GAMBIA; GOLD COAST; NIGERIA; SIERRA LEONE; TRUST TERRITORIES.

British West Indies. Under this heading are treated matters of common concern to Jamaica, the four Leeward Island colonies (Antigua, St. Kitts-Nevis-Anguilla, Montserrat and the British Virgin Islands), the four Windward Island colonies (Grenada, St. Vincent, St. Lucia and Dominica), Trinidad and Tobago, Barbados, and the mainland colonies of British Guiana and British Honduras. Total area: 99,961 sq.mi. Population (1954 and 1955 est.) 3,487,345. (See also articles on the individual colonies.)

History.—A conference held in London in February under the chairmanship of the secretary of state for the colonies was attended by plenipotentiaries from all the colonies that had agreed to join the British Caribbean federation and by observers from British Guiana and British Honduras. The federal plan of 1953 was finally accepted subject to some minor variations; the way was left open for the subsequent accession of British Guiana and British Honduras. The representatives of the West Indian governments at the conference were constituted a standing federation committee. A federal secretary, chief justice, attorney general, finance officer, establishment officer and information officer were appointed to a provisional federal government with temporary headquarters in Barbados. The British Caribbean Federation act, providing for a federal constitution to be embodied in an order in council, received the royal assent on Aug. 2, which date was celebrated as a public holiday in the British West Indies. A Caribbean Federal Labour party was inaugurated at a meeting in St. Lucia in September with N. W. Manley (Ja-

maica) being named president and G. H. Adams (Barbados) and R. L. Bradshaw (St. Kitts) vice-presidents.

Colonial development and welfare aid to the West Indies in the year ended March 31, 1956, totalled £4,586,257. The price of sugar under the commonwealth sugar agreement was £40 15s. a ton. West Indian producers were represented on a U.K. delegation to a United Nations conference to review the international sugar agreement. An agreement running from Oct. 1, 1956 to Sept. 30, 1959, named British Guiana as the sole exporter of rice to the region, with a view to supplying the other British Caribbean territories (except British Honduras) with their total rice requirements. British Guiana undertook not to sell rice elsewhere before surpluses had been offered to Caribbean consumers, who in turn might import from elsewhere only if British Guiana could not meet their requirements.

Hurricane "Betsy" caused damage and some deaths in Dominica, the Leeward Islands, Puerto Rico and the Bahamas.

Brownell, Herbert, Jr. (1904–), U.S. government official, was born on Feb. 20 at Peru, Neb. He received his bachelor's degree at the University of Nebraska, Lincoln, in 1924 and his law degree at Yale university in 1927. He practised law in New York city and in 1932 was elected as a Republican to the New York state assembly, where he served two terms. In 1942 he was campaign manager for Thomas E. Dewey in the latter's successful bid for the governorship of New York. Brownell also managed Dewey's campaigns for the Republican presidential nomination in 1944 and 1948 and was chairman of the Republican national committee from 1944 to 1946. He was an early supporter of Dwight D. Eisenhower and chief strategist in the latter's campaign for the presidential election in 1952. Eisenhower on Nov. 21, 1952, named Brownell attorney general in his cabinet, and he took office on Jan. 21, 1953.

Brownell announced on July 4, 1956, that the department of justice was preparing an antitrust suit against General Motors corporation for alleged monopolistic practices in the sale of buses. On July 15 Brownell reported that the government had 99 antitrust suits in the federal courts or pending.

Broz, Josip (Tito): see TITO (JOSIP BROZ).

Brucker, Wilber Marion (1894–), U.S. secretary of the army, was born on June 23 at Saginaw, Mich., and received his law degree from the University of Michigan, Ann Arbor, in 1916. He served with the U.S. national guard in the Mexican expedition of 1916 and was an infantry officer with the American expeditionary forces in World War I, receiving the silver star.

After World War I he was admitted to the Michigan state bar (1919) and practised in his native city of Saginaw. From 1923 to 1927 he was prosecuting attorney for Saginaw county and from 1927 to 1928 assistant attorney general of Michigan; in 1928 he became attorney general of the state, serving until 1930. A Republican, he was elected governor of Michigan in 1930 for the term 1931–33 but was defeated for re-election in 1932.

On April 6, 1954, Brucker was nominated general counsel of the federal department of defense, and his appointment was confirmed April 19. When Robert T. Stevens resigned as secretary of the army, Pres. Dwight D. Eisenhower on June 22, 1955, nominated Brucker to succeed him in that office.

Brucker announced on March 23, 1956, that the army had developed a "master missile" which could detect enemy aircraft and missiles and at the same time co-ordinate the fire of all U.S. anti-aircraft missiles in the area of enemy attack.

Budget, National. **United States.**—In a report dated Aug. 28, 1956, the bureau of the budget reviewed the budget of the United States for the fiscal year ending June 30, 1957. The report presented revisions of the original fiscal 1957 estimates contained in the Jan. 1956 budget document, together with actual expenditures and receipts data (instead of estimates) for the fiscal year 1956. The revised budget estimates for 1957 took into account congressional action and other developments which had occurred since January.

Budget receipts for fiscal year 1957 were expected to reach the record total of \$69,800,000,000, as compared with \$68,100,000,000 in the previous year. (See Table I.) Individual income taxes were scheduled to show the largest increase, "reflecting the record high level of the nation's personal incomes." Budget expenditures in fiscal 1957 were estimated at \$69,100,000,000—an increase of \$2,700,000,000 over 1956.

The midyear budget review thus anticipated a surplus of \$700,000,000 in the fiscal year 1957, and reported a surplus of \$1,800,000,000 for fiscal 1956. These successive balanced budgets followed deficits in the four-year period 1952–55; a budget surplus of \$3,500,000,000 had been realized in fiscal 1951.

The surplus of \$700,000,000 for fiscal 1957 was not very different from the estimate of \$400,000,000 which had been presented in the January budget document. However, there were upward revisions of \$4,300,000,000 in budget receipts (attributed to "increased business activity and higher personal incomes") and \$4,000,000,000 in budget expenditures (more than half of which occurred in Commodity Credit corporation farm expenditures—an unusually difficult item to estimate).

Table I.—Summary of Budget Receipts and Expenditures, United States
Fiscal Years 1955, 1956 and 1957

Description	1955 actual	1956 actual	1957 estimate
Budget receipts:			
Individual income taxes . . .	\$31,650,000,000	\$35,337,000,000	\$37,500,000,000
Corporation income taxes . . .	18,265,000,000	21,297,000,000	21,500,000,000
Excise taxes* . . .	9,211,000,000	10,004,000,000	9,300,000,000
Employment taxes . . .	6,220,000,000	7,296,000,000	7,465,000,000
Estate and gift taxes . . .	936,000,000	1,171,000,000	1,210,000,000
Customs . . .	606,000,000	705,000,000	725,000,000
Miscellaneous receipts . . .	2,566,000,000	2,987,000,000	3,160,000,000
Subtotal . . .	69,454,000,000	78,796,000,000	80,860,000,000
Deduct			
Transfer to federal old-age and survivors' insurance trust fund . . .	5,040,000,000	6,337,000,000	6,500,000,000
Transfer to railroad retirement trust fund . . .	599,000,000	634,000,000	660,000,000
Refunds of receipts . . .	3,426,000,000	3,684,000,000	3,900,000,000
Total budget receipts* . . .	60,390,000,000	68,141,000,000	69,800,000,000
Budget expenditures:			
Major national security . . .	40,626,000,000	40,478,000,000	40,824,000,000
International affairs and finance . . .	2,181,000,000	1,852,000,000	2,144,000,000
Veterans' services and benefits . . .	4,457,000,000	4,757,000,000	4,827,000,000
Labour and welfare . . .	2,552,000,000	2,776,000,000	3,001,000,000
Agriculture and agricultural resources . . .	4,411,000,000	4,914,000,000	5,744,000,000
Natural resources . . .	1,081,000,000	961,000,000	1,133,000,000
Commerce and housing* . . .	1,622,000,000	2,165,000,000	1,970,000,000
General government . . .	1,201,000,000	1,631,000,000	2,093,000,000
Interest . . .	6,438,000,000	6,852,000,000	7,156,000,000
Allowance for contingencies . . .	—	—	200,000,000
Total budget expenditures* . . .	\$64,570,000,000	\$66,386,000,000	\$69,093,000,000
Budget deficit (–) or surplus (+) . . .	–\$4,180,000,000	+\$1,754,000,000	+\$707,000,000

*Public law 627, 84th congress, provided that certain receipts from excises on motor fuel, tires and vehicles would go into a trust fund from which federal-aid highway expenditures would be made in 1957 and succeeding years. Previously, receipts and expenditures of this nature were included in the budget totals. To this extent, the 1957 estimates for the items indicated above are not comparable to the figures for previous years. The amounts involved (in millions of dollars) are as follows: budget receipts—977 in fiscal 1955 and 1,055 in 1956; budget expenditures—595 in fiscal 1955 and 740 in 1956; trust fund receipts—1,500 in fiscal 1957; trust fund expenditures—1,150 in fiscal 1957.

WAIT A WHILE—I THINK I HAVE IT!" a 1956 cartoon by Fischetti of the IEA Service, Inc.

The budget report noted that "major national security programs"—the military functions of the department of defense, the military portion of the Mutual Security program, atomic energy and stockpiling and defense production expansion—accounted for about 60% of the 1957 budget. Expenditures for these programs, estimated at \$40,800,000,000 for 1957, had risen from \$13,000,000,000, or 32% of the total budget, in fiscal year 1950, the last full year before the outbreak of aggression in Korea, to a peak of \$50,400,000,000, or 68% of the budget, in 1953. National security outlays in 1955 and 1956 were approximately \$40,500,000,000.

The next largest expenditure category was interest. Payments of interest, primarily on the national debt, were estimated at little over \$7,100,000,000 for fiscal 1957, or 10% of the total budget. Expenditures for agricultural programs, totalling \$5,700,000,000, amounted to more than 8%. Veterans' benefits were expected to absorb about \$4,800,000,000 of the \$69,100,000,000 expenditure aggregate. Outlays for labour and welfare programs were estimated at \$3,000,000,000. The remainder of the 1957 budget, covering a wide variety of functions, amounted to \$7,000,000,000, or 11%.

Major National Security.—Of the \$40,824,000,000 total of national security expenditures estimated for fiscal year 1957, \$36,000,000,000, or 88%, was allocated for military functions of the department of defense. This was a few hundred million dollars higher than in 1955 or 1956 but \$4,300,000,000 less than in 1954. It was reported in the budget review that the nation's military forces in 1957 would be "stronger and more effective than in any previous year in peacetime history."

Expenditure increases in 1957 over 1956 were anticipated for operation and maintenance ("due to the growing number of complex new weapons and techniques"), reserve components, research and development (because of the added emphasis given to aircraft and guided-missile projects) and retired pay. The largest expenditure reduction (\$562,000,000) was listed for major procurement. It centred in conventional ammunition and support vehicles, with outlays for guided missiles scheduled to increase markedly.

Expenditures for military functions of the Mutual Security

program amounted to \$2,500,000,000 in the 1957 budget, approximately the same as in 1956. These expenditures cover military equipment and training for friendly nations.

Atomic Energy commission outlays for 1957 were recorded at \$1,980,000,000 in the budget report. These would be the highest in history, and \$326,000,000 above 1956. Increased spending was projected for the procurement of uranium concentrates, for the development of atomic reactors for military propulsion (ships and aircraft) and for civilian atomic power.

Net expenditures for the stockpiling of strategic materials and expansion of defense production were estimated to decline by \$243,000,000 in 1957 from the 1956 level of \$587,000,000. The decline reflected primarily the expectation that several large loans made by the Reconstruction Finance corporation under authority of the Defense Production act would be repaid as the borrowers concluded arrangements for private financing.

International Affairs and Finance.—Budget expenditures for international programs of the government in fiscal 1957 were estimated at \$2,144,000,000, up \$292,000,000 from 1956. The largest part of this increase was for the economic portion of the Mutual Security program, for which outlays would be increased to \$1,750,000,000 as compared with \$1,590,000,000 in fiscal 1956. These increased expenditures were earmarked mainly for the less developed areas of the world, especially in the far east.

Veterans' Services and Benefits.—The revised budget for fiscal year 1957 placed expenditures for veterans' programs at \$4,827,000,000—\$70,000,000 more than in 1956. Increased expenditures were noted for compensation and pensions, hospital construction and readjustment benefits (covering principally education and training). Partly offsetting was a substantial decrease in outlays for veterans' insurance programs. This reflected a nonrecurring reimbursement that was made to the national service life insurance fund in 1956.

Labour and Welfare.—Expenditures for labour and welfare programs were estimated at \$3,001,000,000 for 1957, or \$225,000,000 more than in 1956. Increases were projected chiefly in four types of programs—public assistance grants to the states, which were estimated at \$1,571,000,000 for 1957; medical research; grants for the construction of hospital and other health facilities; and the school lunch program.

Agriculture and Agricultural Resources.—Budget expenditures for operating agricultural programs of the government in fiscal 1957 were estimated to be \$830,000,000 more than in 1956. With expenditures in this category showing a marked uptrend, the total of \$5,744,000,000 anticipated for 1957 was more than double average outlays in 1953 and 1954.

The estimated increase from 1956 to 1957 reflected the net effect of: (1) outlays of about \$1,000,000,000 for the new soil bank program; (2) a decline of \$320,000,000 for the Commodity Credit corporation price support and commodity purchase program; and (3) a rise of \$150,000,000 for all other agricultural activities of the government. In the last category, the largest increase (\$86,000,000) was for removing surplus commodities from the market and distributing them to schools, charitable institutions and other eligible outlets.

Natural Resources.—The government's programs to conserve and develop natural resources were estimated to require expenditures of \$1,133,000,000 in fiscal year 1957 as compared with \$961,000,000 in the previous year. Increases were scheduled for the flood control, reclamation and multiple-purpose power projects of the corps of engineers and the bureau of reclamation; for a new program by which the government would purchase limited quantities of minerals to help domestic mineral industries adjust from defense-stimulated needs to more normal market conditions; for construction work of the Tennessee Valley authority;

Table II.—Government Receipts and Expenditures—Great Britain
(£ millions)

Receipts	Exchequer Receipts, 1955-56	Estimate, 1956-57	Expenditures	Exchequer Issues, 1955-56	Estimate, 1956-57
Income tax	1,943	2,086	Debt service	674	707
Surtax	139	144	Payments to North Ireland exchequer	59	61
Death duties	176	170	Other	10	10
Stamps	71	59	Total consolidated fund services	744	778
Profits tax and excess profits tax	211	221	Supply services:		
Other inland revenue duties	1	1	Defense	1,405	1,499
Total inland revenue	2,540	2,680	Civil	2,286	2,408

Receipts from sundry loans	30	30			
Miscellaneous	198	210			
Total ordinary revenue	4,893	5,198			

Detail will not necessarily add to totals because of rounding.

for expansion of the national park service; and for a newly established loan fund for the fishing industry.

Commerce and Housing.—Net budget expenditures for commerce and housing programs in 1957 were shown in the midyear budget report to be \$195,000,000 less than in 1956. The decline was the result of the shift of the federal-aid highway program to a separately financed highway trust fund. Federal-aid highway expenditures under the new legislation were expected to be substantially larger than the actual 1956 budget expenditures of \$740,000,000, but were not included in the 1957 budget totals. (See footnote to Table I.)

Apart from federal-aid highways, commerce and housing expenditures were estimated to show a net rise of \$545,000,000 in the fiscal year 1957. This reflected increases in most programs comprising this varied category.

General Government.—Expenditures for general government services and activities in fiscal 1957 were included in the budget at \$2,093,000,000, about \$460,000,000 more than in 1955. The largest single increase, \$292,000,000, was in the federal payment to the civil service retirement and disability fund. In addition, a marked increase was scheduled for outlays to speed modernization or replacement of government buildings.

Interest.—Interest payments by the federal government were expected to rise by \$304,000,000 to a total of \$7,156,000,000 in fiscal year 1957. The advance was attributed to higher market rates of interest. These would increase the amount of interest payable on new securities and on those issued to finance maturing obligations.

Great Britain.—The 1956-57 budget of Great Britain showed total receipts of £5,198,000,000, about £300,000,000 higher than in the preceding year. (See Table II.) This anticipated increase reflected expanded personal incomes and the effects, in their first full year, of the tax changes that had been made in the 1955-56 budget.

Several revisions in tax schedules were proposed in the April 1956 budget document, but were expected to have little net effect on total revenue. They included exemptions from income tax of the first £15 of interest received from certain savings institutions and of premiums (not to exceed £500 or 10% of earned income) for the purchase of life annuities by self-employed persons. Approximately offsetting these reductions, estimated to cost from £40,000,000 to £60,000,000 on a full-year basis, were increases in the tax rates on distributed and undistributed profits and higher customs duties on tobacco.

Total budget expenditures were estimated to increase from £4,496,000,000 in fiscal 1955-56 to £4,738,000,000 in fiscal 1956-57. Defense costs, comprising about one-third of total expenditures, were scheduled to advance by £94,000,000. Higher expenditures for the national health service, assistance to local

areas (chiefly for education) and national debt service largely accounted for the remainder of the estimated increase in governmental outlays.

The 1956-57 budget provided for a surplus of £460,000,000. This was slightly larger than the £397,000,000 surplus of ordinary receipts over ordinary expenditures in the preceding year.

Building and Construction Industry. Since the end of World War II, building and construction activity in the United States each year has exceeded the previous 12-month period, and estimates of the future have constantly been revised upward. In the first nine months of 1956, the value of construction work put in place amounted to about \$32,700,000,000, or about 2% over the comparable period of the previous year. (See Table I.) This was equivalent to an annual rate of \$44,500,000,000, compared with actual outlays of \$43,000,000,000 in 1955.

The advances were made despite the fact that private residential construction, while constituting about one-third of the total, declined by 9% as a result of a contraction in the availability of mortgage credit. The drop in this sector was more than compensated by increases in virtually all other types of private building activity. The construction of factories and other industrial plants rose by 29%, and expenditures for commercial buildings, including offices, warehouses, stores and restaurants, were 13% higher than the previous year.

Expenditures for public construction, which constituted about 30% of the national total in the first nine months of 1956, were 6% above the January to September total in 1955. The construction of schools, highways, sewer and water facilities, and public service enterprises were at peak levels, while public industrial construction, consisting principally of atomic installations, sagged to half of the previous year's total. Public residential building showed a moderate decline of 5% in the first nine months, but it was anticipated that the year-end total would equal or exceed 1955 levels.

Construction Costs.—As the volume of construction moved upward, the pressure on building resources increased and the amount of construction that a dollar could purchase shrank. The composite cost index of the department of commerce reached a new high of 131.3 (1947-49=100) in July 1956, continuing the regular increases that began earlier in the year. The index for July 1955 was 5% higher than a year earlier with three-fourths of the advance taking place in the latter half of the previous 12-month period. The various types of construction, ranging from

small frame residences to heavy engineering projects, showed about the same general increase in cost.

The wholesale prices of basic building materials jumped 4% between July 1955 and July 1956, according to the bureau of labour statistics index, with most of the change taking place in the latter half of 1955. With the exception of some lumber products, iron fixtures and insulation, the prices of virtually all materials showed increases in the course of the year. The greatest price increases were found in plumbing fixtures (up 19%), asphalt roofing (up 7%), hardwoods (up 7%) and building board (up 6%). The price of structural steel shapes remained unchanged, not yet reflecting the rise in steel prices that followed the signing of new and higher wage contracts during July 1956.

In midyear 1956, the output of most major building materials was at lower levels than in the same point of the previous year. The greatest decline was in the production of asphalt products, which was 19% lower in June 1956, than in the comparable month of 1955. The manufacture of heating and plumbing equipment and mill work each declined 13%, during this period, while paint and wood products declined 10% and 9% respectively. The mixed character of the market is shown, however, by the fact that the output of portland cement, iron and steel products, and clay construction products, was higher in June 1956 than in any previous June.

Employment and Earnings.—It always had been known that the building and construction industry was an important source of employment for United States workers. A recent revision of the estimates of employment in this industry undertaken by the bureau of labour statistics revealed that the previous statistics, particularly those for the more recent years, were marked understatements. For the year 1955, the previous data showed a

Table II.—Average Union Wage Scales for Selected Trades, July 1956

Trade	High	Rate level		Increase July 1955-July 1956 Cents per hour	Per cent
		Aver- age	Low		
Bricklayers	\$4.05	\$3.63	\$2.50	16	5
Carpenters	3.65	3.13	1.88	12	4
Electricians	4.00	3.33	2.38	16	5
Painters	3.35	3.02	1.75	15	5

Plumbers	3.75	3.34	2.40	15	5
Building labourers	3.00	2.18	1.00	14	7

Source: Bureau of Labor Statistics.

total employment of 2,506,000 workers, while the revised figure put the level at 2,780,000. The sharpest revisions came in figures for the summer months, with June 1955 having been estimated at 2,928,000 instead of 2,615,000 shown in the previous tabulations.

On the basis of the revised data, total employment in the industry stood at 3,296,000 in July 1956, an increase of 264,000 over the same month of the previous year. Special trade contractors (plumbing, heating, electrical work, etc.) engaged approximately one-half of the workers and general contractors one-third. The remainder were employed on streets, highways and other nonbuilding activities.

Increases in the work hours and in hourly earnings brought the wages of building workers to \$103.25 a week in June 1956, the highest amount on record. This figure was \$2.64 above the previous peak which occurred in Sept. 1955, and stood \$6.62 above the June 1955 average. Hourly earnings for the industry as a whole, which averaged \$2.71 in June 1956, (14 cents over June 1955) also set a new record. The average work week during this month was 38.1 hours, or one-half hour longer than a year earlier.

The trade union wage scales in the building industry experienced substantial increases in the course of the year. With few exceptions, minimum union rates rose in all areas of the United States, and the average hourly rates increased for all crafts. (See Table II.) Bricklayers, electricians, painters and plumbers received average increases of 15 or 16 cents per hour, a rise equivalent to 5% of their previous rates. Increases in other crafts were slightly lower, ranging from 11 to 14 cents per hour. Thus, by July 1955, organized building workers could again lay claim to being among the highest paid in the nation, with bricklayers receiving \$3.63 on the average for straight time and building labourers drawing \$2.18 per hour on the average.

The National Highway Program.—A national highway program of unprecedented scope was passed by congress in 1956 after years of discussion and investigation. During the next 13 years it was anticipated that more than \$100,000,000,000 would be spent by federal, state and local governments for land acquisition and engineering in addition to the untold billions that would be

invested in ancillary facilities and installations. Between 1957 and 1969, more than 40,000 mi. of reinforced concrete and asphalt highways would be constructed, forming a network that would link all cities with a population in excess of 50,000 persons. In addition, the established program of primary, secondary and urban road systems carried forth with federal aid would be continued, and in all probability there would be an increase in the construction of state and local roads outside the other systems.

According to estimates of the U.S. bureau of public roads and the American Road Builders association, the expanded highway construction program would require between one-half and two-thirds more materials than were currently being absorbed by road building. These included such materials as steel, cement, lumber, concrete, petroleum products and explosives, all of which were in demand for other types of construction activity. Moreover, enormous amounts of new equipment would be required, involving additional billions of expenditure.

Approximately 1,000,000 new jobs would be created by the program, half of which would be on the road and half in the off-site production of materials and in planning and design.

Urban Renewal.—The attempts to eliminate slum and blighted areas and to place valuable urban land into pleasant and productive use moved forward in 1956. By July 31, the Urban Renewal administration reported that capital grant reservation amounting to \$670,000,000 to subsidize the write-down of slum land had been made for 386 projects located in 233 areas throughout the United States and its possessions. Plans for 127 projects had been approved for execution, and an additional 258 were in either the preliminary or final planning stages.

To further this program, congress, in the Housing act of 1954, made provision for experimental studies of methods and techniques that could be devised in a field in which little experience had been accumulated. By mid-1956, 13 such "section 314" demonstration projects were under way in a number of cities with a variety of approaches.

In New York city, a 20-block area on the west side of Manhattan was being subjected to intensive study to determine those structures that should be demolished, those that should be remodelled or reconditioned, and those that should be left untouched. A team of architects, engineers, economists, lawyers and population housing experts began work in the summer of 1956, and a report containing a program of action was due early in 1957.

Philadelphia, Pa., received section 314 funds to conduct a leadership program in four areas of that city that had declined but had not reached a slum state. An attempt was being made on the neighbourhood level to secure the voluntary co-operation of both landlords and homeowners to make needed repairs, adapt the dwellings to more satisfactory family use and to improve the appearance of structures. A considerable degree of success was reported, but some resistance came from homeowners with low incomes and from absentee landlords who held their properties on their equities.

A grant was also given to the city of Cleveland, O., to help establish a neighbourhood improvement centre to provide professional help on architecture, construction and mortgage finance to property owners undertaking rehabilitation work.

Detroit, Mich., was studying the causes of civic decay and organizing the aids available to rebuild and rehabilitate its blighted sectors. The study sought to find an optimum balance between conservation and rehabilitation and determine its relationship to a long-range capital improvement program for that city.

In July 1956, the Urban Renewal administration announced a major change in its application and reporting procedures de-

signed to shorten the time for local communities to get slum clearance and rehabilitation projects and to reduce red tape and paperwork in qualifying for federal urban renewal assistance. This measure was presumably taken in response to the appeals of local communities who alleged that their renewal programs had been delayed by the length of time necessary to secure clearance from Washington, D.C.

In general, the changes placed great emphasis on direct review and consultation on local progress through the use of field personnel, and less on the review of detailed documentation by the central office. In addition, the streamlining eliminated the interim planning reports on renewal projects and required only general data on the character and nature of an area at the time of application, leaving the final determination until detailed planning and survey data were developed.

ENCYCLOPÆDIA BRITANNICA FILMS.—*Building America's Houses* (1947); *The Living City* (1953).

Bulganin, Nikolai Alexandrovich

(1895–), Soviet political

leader, was born at Nizhny Novgorod (now Gorky), June 11. He joined the Communist party in 1917 and from 1922 held executive posts in the Higher Council of National Economy. From Jan. 1931 he was secretary of the Moscow city committee or "mayor" of the Soviet capital. He became chairman of the council of people's commissars of the R.S.F.S.R. in 1937 and during 1938–41 he was also deputy chairman of the council of people's commissars of the U.S.S.R. and head of the state bank. In 1934 he was elected a member of the central committee, but he was appointed a substitute member of the Politburo only in 1946 and a full member in Feb. 1948. He first donned military uniform in Oct. 1941 as political commissar to G. K. Zhukov's army group. In 1944 his mission was to organize the so-called Polish Committee of National Liberation which he brought to Lublin as the Polish provisional government. On Dec. 22, 1944, he succeeded K. E. Voroshilov as deputy commissar of the Soviet armed forces. He was appointed a deputy chairman of the Soviet council of ministers on March 19, 1946, and on March 3, 1947, as a marshal of the Soviet Union, he succeeded J. V. Stalin as minister of the armed forces. On March 24, 1949, he was relieved of the latter duties, becoming the chief inspector of the Soviet satellite armies.

PREMIER BULGANIN (left) offering a toast at a garden party given for U.S. air force chief of staff Gen. Nathan F. Twining (right) and other members of a U.S. military mission which visited the U.S.S.R. in 1956

In March 6, 1953, after Stalin's death, he was appointed one of the four deputy chairmen of the council of ministers and minister of the armed forces. When G. M. Malenkov resigned as chairman of the Soviet council of ministers on Feb. 8, 1955, Bulganin succeeded him.

During April 18–28, 1956, with N. S. Khrushchev, he paid an official visit to the United Kingdom. On Oct. 17 he sent a message to Pres. Dwight D. Eisenhower concerning the tests of atomic weapons. On Oct. 19, in Moscow, together with Ichiro Matsuyama, the Japanese premier, he signed a declaration terminating the state of war between the U.S.S.R. and Japan. On Nov. 1 he wrote to Eisenhower concerning the Suez crisis. In almost identical notes sent on Nov. 5 to Sir Anthony Eden and Guy Mollet, he spoke of Soviet willingness to "crush the aggressors."

Bulgaria. A people's republic in the eastern part of the Balkan peninsula, Bulgaria is bounded north by Rumania, west by Yugoslavia, south by Greece and east by Turkey and the Black sea. Area 42,796 sq. mi. Pop.: (1946 census) 7,022,796; (1955 est.) 7,548,000. Language (1947 est.): Bulgarian 85%; Turkish 9.8%. Religion (1947 est.): Greek Orthodox 75%; Moslem 11.5% (of which one-sixth Pomaks, or Moslem Bulgars, remainder Turks); Roman Catholic 0.9%; Gregorian Armenian 0.4%; Jewish 0.3%; Protestant 0.2%. Chief towns (1946 census; 1953 est. in parentheses): Sofia (cap.) 434,798 (600,000); Plovdiv 125,440 (150,000); Varna (1947 est.) 279,792; Russe 53,420; Burgas 43,684; Dimitrovgrad (1955 est.) 100,000. First secretary of the Bulgarian Communist party, Todor Zhivkov; chairman of the presidium of the national assembly, Gen. Georgi Damianov; chairmen of the council of ministers in 1956: Vlko Chervenkov and (from April 17) Anton Yugov.

History.—The main feature of the year 1956 was the reaction of the leadership of the Communist party to the Soviet denunciation of Stalin and the upheavals which followed in eastern Europe. In the case of Bulgaria the reaction was closely linked with Bulgarian-Yugoslav relations, and the bitter mistrust of Marshal Tito for the Bulgarian Communist leader, Vlko Chervenkov. In the eyes of the Yugoslav government, Chervenkov embodied the Stalinist method of domination in the people's democracies, and was also regarded as a traitor to Yugoslav-Bulgarian friendship.

In April the first public attacks on Chervenkov in Bulgaria appeared, and they were followed by a special plenary session of the central committee at which Chervenkov's removal from the premiership was decided upon, on the grounds of the damage which his devotion to the "cult of personality" had done to the country. The formalities of his resignation and of the election of his successor, the former Communist minister of the interior, Anton Yugov, were completed at a special session of the national assembly on April 16. Chervenkov remained in the government as a deputy premier. At the same time, a commission was set up to examine the case of the former Communist leader, Micho Kostov, who had been executed in 1949 for Titoism. On Oct. 18 the commission reported that Kostov had been sentenced on false evidence, and the government ordered his posthumous rehabilitation.

The Bulgarian people reacted to the change of prime ministers with mixed feelings. Some believed that it had come about at the instigation of Marshal Tito, while others felt that the change had not altered the Stalinist complexion of the party leadership. A number of Communist intellectuals called for greater freedom of the press and a revision of party policy in agriculture and industry. At this the government took fright and took punitive action against those who put forward such demands. An article in the party organ *Rabotnichesko Delo* on Sept. 22 maintained that under no circumstances must hostile criticism

be tolerated, because it was directed against the state. The same determination not to allow any relaxations of its dictatorship was in evidence throughout the Polish and Hungarian disturbances. It was clear that the policy of the Bulgarian Communist party was to rely on such methods rather than risk political upheavals through liberalization.

In agriculture, the government continued the rapid collectivization of the land. On Sept. 9 it was announced that 88% of all peasants had joined the farms, bringing with them 77% of the country's arable land.

The city of Varna, renamed Stalin, reassumed its ancient name. (M. MACK.)

Education.—Schools (1953): nursery 5,919, pupils 264,892; (1950) primary 6,112, pupils 755,628, teachers 18,801; higher primary 2,960, pupils 308,160, teachers 12,636; secondary 218, pupils 112,633, teachers 4,624; (1952) vocational, pupils 67,679; institutions of higher education (1956) 22, students 33,000, teaching staff 2,800.

Finance.—Budget (1956 est.): revenue 18,474,400,000 leva; expenditure 17,574,400,000 leva. Monetary unit: lev (pl. leva) with an official exchange rate, high and fictitious, of 6.80 leva to the U.S. \$1.

Foreign Trade.—(UN Economic Commission for Europe's estimates, in U.S. dollars, 1954.) Trade turnover with all countries \$410,000,000, including \$370,000,000 with the countries of the Communist group.

Transport and Communications.—Highways (1955) 13,780 mi. Licensed motor vehicles (Dec. 1955): cars 5,000, commercial 11,200. Railways (1952): 2,670 mi. Telephones (1954 est.): 61,000; radio receiving sets (1952) about 300,000, including 78,000 community loud speakers.

Agriculture.—Main crops (metric tons, 1934–38 average; 1948–50 in parentheses): wheat 1,690,000 (1,503,000); maize 913,000 (890,000); barley 365,000 (249,000); rye 264,000 (170,000); oats 122,000 (97,000); potatoes 109,000; tobacco 31,200 (20,000); sugar, raw 18,000 (58,000). Wine production (1938; 1949 in parentheses): 2,373,000 (426,000) hl. Livestock (1939; 1953 est. in parentheses): sheep and goats 11,000,000 (8,400,000); cattle 1,640,000 (1,700,000); pigs 1,084,000 (2,074,000); horses 584,000 (460,000). Wool production, greasy basis (1934–38; 1951 in parentheses): 9,600 (12,700).

Industry.—Production (metric tons if not otherwise stated, 1938; 1955 est. in parentheses): coal 146,000 (400,000); lignite 1,942,000 (9,900,000); electricity 202,000,000 (2,100,000,000) kw.hr.; steel (1955) 200,000; cement 194,000 (825,000); sulphuric acid 6,900 (32,400); cotton fabrics 33,000,000 (139,000,000) metres.

Burke, Arleigh Albert (1901–), U.S. naval officer, was born Oct. 19 at Boulder, Colo., and was graduated from the U.S. naval academy at Annapolis, Md., in 1923, later taking an M.S. degree from the University of Michigan, Ann Arbor. As an ensign he served aboard the U.S. battleship "Arizona." Placed in command of a destroyer division and later a destroyer squadron in 1943, he earned the nickname of "31-Knot Burke" because of his swift and hard-hitting destroyer attacks on the Japanese fleet and merchant marine in the Pacific during World War II. After the war he was leader of the so-called "admirals' revolt" against unification of the U.S. armed forces; at the same time he opposed the air force's advocacy of B-36 long-range atomic bombers as the key to U.S. strategic offense and proposed instead the construction of a fleet of supercarriers by the navy. Burke was advanced to the rank of rear admiral in June 1950, serving thereafter in the Korean war. At the time of his appointment on May 25, 1955, by Pres. Dwight D. Eisenhower as chief of naval operations, Burke was commander of the U.S. navy's Atlantic destroyer staff and 93rd on the list of ranking naval line officers. His appointment to succeed Adm. Robert B. Carney was effective Aug. 16, 1955, with the rank of full admiral.

In July 1956 Burke was reported to have disagreed with a plan attributed to Adm. Arthur W. Radford (*q.v.*), chairman of the U.S. joint chiefs of staff, to reduce U.S. armed forces personnel by 800,000 before 1961.

Burma. An independent federal republic on the eastern side of the Bay of Bengal, Burma lies between Pakistan and India on the northwest, Tibet on the north and China, Laos and Thailand (Siam) on the east. The republic comprises Burma proper, the Karen, Shan, Kachin and Kayah states, and the Chin special division. Area: 261,757 sq. mi. Pop.: (1941 census) 16,823,798; (1955 est.) 19,434,000. Racially, the peoples of Burma

are Mongoloid. Religion: Buddhist (90%). Language: Burmese (66%). Largest indigenous minorities: Karens, Shans, Kachins, Chins, etc. Largest immigrant minorities (1955 est.): Indian 600,000, divided equally between Moslems and Hindus; Chinese 350,000. Chief towns (pop., 1953 preliminary census): Rangoon (cap.) 711,520; Mandalay 182,367; Moulmein 101,720. President of the republic, Ba U; prime ministers in 1956: Nu and (from June 12) Ba Swe.

History.—The Karen and communist rebellions continued throughout 1956. The amnesty offer made in Oct. 1955 expired in April and it was estimated that 3,000 Karens and 5,000 communists then remained under arms. About 3,000 Chinese nationalists were also thought to be living in scattered groups along the Burma-Thailand frontier, but they were relatively quiescent.

The chamber of deputies was dissolved by the president as from March 1 and elections were held on April 27. Voting for the 125 seats in the upper house started on May 22, but was delayed in some constituencies because of security and other difficulties. A number of the 250 seats in the lower house were also left unfilled for the same reasons; of the 233 results announced by the middle of May, the governing group, the Anti-Fascist People's Freedom (Socialist) league, had secured 144 seats and its allies 25, while the principal opposition group, the Burma National United Front, secured 46. The B.N.U.F. claimed that it supported A.F.P.F.L. policy generally, but disagreed with it on policy toward the rebellion; it supported a negotiated settlement and the readmission of the Communist party into political life.

The relative success of the B.N.U.F. provoked some alarm in the A.F.P.F.L., and Nu, the prime minister, resigned, ostensibly to devote his energies to revivifying the A.F.P.F.L. of which he was president, though he later expressed his intention of resigning this position at the league congress in Jan. 1957. On June 12 he was succeeded by Ba Swe. It was suggested that Nu would return to office after a year, and he continued to play an important part in the conduct of government business, especially foreign affairs.

The two principal economic problems faced by the government were the advantageous disposal of rice exports and the control of inflation.

In order to dispose of its rice Burma undertook a number of

barter agreements with communist countries. The goods sent in return were not always those required by Burma, or were of bad quality, or arrived in embarrassing quantity. As a result, by the summer, when inquiries for rice for cash were coming in from other customers, the barter deals had become something of an embarrassment to Burma. The textile position was improved by a series of deals with Japan, India, the German Federal Republic and Great Britain for the supply of textiles against raw cotton made available to Burma by the United States for Burmese currency. In addition to barter agreements with eastern European countries, an agreement with India, under which the latter was to purchase 2,000,000 tons of rice over five years, was announced on May 23. The agreement, which aimed at balancing trade between the two countries, was signed on Sept. 5. On May 4 the government secured two loans totalling \$19,350,000 from the International Bank for Reconstruction and Development and on Sept. 25 decided to accept a loan of \$25,000,000 for economic development from the United States.

Burma's relations with China were overshadowed by reports during the summer of incursions by Chinese troops into the Wa area and the Kachin state in northern Burma. A joint communiqué issued on Nov. 9 and a statement by Nu on Nov. 10 made it clear that, in return for a withdrawal of Chinese troops behind the boundary fixed in 1941 in the Wa area, the Burmese would have to surrender the Namwan assigned tract, a narrow wedge of territory running into Burma hitherto held on perpetual lease from China, and also three areas commanding passes from China in the Kachin state. During negotiations on this issue Nu visited China at the end of October and Chou En-lai, the Chinese prime minister, visited Burma during December. (A. S. B. O.)

Education.—Schools (state only, March 1955): primary 8,951, pupils 1,096,000, teachers (1954-55) 23,337; secondary and middle 625, pupils 146,200, teachers (1954-55) 4,660. Pupils in private schools (1954) 82,200. Vocational schools and institutes 8 (including 3 artisan training centres with 2,235 pupils). Teacher training institutes (1955-56) 4, students 1,570. University of Rangoon (including intermediate colleges and branches) medical college, Mandalay, students (1955) 9,000.

Finance and Banking.—Monetary unit: kyat with an average exchange rate of 4.776 to the U.S. dollar in 1955 and 4.75 in Feb. 1956. Budget (1953-54 actual) revenue 996,000,000 kyats, expenditure (current) 756,000,000 kyats, (capital) 544,000,000 kyats; (1956-57 est.) revenue 891,000,000 kyats, expenditure 877,000,000 kyats. Currency circulation (Dec. 1954) 574,800,000 kyats, (Aug. 1955) 701,600,000 kyats. Deposit money (Dec. 1954) 284,400,000 kyats, (Dec. 1955) 398,500,000 kyats. Gold and foreign exchange holdings (Dec. 1954) U.S. \$142,400,000, (Dec. 1955) U.S. \$116,400,000.

Foreign Trade.—(1955): Imports 856,500,000 kyats; exports 1,079,400,000 kyats. Main sources of imports (1955): India 18%; U.K. 26%; other sterling area 8%; continental E.P.U. (European Payments Union countries) 16%; Japan 21%; U.S. and Canada 3%. Main destinations of exports (1955): India 18%; Japan 18%; Ceylon 7%; Indonesia 5%; U.K. 9%; other sterling area 14%. Chief exports (1955): rice 76%; teak 2%; cotton 4%.

Transport and Communications.—Roads (1954): 40,792 km. Motor vehicles in use (1954): passenger 12,900; commercial 11,400. Railways (1955) 2,900 km.; passenger-km. (Sept. 1953-54) 701,000,000; freight ton-km. (Sept. 1954-55) 606,000,000. Telephones (Jan. 1955) 7,200. Radio sets (1952) 15,000.

Agriculture.—Main crops (metric tons, 1955; 1954 in parentheses): rice 6,509,000 (5,804,000); rubber (exports) 10,400 (12,400); sesame 44,800 (36,400); peanuts 208,000 (156,000); cottonseed 39,000 (35,000); cotton, lint 20,000 (18,000); tobacco (1954) 48,300 (47,800 in 1953); sugar, raw value (1954) 23,000 (25,000 in 1953); dry beans (in 1953) 115,000. Livestock (excluding Shan and Kayah states, March 1954): oxen 4,731,000; sheep 33,000; buffaloes 826,000; pigs 480,000; goats 222,000. Timber (round logs, 1955-56): 706,230 cu. tons (including 162,301 cu. tons of teak).

Industry.—Electricity consumption (Rangoon area, 1954) 48,756,000 kw.hr. Production (metric tons, 1955): tin concentrates (metal content) 960; crude oil 199,200; cement (1954) 58,900; other minerals (metal content, 1954), lead 22,900, zinc (April 1953-54) 11,500, tungsten 450, silver (1953) 20,900.

Business Review. Sparked by the continued high level of federal government spending for national defense, the unprecedented expansion in business investment for new plants and equipment, and the high and rising volume of consumer demand backed by a high and rising volume

"THE CHINESE CULTURAL MISSION IS COMING," a 1956 cartoon from Hanthawaddy, a Burmese newspaper in Rangoon

GULFGATE SHOPPING CITY, outside Houston, Texas, a \$32,000,000 shopping centre, largest in the south, opened Sept. 20, 1956

disposable personal income augmented by further expansion in consumer credit, the economy of the United States expanded broadly in 1956. New all-time high levels of activity were recorded in almost every sector of the economy except agriculture, which continued to be depressed for the fifth consecutive year.

The upturn in business activity which began in the fourth quarter of 1954 as readjustments to the changes in demand incident to the cessation of the Korean war were completed, continued without interruption and at an accelerated rate throughout 1955. During the first three quarters of 1956, the high levels of economic activity reached in the fourth quarter of 1955 were maintained, and in many sectors of the economy new all-time high levels were reached. Reflecting the accelerated rate of expansion in the economy and, in part, feeding it, disposable personal income increased rapidly through the first three quarters of 1956, and in the third quarter was at an all-time high seasonally adjusted annual rate of \$288,800,000,000.

Production of consumer goods tended to keep pace with rising consumer demand during the first four months of the year with the result that retail prices remained relatively unchanged at the 1955 level through April. From May through July food prices increased substantially, and prices of apparel and rents moved upward. The pressure of expanding demand on supply, however, was reflected in the behaviour of wholesale commodity prices other than farm products and foods which rose sharply during the last two quarters of 1955, and continued to rise with only minor interruptions through the first three quarters of 1956. Wholesale prices of farm products and processed foods also made net gains.

Heavy demands for funds by business concerns during the first three quarters of the year resulted in a sharp increase in business loans at commercial banks, and in meeting this strong private demand for loans banks continued to sell United States government securities in large volume. Interest rates rose in March and April reflecting the strong demand for credit and the pressure on commercial bank reserves. Following advances in market rates of interest federal reserve credit policy shifted in late 1955 and in 1956 from a position of ease to restraint in inflationary pressures, and discount rates at federal reserve banks were raised from 1.5% to 3.0%.

National Product.—The gross national product or expenditure representing the total of personal consumption expenditures, gross private domestic investment, net foreign investment, and total federal, state and local government expenditures rose

steadily throughout the four quarter period ending with the third quarter of 1956. In the third quarter of 1956, the gross national product as reported by the department of commerce was at a seasonally adjusted annual rate of \$413,000,000,000, a new all-time high. This high annual rate in the third quarter of the year represented an increase of \$16,200,000,000 in annual rate from the third quarter of 1955, and of \$9,600,000,000 from the first quarter of 1956.

In the third quarter of 1956, the department of commerce reported personal consumption expenditures at a seasonally adjusted annual rate of \$267,000,000,000, an increase of \$9,200,000,000 from the third quarter in 1955, and of \$5,300,000,000 from the first quarter of 1956. Gross private domestic investment after reaching a new high annual rate of \$65,100,000,000 in the last quarter of 1955 dropped to \$63,100,000,000 in the first quarter of 1956, but was stepped up to \$64,200,000,000 in the second quarter where it remained substantially unchanged through the third quarter of the year, at a rate \$1,700,000,000 above the third quarter of 1955.

The decline in the annual rate of gross private domestic investment in the first quarter of 1956 was due primarily to the sharp drop from the fourth quarter of 1955 in business inventories, which continued to decline sharply through the second and third quarters of the year, reaching a low annual rate of \$1,000,000,000 in the third quarter of 1956, a drop in annual rate of \$5,100,000,000 from the high rate of \$6,100,000,000 in the fourth quarter of 1955. Private domestic investment other than in business inventories, that is, fixed investment in new constructions and producers' durable equipment, mounted steadily throughout the first three quarters of 1956, and the annual rate of \$63,000,000,000 reported by the department of commerce in the third quarter of the year represented a gain in annual rate of \$4,500,000,000 from the third quarter in 1955, and of \$4,000,000,000 from the first quarter of the year.

During the last three quarters of 1955, the annual rate of government expenditures, federal, state and local, for goods and services crept up gradually, and the third quarter annual rate of \$78,100,000,000 was an increase of \$1,600,000,000 from the second quarter of 1955. During the first three quarters of 1956, the gradual uptrend was continued and in the third quarter of the year reached \$80,300,000,000, of which \$33,100,000,000 represented state and local government expenditures, and \$47,-

200,000,000, federal government expenditures.

National Income.—The upward trend in the national income, or purchasing power distributed through the economy, which began in the fourth quarter of 1954 continued sharply upward throughout 1955, and through the first two quarters of 1956. At an annual rate of \$338,700,000,000 in the second quarter of 1956, the total was \$3,800,000,000 above the first quarter of the year, \$4,300,000,000 above the fourth quarter of 1955, and \$16,800,000,000 above the corresponding quarter in 1955.

The income flow to employees, as reported by the department of commerce, after reaching a new high seasonally adjusted annual rate of \$230,300,000,000 in the fourth quarter of 1955, continued to increase throughout the first three quarters of 1956, and in the third quarter was at an annual rate of \$240,400,000,000, a gain in rate of \$7,400,000,000 from the first quarter of the year, and of \$13,600,000,000 from the third quarter of 1955.

Corporate profits before tax and after inventory valuation adjustments increased steadily throughout 1955, and in the fourth quarter of 1955 reached a new high annual rate of \$43,400,000,000. The seasonally adjusted annual rate for the year 1955 at \$40,900,000,000 was a new all-time high. During the first two quarters of 1956, the annual rate declined from the fourth-quarter 1955 high, but at an annual rate of \$40,900,000,000 in the first quarter of 1956, and of \$39,800,000,000 in the second quarter, compared favourably with the first two quarters of 1955.

Proprietors' income in business and the professions increased steadily throughout the four quarters of 1955 and continued to increase through the first three quarters of 1956, reaching a new high annual rate of \$29,500,000,000 in the third quarter of 1956. Rental income of persons dropped slowly throughout 1955 to an annual rate of \$9,800,000,000 in the fourth quarter of 1955 and remained at substantially the same rate during the first three quarters of 1956. Net income from interest rose continuously throughout 1955 and continued to increase through the third quarter of 1956 when the seasonally adjusted annual rate reported by the department of commerce was \$12,000,000,000.

The decline in proprietors' income from farming, which had been in process with only minor interruptions since the fourth quarter of 1951, continued through the first two quarters of 1956 and was only slightly reversed in the third quarter when the preliminary estimate by the Council of Economic Advisers of \$11,600,000,000 in the seasonally adjusted annual rate indicated an increase of \$300,000,000 from the second quarter of 1956 and from the third quarter of 1955. The average annual rate for the first three quarters of 1956 at \$11,500,000,000 was

\$300,000,000 below the average rate for the same period in 1955, and \$4,600,000,000 below the average rate for 1951. (See also INCOME AND PRODUCT, U.S.)

Personal Income, Spending and Savings.—Disposable personal income, that is, personal income after personal taxes, increased markedly after the first quarter of 1955, reflecting the expansion in all segments of the economy except agriculture, and continued to increase during the first three quarters of 1956. Disposable personal income in the third quarter of 1956, according to the preliminary estimate of the Council of Economic Advisers, was at a seasonally adjusted annual rate of \$288,300,000,000, an increase in annual rate of \$8,100,000,000 from the first quarter of 1956, and of \$14,500,000,000 from the third quarter in 1955.

Personal consumption expenditures, reflecting the rapid and substantial rise in disposable personal income, also increased substantially and steadily throughout 1955 and through the first three quarters of 1956. In the third quarter of 1956, the Council of Economic Advisers estimated personal consumption expenditures at a seasonally adjusted annual rate of \$267,000,000,000, an increase of \$5,300,000,000 from the first quarter of 1956, and of \$15,200,000,000 from the third quarter of 1955.

Personal savings paralleled the increase in personal expenditures throughout 1955 and the first three quarters of 1956, increasing from an annual rate of \$13,900,000,000 or 5.3% of disposable personal income in the first quarter of 1955 to \$21,300,000,000 or 7.4% of disposable personal income in the third quarter of 1956.

Total personal income flow before taxes in the third quarter of 1956 was estimated by the Council of Economic Advisers at an annual rate of \$327,100,000,000, an increase in rate of \$12,500,000,000 from the fourth quarter in 1955. Personal taxes in the third quarter of 1956 were estimated at an annual rate of \$38,800,000,000, an increase in rate of \$2,500,000,000 from the fourth quarter in 1955. Thus, disposable personal income was expanded by approximately \$10,000,000,000 during this four-quarter period ending with the third quarter of 1956.

Government Expenditures.—Federal, state and local government expenditures for goods and services during the first three quarters of 1956 were slightly greater than in the corresponding quarters in 1955, due primarily to some expansion in state and local government expenditures; federal government expenditures during the first two quarters of 1956 were slightly lower than in the corresponding quarters of 1955, and in the third quarter were only slightly above the third quarter of 1955. The department of commerce estimated the annual rate of government expenditures in the third quarter of 1956 at \$80,300,000,000, of

U.S. SALES AND INVENTORIES, 1955-Aug. 1956. Source: U.S. department of commerce

nich \$47,200,000,000 represented federal government expenditures and \$33,100,000,000 represented state and local government expenditures. Of the federal government total of \$47,200,000,000, expenditures for national security accounted for \$41,700,000,000 or 88.3% of total federal expenditures. During the first three quarters of 1956, federal government expenditures for national security increased by \$1,200,000,000 while expenditures for other federal functions declined by \$400,000,000. (See also BUDGET, NATIONAL.)

Industrial Production.—Industrial production as measured by the federal reserve board index rose sharply and continuously throughout 1955 from the low point in mid 1954, and by Dec. 1955 had climbed to a new high of 144% of the 1947-49 average. During the first quarter of 1956, production declined from the December high and in March 1956 the index had dropped to 141%, a decline of 3 percentage points. There was an upturn to 143% in April, but in May and June the index fell again to 141%, and, reflecting the effects of the steel strike, dropped in July to 136%. With the settlement of the steel strike, production rebounded rapidly in August and September, and at 144% in September had regained the previous high peak reached in Dec. 1955. Although production in both the durable- and the nondurable-goods industries slackened and declined during the first two quarters of 1956, the drop was more pronounced in the durable-goods industries which also were more seriously affected by the midsummer steel strike. During the first seven months of the year ending in July 1956, the durable-goods index dropped 13 points, from 160% of the 1947-49 average to 147%. During the same seven-month period, the nondurable-goods index dropped only 6 points, from 129% of the 1947-49 average to 127%.

Employment.—Total employment dropped sharply during the first two months of 1955, and continued to drift lower during the next two months of 1956, but in March the downward trend was reversed and employment increased steadily and rapidly through August with only a slight drop in September. At the low point in February, the department of labour reported employment at 65,576,000 and unemployment at 2,914,000 or 4.4% of the civilian labour force. By August, employment had climbed to a new all-time high of 66,752,000 and unemployment had dropped to 2,195,000 or 3.2% of the civilian labour force. Because of the reduction after July in the number of persons in the civilian labour force, unemployment continued to decline through September in spite of the drop in the number employed. Unemployment in September had dropped to 1,998,000, or only 2.9% of the labour force. (See also EMPLOYMENT.)

Wages and Hours.—Average hourly earnings of production-related workers in manufacturing continued to creep upward during the fourth quarter of 1955 and throughout the first three quarters of 1956, and in Sept. 1956 were reported by the department of labour at \$2.00 per hour. The September hourly rate in the durable-goods industries was 31 cents greater than in the nondurable-goods industries, the hourly rate in the former averaging \$2.13, and in the latter, \$1.82. Hourly rates in building construction were substantially higher than in manufacturing, averaging around \$2.75 per hour during the first two quarters of the year, and in retail trade were substantially lower than in manufacturing, averaging around \$1.55 per hour during the first two quarters of the year. Average hours worked per week in manufacturing during the first three quarters of the year were down about 1 hour per week from the fourth quarter of 1955 with the durable-goods industries averaging slightly more than 40 hours per week, and the nondurable-goods industries, only more than 39 hours. Hours of work per week in building construction increased during the first three quarters of the year and the August average of 37.2 hours was an increase of 1.5 hours from the January average of 35.1 hours.

Preliminary estimates by the department of labour for August and September indicated a slight increase from previous months with average weekly earnings in September at \$81.00 per week, about 30 cents per week higher than the Dec. 1955 average. Weekly earnings in Sept. 1956 averaged \$87.54 in the durable-goods industries, an increase of \$2.64 per week from January and of \$2.88 per week from Sept. 1955. In the nondurable-goods industries, the September average was \$72.25, an increase of \$2.42 from January and of \$3.28 from Sept. 1955. Weekly earnings in building construction in Aug. 1956 averaged \$104.53, a gain of \$8.36 per week from January and of \$6.50 from Aug. 1955. Weekly earnings in retail trade in August at \$61.78 were up \$2.34 per week from January and \$1.59 from Aug. 1955. (See also WAGES AND HOURS.)

Prices.—Commodity prices at wholesale rose sharply during the first three quarters of 1956, reversing the relatively stable trend which had prevailed from Jan. 1953 until the fourth quarter of 1955. The department of labour's all-commodity wholesale price index in Sept. 1956 had advanced to 115.3% of the 1947-49 average, an increase of 3.4 points from Jan. 1956, and of 3.6 points from Sept. 1955. All components of the all-commodity index including farm products and processed foods participated in the upward trend in wholesale prices during the first five months of the year, and the June and July dip in prices was experienced by all components although in varying degrees as was also the slight upturn in September. Although the trends in the major components of the all-commodity index were in the same general direction and generally upward during the first three quarters of 1956, the disparity between the prices of farm products and processed foods and the prices of commodities other than farm products and foods which began early in 1951 and had continued for the past five years was not materially lessened. The parity ratio for farm prices, that is, the ratio of the index of prices received by farmers to the parity index based on average prices in the period 1910-14 dropped to 80 in Dec. 1955, rose gradually to 86 in June, declined to 82 in August, where it remained in September. The September parity ratio of 82 was 25 points below the average for the year 1951 when the parity ratio stood at 107.

The all-items consumer price index in August at 116.8% of the 1947-49 average was 2.2 points above Jan. 1956, and 2.3 points above Aug. 1955. The index of retail food prices in August at 113.1 was up 3.9 points from January, and the index of apparel prices at 105.5 was up 1.4 points from January. (See also PRICES.)

New Plant and Equipment.—Business expenditures on plant and equipment increased sharply throughout 1955. The July-August survey of business expenditures on plant and equipment made by the Securities and Exchange commission and the department of commerce indicated a continued increase in expenditures through the second half of 1956 of such magnitude as to raise the annual rate in the fourth quarter of the year to \$38,000,000,000 and bringing the expected total for the year 1956 to \$35,300,000,000, an increase of \$6,600,000,000 over the expenditures in 1955.

For the year 1956, manufacturing expenditures were estimated by the department of commerce at a new high total of \$15,250,000,000, an increase of \$3,810,000,000 from 1955 expenditures. The 1956 outlay for new plant and equipment in the manufacturing industries was about equally divided between the durable- and the nondurable-goods industries, the estimated total for the durable-goods industries being \$7,720,000,000, and for the nondurable-goods industries, \$7,530,000,000. Commercial expenditures for new plant and equipment in 1956 were estimated at \$10,710,000,000, an increase of \$1,240,000,000 from 1955; railroad expenditures at \$1,320,000,000, an increase of \$400,000,000;

public works and utilities expenditures at \$5,010,000,000, an increase of \$700,000,000; and mining expenditures at \$1,240,000,000, an increase of \$280,000,000.

Construction.—Expenditures for new construction reached a new high level in 1955 and were reported by the department of commerce at \$43,000,000,000 for the year, an increase of \$5,200,000,000 from 1954. During the first three quarters of 1956, construction expenditures continued to edge up gradually from the new high 1955 level, and in each of the three months of the third quarter of 1956 were at a seasonally adjusted annual rate of \$44,500,000,000, an increase in rate of \$1,500,000,000 from the 1955 level.

Private construction—residential nonfarm and business construction—continued to constitute about 70% of the total, and federal, state and local government, the remainder. In Sept. 1956, the department of commerce reported expenditures for private, nonfarm residential building at a seasonally adjusted annual rate of \$15,400,000,000, the same rate as prevailed in Jan. 1956 and in the intervening months but \$1,700,000,000 below the Sept. 1955 rate. Business expenditures in Sept. 1956 were at an annual rate of \$15,700,000,000, an increase in rate of \$1,100,000,000 from Jan. 1956, and of \$1,200,000,000 from Sept. 1955. Public construction, federal, state and local government construction, fluctuated around \$13,000,000,000 throughout the first three quarters of 1956, and at an annual rate of \$13,400,000,000 in September was \$1,000,000,000 above the 1955 rate. (See also ARCHITECTURE; BUILDING AND CONSTRUCTION INDUSTRY; HOUSING.)

Consumer Credit.—Consumer credit expanded continuously and rapidly throughout 1955 after a slight decline in January and February, and in December reached a new all-time high at \$36,-

225,000,000, an increase of \$6,100,000,000 from Dec. 1954. After a slight drop in January and February of 1956, the uptrend was resumed and continued through August when the amount outstanding was reported by the board of governors of the federal reserve system at \$37,503,000,000, an increase of \$1,904,000,000 from Jan. 1954, of \$3,867,000,000 from Aug. 1955, and of \$1,278,000,000 from Dec. 1955, the previous all-time high. Of the total consumer credit outstanding in Aug. 1956, 78% was installment credit which at \$29,427,000,000 was \$1,658,000,000 greater than in Jan. 1956, and \$3,272,000,000 greater than in Aug. 1955. Of the installment credit outstanding in Aug. 1956, 52.2% was automobile paper which at \$15,361,000,000 was \$1,047,000,000 greater than in Jan. 1956, and \$1,814,000,000 above Aug. 1955. Other consumer-goods paper, constituting about 17.5% of total installment credit outstanding, fluctuated around \$6,000,000,000 during the first eight months of 1956, and at \$6,319,000,000 in Aug. 1956 was \$557,000,000 greater than in Aug. 1955. Personal loans also increased steadily throughout the first eight months of 1956, and the amount outstanding in Aug. 1956 at \$6,052,000,000 was \$525,000,000 above Jan. 1956, and \$795,000,000 above Aug. 1955. Loans for repair and modernization fluctuated around \$1,600,000,000 during the first eight months of 1956, little changed from the 1955 average. (See also CONSUMER CREDIT; FEDERAL RESERVE SYSTEM.)

Commercial Bank Loans and Investments.—Commercial bank loans at the end of Aug. 1956 as reported by the board of governors of the federal reserve system were at a record high of \$87,600,000,000, an increase of \$5,600,000,000 from Jan. 1956, and of \$9,200,000,000 from Aug. 1955. The sharp downward trend in commercial bank investments in United States government securities which began early in 1955 was continued through

July 1956 with some increase in such investments in August. At the low point of the decline in July 1956, commercial bank holdings of government securities as of the end of the month at \$55,900,000,000 were down \$5,000,000,000 from Jan. 1956. At the end of Aug. 1956 after a \$1,000,000,000 increase from July, commercial bank holdings of government securities were \$4,000,000,000 below Jan. 1956, and \$5,600,000,000 below Aug. 1955. Commercial bank investments in securities other than government securities remained relatively unchanged through the first eight months of 1956 at around \$16,500,000,000, substantially the same level as was maintained throughout 1955.

Sales and Inventories.—Seasonally adjusted manufacturers' sales in Aug. 1956 were reported by the department of commerce at \$27,500,000,000, a gain of \$500,000,000 from Jan. 1956 and only \$300,000,000 from Aug. 1955. Manufacturing inventories in Aug. 1956 at \$49,400,000,000 were \$3,100,000,000 above Jan. 1956, and \$5,100,000,000 above Aug. 1955.

During the first eight months of 1956 wholesale sales fluctuated from \$10,300,000,000 in January and March to \$10,700,000,000 in August when they were \$800,000,000 above Aug. 1955. Wholesale inventories were also relatively stable throughout the first eight months of 1956, fluctuating between \$12,400,000,000 in January and \$12,800,000,000 in July and August, with August inventories \$800,000,000 above Aug. 1955. Retail sales during the first eight months of the year edged up slightly from the high levels established in the last half of 1955 after minor fluctuations up and down during the first four months of the year. They declined slightly in September when they were reported by the department of commerce at \$15,900,000,000. Retail inventories after increasing sharply during the last two months of 1955 and the first two months of 1956 declined in March and leveled off through August at \$23,800,000,000.

Corporate Profits.—The department of commerce reported corporate profits after taxes at a seasonally adjusted annual rate of \$23,000,000,000 in Dec. 1955, an increase in annual rate of \$300,000,000 from the first quarter of the year. In the second quarter of 1956, the annual rate dropped to \$21,300,000,000, a drop of \$1,700,000,000 from the fourth quarter 1955 rate, but still \$1,000,000,000 greater than in the second quarter of 1955. At an annual rate of \$12,300,000,000 in the third quarter of 1956, dividend payments were \$500,000,000 above the first quarter of the year, and \$200,000,000 above Dec. 1955. Undistributed profits in the first two quarters of 1956, although below the last two quarters of 1955, were substantially the same as in the first two quarters of 1955 at around \$9,450,000,000. (V. B. B.)

Great Britain.—Unlike its predecessors in the prolonged boom, 1956 opened in Great Britain with the admission, official as well as private, that the economic position had gotten out of hand. Though the economic picture was tolerably clear, the correct remedy was politically difficult to apply. An essential aspect of the boom was that prices, and with them the cost of living, were rising. Rising prices, however, included the price of labour (wages), and moreover, they brought easy profits. Consequently the remedy calculated to arrest the rise in prices would throw on the government the odium of interfering with business, with a pay envelope and possibly with full employment.

The methods used to deal with this state of affairs were orthodox. On Feb. 16, the bank rate was raised to 5½% (the highest since Feb. 1932) and the following day Harold Macmillan, the chancellor of the exchequer, introduced a miscellaneous commandment dose of supporting remedies including a reduction in public expenditure, notably in the nationalized industries and food subsidies, and a reduction in the investment allowance in industry. These interim measures were followed by the budget, which recognized that further taxation as a deflationary instrument was out of the question. Its chief interest lay in a novelty,

the introduction of so-called "premium bonds" which were meant to stimulate savings by introducing an element of gambling in place of fixed interest. This measure was adopted in the face of fairly wide-spread criticism. The various devices introduced up to this point satisfied the government that it would be possible to keep prices steady for a year.

They were reinforced by a number of subsidiary savings in government expenditure announced on June 26, amounting to £76,000,000 in the year.

The difficulties of dealing with the problem of rising prices accompanied by a high domestic level of consumption, to the detriment of exports, and of capital formation, were illustrated about the middle of 1956 when the credit squeeze, coupled with restrictions on the purchase of cars and with internal readjustments, led to the dismissal of a number of employees in the motor industry. The largest single number was 6,000 men dismissed by the British Motor corporation. Strong feelings were aroused among the trade unions, and it looked as though a new situation had arisen. The natural outcome of government policy would have been to create a moderate pool of unemployed, having the dual purpose of reducing claims for higher wages and of facilitating the transfer of labour to areas where it would be most useful economically.

It now looked as though full employment would have to be maintained and the transfer of labour arranged through a more direct form of intervention.

On the whole, however, these different measures worked; the more effectively since the restrictions on instalment purchasing and the increases in purchase tax introduced in 1955 began to make themselves felt. The over-all result, which must have been expected by the authorities, was to place a brake on industrial production, which showed a tendency to level off instead of rising as it had done in previous years. But this average result concealed substantial differences in different industries. Production of radio and television sets and of electrical equipment, as well as of cars, fell substantially, whereas the production of steel expanded still further. The increase in the demand for machine tools was a good indication of the rate at which industry was re-equipping itself. This picture was confirmed by financial statistics. Deposits and advances at the clearing banks were lower, at least in the first six months of 1956. In other words, the brake was being effective and beginning to hold business back. The relevant figures for the bank clearing and for consumption seemed to indicate a relaxation in the spending spree and in the chase of money after goods. The resultant saving was reflected in a better balance of payments.

Until the Anglo-French intervention in Egypt in November the general economy was in a state of balance, albeit a precarious one. The immediate expenditure on these operations was not sufficient to cause a major disturbance in the budget: the chancellor of the exchequer stated that the extra expenditure until the end of the financial year would amount to no more than £50,000,000. The rest of the world passed its judgment by heavy withdrawals, with the result that the gold and dollar reserves were under severe pressure. Some people professed to believe that this strain would be no more than temporary. The first effect of the intervention in Egypt was a pronounced shortage of oil. This was mainly due to the fact that a given tonnage of shipping was required to carry oil over substantially larger distances than hitherto. But the question of finding dollars to pay for U.S. oil also rose, and in this respect it was noted with some alarm that the position of Great Britain was strikingly inferior to that, for example, of the German Federal Republic.

(W. H. JN.)

Butler, Paul Mulholland (1905-), U.S. political leader who as chairman of the Democratic national committee managed the campaign of the Democratic party in 1956, was born at South Bend, Ind., on June 15 and took his law degree from Notre Dame university in 1927. Even before setting up practice in his native town in 1927 he had entered politics as a Democratic precinct worker. He rose gradually in the ranks of Indiana politics, becoming national committeeman for the state in 1952. At the Democratic convention of 1952 in Chicago, Ill., Butler was one of Adlai E. Stevenson's principal supporters for the presidential nomination, and the following year he was named to the 11-member executive committee of the Democratic national committee. Butler was elected chairman of the national committee on Dec. 4, 1954, despite the opposition of former President Harry S. Truman, and he took office on Jan. 1, 1955. Almost immediately he began to attack the Eisenhower administration, concentrating on Vice-Pres. Richard M. Nixon, whom he accused of "smear tactics" during the 1952 and 1954 election campaigns. During 1956 Butler repeatedly criticized Pres. Dwight D. Eisenhower's decision to run for a second term despite his heart attack, declaring on one occasion that the president's re-election would mean "government by a shadowy regency acting in the president's name." Following the Democratic convention at Chicago in 1956 the Democratic national committee on Aug. 18 re-elected Butler chairman, after brief opposition from Adlai E. Stevenson.

Butter: see DAIRY PRODUCTS; VEGETABLE OILS AND ANIMAL FATS.

Byrd, Richard Evelyn (1888-), U.S. explorer and naval officer, was born at Winchester, Va., on Oct. 25. He was graduated from the U.S. naval academy at Annapolis, Md., in 1912, subsequently advancing to the rank of rear admiral, retired. An early naval pilot (1918), he was in command of U.S. naval air bases in Canada during the latter part of World War I. In 1925 he led the naval section of the Navy-MacMillan polar expedition. On May 9, 1926, he was co-pilot with Floyd Bennett on the first flight by man over the north pole. (Later, with three crewmen, he was first to fly over the south pole Nov. 29, 1929.)

On June 29-July 1, 1927, with three others, Byrd flew the Atlantic eastward from New York city. The plane was forced down near Ver-sur-Mer, Fr., after failure to land in Paris because of bad weather.

Byrd's greatest fame came as leader of a series of expeditions to the antarctic, in 1928-30, 1933-35, 1939-41 and 1946-47. During the first he established the Little America camp in the Ross sea. In the second he nearly lost his life when he wintered alone at a weather base for five months. The third expedition resulted in the most extensive exploration of the antarctic to that date. The fourth, in addition to gathering important scientific data, was undertaken to train military personnel for combat in polar regions. More than 1,000,000 sq.mi. of new territory were mapped during the four expeditions. (See also *Encyclopædia Britannica*.)

Byrd's fifth trip to the antarctic was announced in 1955. On March 28 he was appointed commander of an expedition to leave later that year as part of the United States participation in events of the International Geophysical year, 1957-58. The first section of the expedition sailed from Boston on Oct. 30, 1955. On Nov. 2 it was announced that Byrd had been placed in charge of the entire United States antarctic program. He left for the antarctic later that month, reaching Kainan bay, about 800 mi. from the south pole and near the Bay of Whales, on Dec. 28 and setting up the expedition's principal base there.

Calendar of Events, 1956: see pages 65-80.

California. Ranked second nationally in both area and population, California gained statehood on Sept. 9, 1850. Popularly called the "Golden state" because of the association of gold with its early development, California contains a total area of 158,693 sq.mi., including 1,953 sq.mi. of water area. It is the most southerly of the Pacific coast states. The July 1, 1956, population estimate of the state indicated 13,433,000 inhabitants (1950 census, 10,586,223). Chief cities (pop. 1956 estimate with 1950 figures in parentheses) were Los Angeles, 2,104,663 (1,970,358); San Francisco, 805,000 (775,357); San Diego, 466,000 (334,387); Oakland, 404,500 (384,575); Long Beach, 316,000 (250,767); Sacramento (the state capital), 158,747 (137,572); Fresno, 118,000 (91,669); Berkeley, 115,000 (113,805); Glendale, 114,753 (95,702); San Jose, 112,465 (95,280); Pasadena, 110,475 (104,577); Burbank, 96,890 (78,577).

History.—After charges and countercharges between Gov. Goodwin J. Knight and Treasurer Charles G. Johnson, and with the conduct of the treasurer's office under legislative investigation, Johnson retired during 1956. Governor Knight appointed A. Ronald Button to fill the unexpired term of Johnson, who had been in office since 1922. The other state officers remained: Harold J. Powers, lieutenant governor; Frank M. Jordan, secretary of state; Edmund G. (Pat) Brown, attorney general; Robert C. Kirkwood, controller; Roy E. Simpson, superintendent of public instruction.

Following the national pattern, California gave its electorally vote to Pres. Dwight D. Eisenhower in the 1956 elections. Locally the Democratic party again whittled away at the long-standing Republican supremacy in the state legislature to a point of equality in the state senate and near equality in the assembly. Three major bond issues passed by substantial majorities. The first provided for a \$500,000,000 extension of the California veterans' farm and home purchase program. The second measure, a \$100,000,000 issue, provided for school building and site purchases, and for facilities for educating physically handicapped and mentally retarded minors. The third bond issue, \$200,000,000, was to be used in the state building construction program with a minimum of \$60,000,000 designated for state colleges. The most heated local issue proved to be an abortive oil and gas conservation measure, with several million dollars being expended by both proponents and opponents of the measure.

The Christmas floods of 1955 proved to be the most disastrous in California's history. The inundation was widespread, including much of the Central valley and many of the coastal valleys, and cut north-south transportation arteries, bringing holiday travel to a standstill. Particularly hard hit was the Yuba City area, where the combined waters of the Feather and Yuba rivers broke the levee and caused considerable loss of life and property damage in the amount of approximately \$200,000,000. The winter floods combined with the perennial summer shortage of water gave additional impetus to demands for action on the \$1,500,000,000 Feather river project.

San Francisco bay's last automobile ferry ceased operation upon the opening of the double-decked Richmond-San Rafael bridge. Built at a cost of \$68,000,000, it was the world's second longest high-level crossing, reaching a length of 21,343 ft.

California played host to the Republican national convention which was held in the Cow Palace and brought 40,000 visitors to San Francisco. At approximately the same time San Francisco's famous Ferry building, after modernization, was opened as a world trade centre, providing offices for firms engaged in foreign trade and 60,000 sq.ft. of display space for foreign merchandises.

SMOKE PALL hanging over the hills in San Bernardino valley, Calif., on Sept. 24, 1956, the fifth day of an extensive forest fire. Thousands evacuated their homes as the blaze threatened the Lake Arrowhead resort area

Continued population growth in California magnified the inadequacy of school facilities and the teacher shortage. Subdivisions for residential purposes and acquisition of lands for highway development caused continued loss of productive agricultural land.

Education.—Average daily school attendance for budgetary purposes for 1954-55 was calculated at 1,738,531 for elementary school districts, at 125,197 for high school districts and at 117,376 for junior college districts.

Social Insurance and Assistance, Public Welfare and Related Programs.—As of June 1956 there were 264,276 recipients of old-age security payments, with average monthly aid being \$71.28 per person (June 1955, \$69.190 at \$67.60 per recipient). Aid to the needy blind program paid 15,547 persons average payments of \$88.37. Support was provided for 180,305 needy children with average monthly payments of \$47.26 to children in family groups, while general home relief was provided for 25,717 cases involving 44,856 persons.

For the month of Aug. 1956 the four California-administered social insurance programs compensated 76,868 unemployed or disabled claimants per week in a total amount of \$11,050,862 for the month. Total operating expenses for the state department of corrections for the year 1955-56 were estimated at \$24,336,247. Total population of California correctional institutions as of July 31, 1956, numbered 15,250, including 604 women. Estimates of youth authority institutions totalled 3,498 (as of July 31, 1956), of which 411 were in two schools for girls, 267 in three forestry camps for boys, 1,489 in four schools for boys and 667 in vocational institution; the remainder were in other institutions or prisons.

Communications.—Final automobile registrations for 1955 were 5,360,717. Estimated total expenditures by the state division of highways for reconditioning, resurfacing and construction of highways for 1955-56 were estimated at \$275,086,273, including \$44,015,074 in federal aid contributions (1954-55, \$251,075,534, including \$30,396,808 in federal assistance).

Figures compiled in 1950 indicated 7,518 mi. of steam and 702 mi. of electric railroads in California. As of Dec. 31, 1954, the state had 465 airports, including 205 public and 260 limited airports, with 8,367 planes based in California airports. As of 1955 there were 4,979,840 telephone stations within the state.

Banking and Finance.—Total assets of the 148 state-licensed savings and loan associations operating in California (as of Dec. 31, 1955) were \$1,185,162,847, while 66 federal savings and loan associations had assets of \$1,956,410,201 and total bank debits reached \$147,002,673,000. As of April 10, 1956, California's 89 federal reserve member banks had total assets of \$19,070,571,000.

Estimated total state revenue for 1955-56 was \$1,562,264,381 (1954-55, \$1,433,824,048), and estimated total expenditures were \$1,606,163,971 (1954-55, \$1,422,451,674). California's net bonded debt (outstanding Dec. 31, 1955) was \$785,355,680. Per capita income for 1955 was \$2,271 and per capita tax rate \$111.74, while state tax collections in 1955 amounted to \$1,480,010,000 (1954, \$1,299,714,000).

Agriculture.—California's gross cash farm income again led the nation in 1955, being \$2,632,650,000 (1954, \$2,518,384,000). Returns from livestock and poultry products aggregated \$951,373,000 (1954, \$904,810,000), and crop returns were \$1,681,277,000 (1954, \$1,613,574,000).

Manufacturing.—As of July 1956, 1,156,600 wage and salary workers are employed in California manufacturing industries. Approximately 11,200 were employed in production of nondurable goods and 765,400 in manufacture of durable goods. As of Aug. 1956 total civilian employment was 5,512,000, highest in state history, while unemployment figures showed 134,000 not working.

Preliminary estimates of 1955 retail trade indicated \$17,636,900,000 spent, marking an increase of 14.7% from the preceding year's total. Public and private construction figures were estimated at 16.7% higher than in 1954, or \$4,900,000,000.

(D. C. Cr.)

Mineral Production.—Table III shows the tonnage and value of minerals produced in California whose value exceeded \$100,000 in 1953 and 1954. In 1954 the state led all others in output of asphalt, borates, chromite, diatomite, pumice, sand and gravel, produced 61% of total mercury and a great part of iodine, was second in production of bromine, crude petroleum, potash and tungsten and in output of cement, but first in shipments of cement, third in china clay and fourth in output of gold and natural gas. The state ranked second in value of its minerals, with 10.25% of the U.S. total in 1954.

ENCYCLOPÆDIA BRITANNICA FILMS.—*California* (1955); *Far Western States* (1955); *Yosemite* (1954).

Cambodia. An independent kingdom situated in the southern part of the Indochinese peninsula, on both banks of the Mekong river, Cambodia is bounded west and north by Thailand, northeast by Laos, east and southeast by the National Republic of Vietnam and southwest by the Gulf of Siam. Area: 67,568 sq.mi. Pop. (1955 est.): 4,358,000. The Cambodians (87% of the total) are Thai-speaking Khmers. National minorities: Vietnamese and Chinese. Religion: Buddhist. Capital (pop., 1955 est.): Pnom-Penh 375,000. Ruler, King Norodom Suramarit; premiers during 1956, Norodom Sihanouk (to April 2 and from August until Oct. 15), Khim Tit (April 2 to July 29) and San Yun (from Oct. 25).

History.—The formal coronation of King Norodom Suramarit took place on March 5, 1956. His son, the former king, Norodom Sihanouk, resigned from his position as prime minister to travel abroad affirming Cambodian neutrality. The countries he visited

CORONATION of King Suramarit and Queen Kossamak of Cambodia on March 5, 1956, at Pnom-Penh, the nation's capital

from April through July included the Philippines, Communist China, Poland, France and the U.S.S.R.

Khim Tit, prime minister from April 2, resigned with his cabinet on July 29, and Sihanouk resumed the position temporarily. The national assembly approved San Yun as prime minister on Oct. 25.

On Dec. 15, 1955, Cambodia became a member of the United Nations. South Vietnam closed its border with Cambodia during March 1956, after a dispute over islands in the Gulf of Siam. On April 12 a trade agreement was concluded with Communist China, and on May 17, the U.S.S.R. recognized and exchanged ambassadors with the Cambodian government.

The French were building a harbour on the Gulf of Siam, at Kompong Som, to provide Cambodia with its own free port. Khmer was made the one official language of the country and religious instruction in Buddhism was made compulsory in the schools. (Hu. De.)

Education.—Schools (1955): primary 2,671, pupils 324,929; secondary (including teachers' training schools) 12; technical 2; institutions of higher education 4.

Currency.—Monetary unit: riel = 10 metropolitan French francs. U.S. \$1 = 350 metropolitan francs.

Cameroons: see NIGERIA; TRUST TERRITORIES.

Cameroun: see FRENCH EQUATORIAL AFRICA; FRENCH UNION.

Camp Fire Girls: see SOCIETIES AND ASSOCIATIONS, U.S.

Canada. A member of the Commonwealth of Nations, Canada is a federal union covering all of North America north of the United States except Alaska. Area: 3,845,774 sq.mi. Capital: Ottawa (*q.v.*). Governor general, Vincent Massey (*q.v.*); prime minister, Louis Stephen St. Laurent (*q.v.*). Pop.: (1951 census) 14,009,429; (June 1, 1955, official est.) 15,601,000.

History.—Canada in 1956 enjoyed a continuation of the upward trend in business, trade, employment and general material prosperity which had been well established in 1955, after the mild recession of 1954. The gross national product reached an annual rate of \$30,000,000,000, as against just under \$27,000,000,000 in 1955. Even so, planned capital investment was somewhat curbed by the physical limits of available manpower and materials. The latter were massively supplemented by merchandise imports from the United States. Rising prices, credit expansion and an unusually large unfavourable balance in international trade caused some uneasiness, and the Bank of Canada took a number of steps aiming at a mild tightening of monetary policy.

The heightened business activity extended from coast to coast; it was especially marked in Ontario and Quebec, and in British

TRANS-CANADA PIPELINE, a section completed in 1956, which would eventually bring natural gas from Alberta to eastern markets, a distance of 2,200 mi.

Columbia and Alberta. Capital projects of especial magnitude included those connected with the St. Lawrence seaway, which, at the half-way mark, entered on a period of rising tempo. Others included the huge uranium development in the Blind river area of Ontario, the first stages of the trans-Canada gas pipeline which by 1958 was expected to be the longest in the world, bringing natural gas from Alberta to central Canada, the continued search for gas and oil in the prairie provinces and the start on the 650-mi. gas pipeline from the Peace river district to Vancouver, B.C., and the U.S. border.

In June the Pacific Great Eastern railway's extension from Squamish to Vancouver was officially opened; this line was being extended to link the west coast with central and northern Alberta. Construction permits reached their highest levels in history during the year. House building continued at a high level. In September sod was turned for the first commercial atomic energy plant in Canada, situated on the Ottawa river west of the national capital. Another very large harvest of wheat was gathered in, and while wheat exports rose to high levels, stocks were still burdensome and created problems in storage and financing.

The national budget was brought down on March 20. The minister of finance, Walter Harris, had forecast a deficit of \$160,000,000, but buoyant business conditions reduced this to \$52,000,000. Tax cuts were unimportant. A surplus of \$113,000,000 was forecast for 1956-57, and indications before the end of the year were that this would be materially exceeded. Of total expenditures of \$4,440,000,000, about 40% was for national defence, North Atlantic Treaty organization (NATO), etc. The finance minister proposed a 20% tax on advertising revenues of Canadian editions of U.S. magazines to begin Jan. 1, 1957. Some Canadian publishers defended this as protection against unfair competition, but it was widely criticized in the press of Canada as ineffective and discriminatory.

Early in the year a trade delegation from the U.S.S.R. visited Ottawa, Ont., and negotiated a trade treaty for a three-year period. Included in its provisions was a contract for Soviet purchases of Canadian wheat.

Domestic politics were unusually active. No less than six of the ten provinces held general elections to choose a legislature and government for the next four years. The general trend in these was to re-establish the existing party even more solidly in power. In the national sphere, the Progressive Conservative leader, George Drew, was compelled to resign because of ill health, and a national convention was summoned to choose a successor.

A bitter and prolonged debate occurred in the house of commons over the propriety of a large government loan to a private company building the trans-Canada gas pipeline from Alberta.

The fact that the promoters were mainly U.S. oilmen figured in the dispute. One segment of the house fought strenuously for government ownership and operation of the entire line. Scenes of turmoil and all-night sittings of the house developed when the government applied "closure" to get the bill through by the date stipulated in the contract with the private company. The speaker of the house was accused of intolerable partisanship in his handling of the debate, and attempts were made to bring about his resignation. In the end the government was sustained by its substantial majority, but there was widespread criticism of its methods even from the normally friendly press across Canada.

In April the Canadian Congress of Labour and the Trades and Labour congress (Canada's two largest unions) were merged into one body under the title, the Canadian Labour congress. The Canadian and Catholic Confederation of Labour, centred in Quebec, constituting the largest body still outside, met and agreed in principal to affiliation with the Canadian Labour congress, final ratification being postponed until their convention of June 1957.

There was renewed pressure on the federal government to implement the recommendation of the Massey commission of 1951 for the creation of a Canada council to foster and finance a more active cultural life across the nation. A Royal Commission on Broadcasting held sessions in various parts of Canada during the spring and the autumn seeking a solution for the thorny problem of financing Canada's blend of state and private radio and television broadcasts. The extension of a microwave network from eastern Canada to Winnipeg, Man., as part of a program to reach from the Atlantic to the Pacific added considerably to the area of "live" television for simultaneous broadcast; by 1958 this was planned to cover all of Canada.

The current high rate of natural increase and the substantial immigration since 1945 confronted Canadian educators with a problem of finding facilities and teaching staffs for the rising school and college populations. Municipalities appealed to provincial governments for relief, and the national government was urged to take a far more dramatic part in this expansion. Early in October Prime Minister Louis St. Laurent announced that he was prepared to recommend substantially increased national grants to colleges and universities, provided a method could be worked out which did not seem to threaten provincial autonomy.

Education.—In the school year 1952-53 there were 30,731 provincially controlled elementary and secondary schools with 98,125 teachers and 2,666,216 pupils; evening classes had 223,493 pupils. Other provincially controlled schools included 13 schools for the blind and deaf with 310 teachers and 2,054 pupils and 117 normal schools with 1,257 teachers and 10,216 pupils. The 1,169 private elementary and secondary schools had 7,830 teachers and 167,042 pupils. Indian schools numbered 456 with 842 teachers and 25,949 pupils. There were 262 universities and colleges with 10,878 teachers, total enrolment of 106,386 and full-time university grade enrolment of 60,879.

Finance.—The monetary unit is the Canadian dollar, with a par value of U.S. \$0.909 since Sept. 30, 1949. Under the exchange system introduced Sept. 30, 1951, all exchange transactions for U.S. dollars were conducted on a free market in which the value of the Canadian dollar ranged in the first 9 months of 1956 between a low of U.S. \$1.00031 (Feb. 17) and a high of \$1.02656 (Sept. 14). The federal budget for the fiscal year ending March 31, 1957, estimated revenue at \$4,775,000,000 and expenditure at \$4,650,000,000; actual revenue in 1955-56 (preliminary) was \$4,385,400,000, expenditure \$4,437,100,000. The net federal debt on March 31, 1956 (preliminary) was \$11,314,800,000 (1955: \$11,263,100,000). The direct and indirect debt (less sinking funds) of provincial governments was \$3,967,576,000 on March 31, 1955. Currency in circulation on June 30, 1956, totalled \$1,604,000,000; demand deposits, \$4,236,000,000. The U.S. department of commerce estimated U.S. direct private investments in Canada in 1955 at U.S. \$6,464,000,000, of which \$2,834,000,000 represented manufacturing investments and \$1,329,000,000 petroleum investments. National income in 1955 was estimated at \$20,900,000,000. The cost-of-living index stood at 103 in July 1956 (1953=100).

Trade.—Exports in 1955 were valued at \$4,281,784,253 (1954: \$3,881,271,854); re-exports, \$69,499,483 (\$65,644,868); imports, \$4,711,713,197 (\$4,093,196,338). In the first six months of 1956 exports were valued at \$2,270,100,000 (1954: \$2,031,900,000); re-exports, \$34,100,000 (\$31,400,000); imports, \$2,845,300,000 (\$2,209,400,000). In 1955, Canada's principal customers were the U.S. (60%), the U.K. (18%), Japan (2.1%), western Germany (2.1%) and Australia (1.4%). Leading suppliers were the U.S. (73%), the U.K. (8.5%), Venezuela (3.9%), western Germany (1.2%) and Japan (0.8%). Leading exports were newsprint (16%), planks and boards (9.0%), wheat (7.9%), wood pulp (6.9%) and nickel (5.0%). Leading import groups were iron and steel and manufactures (34%), non-metallic minerals and products (except chemicals) (14%, of which petroleum and products accounted for 8%), agricultural and vegetable products (except chemicals, fibres and wood) (12%), nonferrous metals and products (8.6%) and fibres, textiles and textile products (8.1%).

Transport and Communications.—The combined length of railway track in operation on Dec. 31, 1954, was 58,760 mi.; mainline track totalled 43,130 mi. Passengers carried in 1955 totalled 27,000,000 (1954: 28,396,528); freight, 179,776,000 short tons (155,747,000 tons). On Dec. 31, 1955, the merchant marine had 2,596 vessels (100 tons and over) aggregating 2,079,322 gross tons and 14,592 vessels (under 100 tons) aggregating 237,074 tons. In 1955, 34,874,198 short tons of freight were carried through Canada's 11 canals, including 20,893,572 tons through the Welland canal. Canadian airlines carried 2,711,352 revenue passengers and 222,224,900 lb. of revenue freight in 1955. Highway mileage (Dec. 31, 1954) totalled 524,055; surfaced mileage was 192,616. At the end of 1955 motor vehicle registration totalled 3,948,787, including 2,935,412 passenger cars.

On Dec. 31, 1954, Canada had 3,860,269 telephones or 25 per 100 population. In Sept. 1955 there were 179 standard broadcast-band stations, 10 short-wave stations, 31 frequency-modulation stations and 31 television stations and at the end of 1955 more than 1,900,000 television sets.

Agriculture and Fisheries.—Total cash farm income in 1955 (preliminary)

GREAT SEAL of Canada, redesigned in 1956. The seal is affixed to all official documents

9,670,796 pelts were taken, valued at \$30,509,515, of which fur farms accounted for 43%.

Manufacturing.—In 1954 Canada had 38,028 industrial establishments employing 1,267,966 persons who earned \$3,896,687,691; value added by manufacture was \$7,902,124,137 and selling value of factory shipments totalled \$17,554,527,504. Table IV shows the principal statistics of the ten leading manufacturing industries in 1954. Production in 1955 included steel ingots and castings 4,529,401 short tons, pig iron 3,213,764 tons, ferro-alloys 166,682 tons, aluminum ingots 584,153 tons, cement 25,184,050 bbl., passenger cars 375,127, commercial vehicles 79,249. Production of sawn timber was estimated at 7,916,120,000 bd.ft., wood pulp at 10,145,733 short tons and newsprint at 6,190,647 tons. Installed electric energy capacity on Dec. 31, 1955, was 13,905,000 kw.; production (1955) totalled 76,296,630,000 kw. hr.

ENCYCLOPÆDIA BRITANNICA FILMS.—*Industrial Provinces of Canada* (1943); *Manitoba* (1955); *Maritime Provinces of Canada* (1943); *Pacific Canada* (1943); *Prairie Provinces of Canada* (1943); *Prince Edward Island* (1955).

GOV. GEN. VINCENT MASSEY of Canada opening parliament at Ottawa, Ont., Jan. 10, 1956

Canadian Literature. Fiction.—The quality of fiction writing by Canadian authors in 1956 was high. Of the half dozen or so beginning novelists, three achieved immediate note with their books. Gladys Taylor's *Pine Roots* was a fine story about pioneering in the Swan river valley, Manitoba; Adele Wiseman's *The Sacrifice* was a moving account of Jewish life in Winnipeg; Charles Israel's *How Many Angels* was a gentle but penetrating study of war's aftermath on courageous yet sensitive personalities. Veteran novelists who returned with notable books were Earle Birney, *Down the Long Table*, Vera Lysenko, *Westerly Wild*, Ethel Wilson, *Love and Salt Water*, and Mary Douglas, *Take Thy World*.

Poetry.—A reassuring feature of the year was the number of Ryerson press poetry chapbooks issued. Eight poets were provided with a forum which at once encouraged them and gratified poetry lovers. The year's addition of chapbooks brought the total to nearly 170, issued over three decades. The main contribution of the Ryerson chapbooks, however, was that they created a great plain of Canadian verse out of which could (and did) arise from time to time peaks of poetry. In 1956 those peaks took the form of Wilfred Watson's *Friday's Child* (1955), a collection that was at once novel and exciting; Irving Layton's *The Improved Binoculars*, marked by both deftness and passion; and Anne Wilkinson's *The Hangman Ties the Holly* (1955), laden with imaginative and debonair paradoxes.

Nonfiction.—The distinguishing characteristic of the nonfiction of 1956 was the great number of works that fell into the categories of places and people. Regional books were, indeed, outstanding in content as well as in number, and they ranged far and wide over the nation. Robert Legget's *Rideau Waterway* (1955) was the best treatment to date of the historic Rideau Canal across eastern Ontario; Dorothy Dumbrille's *Braggart in My Step* recorded more memories of Ontario's Glengarry county; Basile Robert's *Noranda* was a fragment, dramatic and important, of Canadian mineral development. Larger areas were featured by other books. Paul King and Raymond de Coccia covered the Arctic in *Ayorama* (1955), a study of Eskimo land, where realism and fatalism govern life; Will R. Bird, veteran novelist, travelled off-Trail in *Nova Scotia*, his native province; and Miriam Chapin explored the role and examined the future of *Atlantic Canada*.

People occupied as many authors as places, and most of the studies were satisfying. Especially so were Fred C. Hamill's vivid recapturing of Col. Thomas Talbot, eccentric bachelor of upper Canada fame, in *Lake Erie Baron*; William Kilbourn's cleverly human evocation of William Lyon Mackenzie in *The Firebrand*; and Jessie L. Beattie's loving and delicate study of Hamilton's great Christian Negro, *John Christie Holland*. More scholarly, though not less readable, was John A. B. McLeish's *September Gale*, a study of Arthur Lismer, the artist. More acid, and perhaps therefore less trustworthy, was H. B. Ferns and Ostry's *The Age of Mackenzie King*, the statesman. More worrisome and quite fitting to its subject, James G. Gardiner, the politician, was Nathaniel A. Benson's *None of It Came Easy*. More artless, but not uninforming, was Hilda M. Ridley's *The Story of L. M. Montgomery*, the author. The spate of autobiographies which poured from the presses in 1956 was unusual. Humorist Robert Thomas Allen reported his misadventures in *The Grass Is Never Greener*; Wanda Tolboom recaptured her experiences as an *Arctic Bride*; radio commentator Kate Aitkin relived childhood in *Never a Day So Bright*; Lady Flora Eaton ransacked her past as a retail store merchant in *Memory's Wall*; Charles Comfort related his experiences as an *Artist at War*; Walter S. Woods reascended the ladder to his post of deputy minister of veterans affairs in *The Men Who Came Back*; archaeologist C. T. Currelly dug up his own past in *I Brought Home the*

Ages.

Among other titles of note, the best were Edgar Collard's *Canadian Yesterdays*; Roy M. Wiles's *Serial Publication in England Before 1750*; Edwin C. Guillet's *Pioneer Inns and Taverns*; D. M. Le Bourdais's *Canada's Century* (1955); Bruce Hutchison's *The Struggle for the Border* (1955); Rae Chittick's *Health for Canadians*; Marius Barbeau's *The Tree of Dreams* (French-Canadian folklore); and Thelma Boucher's *One Gardener to Another*.

Juvenile.—It was interesting that a number of the novels for younger readers were written by authors who were already recognized in the adult field. These included Richard S. Lambert with *Redcoat Sailor* (Sir Howard Douglas, builder of Nova Scotia); Josephine Phelan with *The Bold Heart* (Father LaCombe, the prairie missionary); and Roderick Haig-Brown with *Captain of the Discovery* (George Vancouver, the explorer). These three novels hewed closely to the facts of the lives on which they were based, and were part of a series labelled "Great Stories of Canada." Another author of adult books who turned his talents to the juvenile field was Farley Mowat with *Lost in the Barrens*, which was clearly based on his personal adventures in the dangerous Arctic meadows. But that was only part of the 1956 upsurge of juvenile writing. Other teen-age novels included Pamela Stephen's *Winged Canoes at Nootka* (pioneering in British Columbia); D. R. King's *Sukanabi* (fur trading among Alberta Indians); Douglas Spettigue's *The Friendly Force* (the Royal Canadian Mounted Police); Margaret Govan's *The Trail of the Broken Snowshoe* (winter adventure in the Muskokas); Anne MacMillan's *Levko* (racial problems on the prairies); Eva-Lis Wuorio's *The Canadian Twins* (trans-Canada travel); Dickson Reynolds's *Perilous Prairie* (homesteading in Saskatchewan); and J. W. Chalmer's *Red River Adventure* (the Selkirk settlers).

The production of books for preteen readers was one of the most hopeful signs for Canadian juvenile writing. The best of the novels in the new field were *At the Dark of the Moon* (based on Indian lore) by Mabel Tinkiss Good; *A Dog for Davie's Hill* (sheepherding in Scotland) by Clare Bice; and *Judy and the General* (4-H clubbing) by Lyn Cook. The best of nonfiction were *Glooskap's Country* (Indian legends) by Cyrus Macmillan; *The Long Hike* (a recaptured childhood incident) by Dorothy Ivens; and *The Song of Lambert* (a fantasy of a singing lamb) by Mazo de la Roche of "Jalna" fame. (C. Cy.)

French.—The outstanding book of 1956 was *Rue Deschambault*, a collection of autobiographical sketches by Gabrielle Roy, the author of *The Tin Flute* and *The Cashier*. This is a more intimate book, portraying members of her family and friends in a small rural community in Manitoba. This is Gabrielle Roy at her best. The other outstanding books of the year were *La guerre de la conquête* by Guy Frégault, a new book on the Seven Years' War seen from the French-Canadian point of view; *Psychanalyses d'hier et d'aujourd'hui*, by Henri Gratton, a scholarly study of psychoanalysis; and *La Grève de l'Amiante*, a collection of studies of the various aspects, social, economic, political, legal and religious, of the famous asbestos strike.

Many chapbooks of poetry appeared during the year, including *Du centre de l'eau* by J. P. Filion; *Laves et neiges* by G. Cartier; *Larmes* by R. Savard; *Ces Anges de sang* by F. Ouellette; and *Les Cloîtres de l'été* by J. G. Pilon. One thing all of these poets of the younger generation had in common was a basic contempt for traditional ideas and a toilsome effort to create new forms.

No novel of any significance came out in the course of the year. J. Filiatrault's *Chaines* was a diptych opposing two short stories, and the other works in the field of creative writing that deserve a mention were two short comedies, *La Fontaine de Paris* by Eloi de Grandmont and *Le Dodu* by J. Ferron.

A useful book was A. Drolet's *Bibliographie du roman canadien-français* which covers the period 1900-50. (See also LITERARY PRIZES.) (G. SR.)

Canals and Inland Waterways. Inland and intra-coastal waterways which had been improved by the U.S. army corps of engineers, on behalf of the federal government, had in 1956 a total length of more than 28,000 mi. Much of this length, however, represented shallow-draught channels improved many years before, which were no longer of material importance to commercial navigation. About 80% of modern water-borne commerce is carried on 12 waterways with an aggregate length of 5,800 mi. These include such waterways as the Gulf Intracoastal waterway and the lower Mississippi river with its extension up the Ohio to the Pittsburgh area and up the Illinois river to the Great Lakes system at Chicago.

The connecting channels of the Great Lakes link the busiest and most important inland waterway system in the United States and perhaps in the world. This value would be greatly augmented by the 27-ft. St. Lawrence seaway, which was under construction during the year, and the deepening of the connecting channels.

The corps of engineers, in addition to its responsibilities for development and maintenance of the nation's navigable waterways and harbour channels, is charged with compilation and publication of the statistics on water-borne commerce. In Oct. 1956 the corps announced that in the calendar year 1955 the volume of freight carried on U.S. inland waterways reached a new all-time high. In round numbers this volume was 216,500,000,000 ton-mi., compared with 173,700,000,000 ton-mi. in 1954 and 202,400,000,000 in 1953, the previous record year. In the table is shown a breakdown of the ton-mile total for calendar year 1955:

System	Ton-miles
Great Lakes system	118,800,000,000
Mississippi river system	52,000,000,000
Atlantic coast waterways	27,000,000,000
Gulf coast waterways	14,000,000,000
Pacific coast waterways	4,700,000,000
Other waterways	4,500,000
Total	216,504,500,000

Water-borne commerce of the United States generally, which includes coastal harbours and rivers as well as inland waterways, exceeded 1,000,000,000 tons for the first time in history in the calendar year 1955. The total was 1,016,000,000 tons, compared with 867,600,000 tons in 1954 and 924,100,000 tons in 1951, the previous record year.

Appropriations for fiscal year 1957 carried the sum of \$5,000,000 for the initiation of work on deepening the connecting channels of the Great Lakes to 27 ft. from the existing 21 ft. Another appropriation was \$6,000,000 to deepen the Delaware river to 35 ft. between Philadelphia and Trenton from the existing 25- and 28-ft. depths. A third significant appropriation was \$7,700,000 to continue construction of a control plan designed to prevent the capture of the lower Mississippi river by the Atchafalaya river. The amount of \$8,500,000 was appropriated for continuing work on improvement of the Calumet-Sag channel in Illinois to provide more adequate channel dimensions and bridge clearances in that important link between the Mississippi river system and the Great Lakes. Another important appropriation was \$4,500,000 for continuing work on the Plaquemine-Morgan City alternate route, Gulf Intracoastal waterway. Substantial appropriations also were made for modernization of locks and dams on the Ohio river and on the Tombigbee-Warrior waterway.

Funds provided for planning work on various navigation projects in fiscal year 1957 were featured by an amount of \$325,000 for the initiation of planning on the Mississippi river Gulf outlet. This project would provide an additional outlet to the Gulf of

Mexico from the New Orleans area. It would be a shorter route than the existing river route and one that would not be subject to large fluctuations in the stages of the river. The improvement providing a tidewater outlet, had an estimated federal cost of \$88,000,000. (E. C. I.)

Canada.—The Canso canal was scheduled to be in full operation to accommodate 30-ft.-draught vessels with the opening of spring navigation in 1957. It was opened for 10-ft.-draught vessels in Sept. 1955 and later for 12-ft. and 17-ft. vessels. The canal is the navigation lock through the causeway built across the Strait of Canso, which separates Cape Breton Island from the mainland of Nova Scotia.

Total freight transported through all Canadian canals in 1955 amounted to 34,874,198 tons, an increase of almost 16% over the previous year. The transport of iron ore more than doubled. The year 1955 was the first complete season for shipments of Labrador ore. The general increase in freight was accompanied by a 11% rise in the number of vessel passages, from 25,292 in 1954 to 28,172 in 1955. More pleasure craft were using Canada's canals in 1955 than in 1954, a total of 57,605 against 54,031.

By late 1956 construction of the St. Lawrence seaway, which would increase the minimum depth of navigational waters from Montreal to the head of the Great Lakes from 14 ft. to 27 ft., was approximately at mid-point. Begun in 1954, the work was to be completed for the opening of the navigation season of 1959. The St. Lawrence Seaway authority, a crown-owned corporation, had already awarded contracts to a value of more than \$160,000,000 of the \$215,000,000 which would be Canada's share for construction of the navigation facilities.

At Iroquois lock, most westerly of the seven new locks which would replace 21 locks of the old St. Lawrence system, the 3,000-ft. upstream approach wall was virtually complete and the entrance to the lock chamber was being built. The St. Lawrence Seaway authority was building this and four of the other six locks. The downstream approach wall and one side of the St. Lambert lock were scheduled for completion during 1956, and the Côte Ste. Catherine lock structure was making rapid progress, while the two Beauharnois locks were still in the excavation stage.

More than 15,000 men were directly employed on the entire St. Lawrence Seaway and Power project, including 6,000 in Canada and the United States working on the new navigational facilities and 9,000 in both countries in the construction of the power project. (W. H. V. A.)

Great Britain.—The eighth annual report of the British Transport commission was submitted to the minister of transport and civil aviation on June 25, 1956. Total traffic carried on the nationalized waterways in 1955 was 10,477,000 tons, which was 425,000 tons, or 4.2% more than in 1954 (after making adjustments for certain reclassifications). A dock strike in May and June 1955 adversely affected the volume of traffic. The large, single proportionate increase was in the carriage of imported petroleum products and fuel oil. The deficit for 1955 on waterways owing was £176,000 or £85,000 more than in 1954. Gross receipts rose by 3% largely because of increased charges, but expenses increased by 6%. The commission carried in its own craft only about one-fifth of the traffic on its canals and its carrying operations in 1955 resulted in a deficit of £99,000, as against £80,000 in 1954.

A development plan at a total estimated cost of £5,500,000 was approved in principle by the commission toward the end of the year. This plan budgeted for improvements on seven major waterways, including bank protection, lock widening projects, the provision of new plants for dredging and other purposes and improvements of premises. These schemes were expected to be carried out over the next few years as economic conditions permitted.

Belgium.—A national plan was agreed upon for the improvement of seven principal waterways to permit the passage of vessels carrying up to 1,350 tons. Work was begun on the Charleroi-Brussels canal and its principal branch from Seneffe to Louvière; Nimy-Péronnes canal; on the Sambre between Monceau and Namur; on the Meuse between Liège and the French frontier; on the circular canal around Ghent; on the Haut-Escaut; and on the Central canal. To finance these works a 10-year credit was approved of B.fr. 11,000,000,000.

German Federal Republic.—Further progress was made on the Dortmund-Ems enlargement scheme to create navigable conditions for 1,000-ton ships. Work continued in the middle part of the Weser on the scheme for seven barrages between Minden and Bremen, and three barrages were completed for about DM. 30-40,000,000 each. Plans were also made to construct an additional 18 barrages to improve navigation up to Hannoversch-Münden, and it was decided to canalize the Neckar for a length of 24 km. up to Stuttgart. On the main waterway of Rhine-Main-Donau (Danube), the Donau was made navigable up to Regensburg, as part of a general improvement of the waterway between Schweinfurt and Bamberg. It was decided to carry the improvement along the Main up to Bamberg by 1960, and later to build 39 barrages between Bamberg and Regensburg. Freight traffic on the inland waterways of the republic was 124,600,000 tons in 1955, as against 109,400,000 in 1945, an increase of 13.9%.

Cancer. The term cancer is applied to all malignant tumours, and this includes sarcomas—cancers arising in connective tissues (bone, tendon, muscle, etc.)—as well as the much more numerous cancers originating in the skin, the tissues lining the digestive and respiratory systems and the glandular structures. Malignant diseases involving the blood-forming tissues—leukemia, Hodgkin's disease and lymphosarcoma—are regarded as closely related to cancer.

Statistical Trends.—During 1956 in the United States cancer deaths numbered 250,000, a rate of 150 per 100,000. Although the crude death rate showed an increase over the figure for the previous year, the age-standardized death rates for most types of cancer continued to decline or to show no significant change. Cancer of the lung continued to increase, the burden of which was borne largely by males. The favourable trends noted for cancer in general among women resulted largely from improved curability of cancer of the uterus, to which the nation-wide program of public education and improved detection methods contributed.

Financial Support.—The national anticancer program of the American Cancer society was supported by voluntary contributions amounting to \$27,150,000, of which 28%, or \$7,602,000, was allocated for support of fundamental and clinical research and for the training of young investigators and physicians.

The federal government appropriated \$48,432,000 for the government program of research and control, of which \$32,896,000 was in support of laboratory and clinical investigations. Contributions to the Damon Runyon fund, exclusively allocated to research support, totalled approximately \$1,000,000.

Education.—Education of the public stressed the early signs and symptoms of cancer, the importance of early diagnosis and the value of periodic physical examinations. Opinion surveys disclosed that those who know most about cancer have the most

realistic and least fearful attitudes toward it, while those who know least about it are, in general, the most fearful.

Facilities.—The American College of Surgeons reported the existence of 579 approved cancer consultative (diagnostic) and treatment clinics and 123 approved cancer consultative clinics. Eleven approved cancer hospitals were listed. Many new radioactive cobalt irradiators were installed, and research was being carried on in laboratories and hospitals in more than 215 institutions, many of them associated with universities.

Advances.—Further experience with the vaginal cytologic method of diagnosis (smear diagnosis) confirmed its value in disclosing cancer of the uterus, often in a very early stage when the rate of cure is as high as 80%. It became increasingly apparent that wide application of the test could sharply reduce deaths from uterine cancer, the leading cause of cancer deaths among women. Further study of cells in the vaginal secretions suggested a means of determining the best way of treating cancer of the neck of the womb—by surgery or by irradiation—in individual cases. Since the nucleus appears to control cell division, a characteristic feature of cancer, much research interest remained focused on the chemical processes of the cancer cell, especially on how the nuclear substance is formed.

Numerous investigations of the chemical make-up of tobacco and its combustion products were undertaken, and it was reported that fractionation of condensed cigarette smoke had yielded a substance which, when applied to the skin of mice, would cause cancer in a high proportion of them. Additional clinical studies seemed to establish more firmly a relationship between cigarette smoking and lung cancer, but medical opinion differed widely on the significance of this association. Increasing attention was given to air pollution, notably products of combustion, as a possible cause of lung cancer.

The usefulness of carefully planned and selected ultraradical operations for extensive cancer became more firmly established, although some investigators expressed interest in more conservative surgical treatment for cases of early cancer of the breast and thyroid. An extended operation for cancer of the breast was reported as yielding a 10% higher cure rate than the type of operation usually employed.

In other clinical studies, the pituitary gland, located at the base of the brain, was removed in order to eliminate all possible sources of growth-stimulating hormones as a means of controlling rampant cancer of the breast and prostate. Some investigators held that improvement followed in about half the cases, while others were less enthusiastic. Clinical investigation also continued to employ adrenalectomy (removal of the adrenal glands) in an effort to halt the progress of advanced breast cancer. The results of these surgical procedures would be determined after exhaustive follow-up studies.

The question of immunity to cancer was studied in one striking experiment in which 14 healthy volunteers from the Ohio state penitentiary had living cancer cells placed beneath the skin. In no instance did the cancer survive. However, when similar experiments were made in patients who had advanced cancer, 21 of 23 attempts to implant the disease were described as successful. These studies were done in an attempt to show that cancer cells behave like bacterial cells and that some chemotherapeutic agent may be discovered to control the disease.

Developments in the drug treatment of cancer revealed that 14 chemical compounds, four types of hormones and five radioactive isotopes were, with varying success, restraining the course of leukemia, Hodgkin's disease, lymphosarcoma, multiple myeloma, polycythemia and cancer of the lung, ovary, thyroid, breast and prostate. While the results were unpredictable and usually temporary, they represented an epochal advance, the more remarkable for having been achieved in the space of 15

years.

ENCYCLOPÆDIA BRITANNICA FILMS.—*Cancer* (1953).

Candy. More than 1,500 wholesale confectionery manufacturers and almost 2,000 retail confectionery manufacturers in the United States sold more than 3,000,000,000 lb. of candy with a wholesale value at the manufacturers' sales level of \$1,200,000,000 in 1956. Both in poundage and in dollar value this set an all-time record for the industry. These figures compare with sales of 2,724,000,000 lb. of candy with a value of \$1,031,000,000 during 1955.

During 1956 almost 100,000 persons were employed in candy production and an almost equal number in the sale and distribution of candy. More than 2,000,000 confectionery outlets in the United States sold confectionery products, ranging from the supermarket to the small retail candy stand.

A major development in 1956 was the levelling off of cocoa bean prices at an average of about 28 cents per pound, compared with an average price of 35 cents to 40 cents the year before. This resulted in greater use of chocolate in candy and, in turn, resulted in increased sales of confectionery products.

Candy consumption in the United States increased to 17 lb. per person over 16.6 lb. in 1955 and 16.5 lb. in 1954. The all-time high of 20 lb. per person was attained in 1944.

Major developments in the year were: (1) the continued increase in importation of confectionery products from abroad, especially from England; (2) the greater use of automatic equipment on the production line; (3) expansion of the road-side type of candy operation; (4) greater interest in research and product development, with special emphasis on the use of whey and other agricultural products in the production of candy; (5) a sharp increase in the sale of dime bars; (6) an apparent end of the liquidation of smaller manufacturers (which was very much in evidence during the five preceding years); and (7) the production of European-style candies (hitherto imported) by U.S. manufacturers on a franchise basis.

Bar goods sales advanced. Five-cent bars comprised 65% of all bar goods sold in 1956, compared with 67% in 1955 and 70% in 1954.

Imports of sugar candy and confectionery into the United States increased to 30,000,000 lb., with a value of \$10,000,000 in 1956, compared with 25,368,000 lb. valued at \$8,836,000 in 1955. The United Kingdom accounted for 70% of all candy imports; Austria was second with 5% and the Netherlands was third with 4%. Exports of candy and chocolate from the United States continued to be negligible.

(D. Gw.)

Cane Sugar: see SUGAR.

Canning Industry. The United States and territorial pack of canned fruits, vegetables, juices, specialties, milk, meat and fish was approximately 630,000,000 cases during the 1955-56 season, according to the National Canners association. This quantity was 21,000,000 cases more than the 1954 pack and the second highest on record. Five of the seven groups of canned foods, fruits, vegetables, milk, meat and specialties, showed increases in production in 1955 compared with 1954. Only canned juices and canned fish declined in production. The pack of various canned foods from 1939 through 1955 is shown in Table I.

The quantity of poultry used in canning and other processed foods during 1955 reached an all-time high, 1½% above the previous high in 1954. The rise continued during the first eight months of 1956 when the quantity of poultry canned was 12%

more than during the same period in 1955.

The 1,093,000,000 lb. of fish canned in 1955 by U.S. canner was approximately 25% of the total catch of all fish. In 1955 85% of all the salmon caught was canned, 90% of the sardine and 99% of the tuna. The 11 major vegetables produced for processing in the U.S. in 1955 had a farm value of more than \$250,000,000. The farm value of the fruits canned in the U.S. in 1955 exceeded \$140,000,000.

Data published by the U.S. department of agriculture indicated that about 20% of the 1955 U.S. production of all fruits was canned and nearly 50% of the 1955 acreage of all vegetables was processed.

Exports of canned foods from the U.S. in 1955 continued to increase over previous postwar years according to the U.S. department of commerce. Total volume of all canned foods exported from the U.S. in 1955 totalled 903,000,000 lb. and had a value of \$138,000,000. The 1955 tonnage of U.S. canned foods exported was 14% higher than during 1954 and the value was 18% above 1954. Canned meats, milk, fish and specialties represented a slightly larger proportion of the total canned food exports than during recent years. Canned fruits, vegetables and juices accounted for 69% of all U.S. canned food exports in 1955 compared with 72% in 1954. Canned food exports during the first 6 months of 1956 were 20% greater than exports during the same period in 1955.

Canada continued to be the most important foreign market for U.S. canned food exports in 1955, taking 28% of the U.S. exports of canned fruits, 32% of the canned vegetables and 56% of the canned juices.

The 219,000,000 lb. of canned fruits exported from the U.S. in 1955 was the highest since 1947. Canned pineapple, fruit cocktail and peaches continued to be the three major canned fruit items exported from the U.S., accounting for 76% of the total 1955 canned fruit exports.

Tomato juice was the major canned vegetable product exported in 1955, accounting for 23% of all canned vegetable exports. For

canned vegetables as a group, 1955 exports were about 10% above the 1954 exports, and the highest since 1947. Citrus juices accounted in 1955 for nearly 66% of the total exports of canned fruit juices.

The total per capita consumption of canned foods of all kinds in the U.S. during 1955 was about 132 lb.—a slight increase over the previous year. The per capita consumption of the selected groups of canned foods during the 10 years 1946–55 is shown in Table II.

According to the bureau of labour statistics prices of canned fruits and vegetables were quite stable during 1955, averaging 104% of the 1947–49 average compared with 110.9% for all foods. During the first eight months of 1956 retail prices of canned fruits and vegetables increased on the average about 3%, to 107.5% of the 1947–49 average. The average wholesale price index for canned fruits and vegetables during the first eight months of 1956 was 111% of the 1947–49 average for canned fruits and 108.9% for canned vegetables.

Continued progress was made during 1955 in the research investigating the effect of possible application of radiation sterilization to canned foods processing. Additional knowledge was gained concerning the effects of irradiation on nutritive values, taste and odour of canned products.

The development of new canned products proceeded at an accelerated rate in 1955. A number of completely new products were developed and marketed successfully during the year, as well as new combinations of existing products. Especially noticeable were the canned juices that were introduced and marketed for the first time in 1955.

Cartography. **International.**—The 18th International Geographical congress, of the ninth general assembly of the International Geographical Union, was held in Rio de Janeiro, Braz., Aug. 9–18, 1956. Two of the four new International Geographical Union commissions included population mapping and national atlases. In the extensive map exhibit was a noteworthy display of U.S.S.R. maps and atlases. The 20th International Geologic conference was held in Mexico City, Mex., Sept. 4–11, 1956. Outstanding recent maps were displayed by France, Mexico and the U.S.S.R., among other exhibits.

The first report of the working group on the *World Climatic Atlas*, sponsored by the World Meteorological organization and containing specifications for preparing the atlas, was published in Jan. 1956. The U.S. portion of this atlas was to consist of approximately 157 maps at 1:10,000 scale to be completed by 1960.

Western Hemisphere.—The sixth edition of the *Status of Topographic Mapping* was published by the U.S. geological survey at 1:5,000 scale and also at 1:10,000 scale as a sheet of the *National Atlas of the United States*. The geological survey reported that about 1,800 new topographic sheets per year were being produced. A new series of state base maps at 1:500,000 scale was completed for Oregon, Pennsylvania and New York. Maps for the areas of 20 major cities were published at 1:24,000 scale (Washington, D.C. at 1:31,680). The survey printed a list of available aerial photographs illustrating specific physiographic features corresponding to "A Set of One Hundred Topographic Maps."

The orthophotoscope, a device for changing conventional aerial

photographs with their distortions into the equivalent of distortion-free photographs was developed by the survey.

The U.S. army map service reported new processes using rub-on coating for colour printing and brush-graining of zinc and aluminum plates. The bureau of the census published "Census Atlas Maps of Latin America, Central America" at 1:4,000 scale. The U.S. coast and geodetic survey published the *Gulf Coast Gazetteer* and had another in progress for the east coast. The American Geographical society compiled two map series on Antarctica: 4 sheets at 1:3,000 scale, in monochrome, and a dichrome sheet at 1:6,000. The society also completed two of the three sheets at 1:5,000 on Africa. The *National Geographic* magazine produced an excellent 1:3,000-scale map on Alaska. Advance compilations of 12 coastal sheets at 1:20,000 scale were completed of the Kuskokwim bay and river area of Alaska.

In Canada, the University of British Columbia was preparing an atlas of British Columbia. A group of researchers at McGill university was completing a five-year aerial survey of Labrador-Ungava forests with the compilation of 1:1,000-scale maps. The geographic branch, department of mines and technical surveys, published *Canadian Maps 1949–1956*, no. 16 in the "Bibliographic Series." Work continued on the *National Atlas of Canada*. "Britannia Sør," a 1:50,000-scale map of northeast Dronning Louise Land, Greenland, was compiled from aerial photographs by the directorate of colonial surveys and published by the (British) Royal Geographical society.

Cuba and adjacent islands were photographed at about 1:60,000 scale for developmental purposes. A geological map of Mexico at 1:2,000 scale was published. The Geographic Institute of Costa Rica published an initial 13 sheets of a 1:25,000-scale series planned for the entire country. Census atlases were published by Costa Rica and El Salvador and 25 pages of maps and graphs were completed for the "Census of Agriculture of Honduras." A provisional geological sketch map of northern French Guiana was published in three sheets at 1:200,000 scale. Bolivia reported completion of four arcs of first-order triangulation: one extending east and west from Santa Cruz and tied to the Brazilian and Chilean triangulation systems; one from Santa Cruz westward to the Peruvian border; and two parallel arcs extending from La Paz and Santa Cruz southward to the Argentine border. Preliminary work continued in the La Paz area for 8 sheets at 1:25,000 scale. The Military Geographic Institute of Chile announced publication to date of 370 maps at 1:25,000 scale; 18 polychrome sheets at 1:100,000 scale; a preliminary shaded relief map of the country at 1:250,000 scale, and complete coverage at 1:500,000 scale. A folder entitled "Graphic Chile," containing six economic, industrial and agricultural maps at 1:3,000 scale was in preparation. A Spanish-American dictionary of technical geographical terms and a 3-volume geographical dictionary of Chile were prepared.

Europe.—The ordnance survey of the United Kingdom reported that the major and secondary triangulations begun in 1935 were substantially completed. Status reports indicated that the 1:1,250-scale series was 52% completed; the 1:2,500-scale series was nearly 6% completed; the 1:10,680-scale provisional series was 13% completed; and the 1:25,000-scale series was completed for Great Britain except the highlands of Scotland. Volume iv of the *Times Atlas of the World* covering southern Europe and part of Africa was published. An ordnance survey map of Roman Britain at 1:1,000 scale, with text, was published. The Norwegian bureau of statistics published a 16-sheet population map series at 1:400,000 scale covering the country.

A unique cartographic conference, sponsored by Esselte A.B., was held in the Stockholm (Swed.) suburb of Tollare July 26 to Aug. 2, 1956. Delegates from 10 foreign countries discussed map-finishing and reproduction problems. Plates 41–42, 75–76

and 79-80 of the *Atlas of Sweden* were completed. In *Globen*, vol. xxxv, no. 2 (1956) was a comprehensive review of the official Swedish program for long-term mapping, besides a description of the new Swedish 1:250,000-scale map series. The Geographical Society of Finland started work on a new atlas of Finland. The Geographical Institute of Poland published a new geological atlas of the country in five sheets at 1:2,000 scale. Belgium reported publication of 24 maps of the *Atlas of Belgium*. A new Austrian atlas of Salzburg province was published. A forest atlas of Czechoslovakia containing 120 maps was completed, and work was begun on a new geological series at 1:200,000 scale. Initial sheets of the Italian land-use survey on Calabria were completed at 1:200,000 scale.

An Oxford regional economic atlas, *The U.S.S.R. and Eastern Europe*, was published. The U.S.S.R. produced administrative maps ranging in scale from 1:600,000 to 1:1,500,000 of Astrakhan, Moscow, Leningrad, Kalinin and Sakhalin *oblasts*; Atlati and Krasnodar *krais*; Daghestan A.S.S.R., Marii A.S.S.R. and Kazakh S.S.R. The Soviets also produced a physical map of the U.S.S.R. at 1:4,000 scale and administrative maps of the U.S.S.R. at 1:4,000, 1:5,000 and 1:8,000, besides an economic map of the Urals at 1:2,000. More than 100 maps in the state 1:1,000-scale series were reported completed and the remaining 79 were scheduled for completion by 1960. Among recently published geological maps were: a 1:2,500,000 map of the U.S.S.R.; a map of the Siberian platform at 1:1,000, of the Caucasus at 1:500,000; a tectonic map of the U.S.S.R. and adjoining countries at 1:5,000; and a schematic hydrological map of Siberia at 1:5,000 scale.

Asia.—The second meeting of the working party (of the UN Economic Commission for Asia) for a regional geological map for Asia and the far east was held in Bangkok, Thai., on June 9, 1956. Plans were made for financing the map, co-ordinating the various national contributions and their completion dates and preparing index maps showing status of surveys. Nearly one-fourth of Saudi Arabia was photographed by a U.S. aerial survey company for preparation of 1:50,000-scale photomaps.

The one-inch to the mile survey in Burma was scheduled for completion by 1957. The Geographical Institute of Indonesia constructed terrain models of Timor, Sumatra and Minahasa, and was compiling a new 1:250,000-scale map of Java. A geological map of Borneo at 1:1,000 scale was in work. The Japanese were compiling a new series of geological maps at 1:500,000 scale.

Africa.—The committee on the geography of Morocco published five plates with accompanying text for the atlas of Morocco. It was also preparing maps at 1:1,000 scale of vegetation, annual precipitation, geography of diseases and location of minerals.

A geological map of French Equatorial Africa in two sheets at 1:2,000 scale was published by the directorate of mines and geology of French Equatorial Africa and of Cameroun. It also produced a geological map of Madagascar in 13 sheets with overlays at 1:500,000 scale.

Oceania.—The Australian department of external affairs published a map of Antarctica at 1:10,000 scale. Detailed hydrographic surveys of parts of the Papuan coast were being made by a commercial petroleum company.

Cement. In 1955 world output (preliminary) of cement increased to 215,000,000 metric tons (237,000,000 short tons or 1,259,500,000 bbl.) as reported in MINERAL AND METAL PRODUCTION AND PRICES. The U.S. total was 23.6% of the world total.

United States.—As reported by the U.S. bureau of mines, the domestic output of cement for 1948-54 was as shown in the table.

Cement Industry in the U.S.

Preliminary data for 1955 showed another new high record, when 157 plants operated at capacity and progressed with expansion plans. Plants produced 296,829,000 bbl. of portland cement, shipped about 292,698,000 bbl. and exported 1,795,448 bbl. Year-end stocks stood at 17,516,000 bbl. Producers who in Oct. 1954 planned to expand capacity 38% by the end of 1959 apparently held to schedule in 1955, and capacity increased 7% over 1954.

In the first eight months of 1956, output of all types of finished portland cement was 7% higher than in the 1955 period and shipments were 6% higher. Capacity continued to expand.

(F. E. H.)

Census Data, U.S. The total population of the United States, including armed forces overseas, was an estimated 169,000,000 at mid-October 1956, an increase of nearly 18,000,000 from April 1, 1950, the date of the last census. For several years the bureau of the census had estimated an annual average population gain of 2,800,000, of which about 2,500,000 had been by natural increase (excess of births over deaths) and the remainder by net civilian immigration.

On July 1, 1956, according to the census bureau's annual mid-year estimates for the various age groups in the population, the population of all ages was 168,091,000, an increase of about 16,960,000, or 11.2%, over the 1950 census total. Of the total increase, 9,551,000, or 56.3%, was accounted for by the age group under 14 years and 5,540,000, or 32.7%, was accounted for by the age group of 45 years and over. The balance of the increase, 1,869,000, or 11.0%, was accounted for by the group 14 to 44 years of age. Within this group, however, the number of persons 18 to 24 years old decreased by 936,000, or 5.8%. As shown in Table I, the largest percentage increase since 1950 was among children between 5 and 13 years old, 31.7%. The next largest increase was for the population 65 years old and over, with a gain of 18.3%. The number of children under 5

Table I.—Composition of U.S. Population, by Age, 1956 and 1950

Age	Population including armed forces overseas		Change, April 1, 1950 to July 1, 1956	
	July 1, 1956	April 1, 1950	Number	Per cent
All ages	168,091,000	151,132,000	+16,960,000	+11.2
Under 5 years	18,680,000	16,164,000	+2,517,000	+15.6
5 to 13 years	29,213,000	22,180,000	+7,034,000	+31.7
14 to 17 years	9,543,000	8,409,000	+1,133,000	+13.5
18 to 24 years	15,145,000	16,081,000	-936,000	-5.8
25 to 44 years	47,056,000	45,385,000	+1,672,000	+3.7
45 to 64 years	34,028,000	30,720,000	+3,308,000	+10.8
65 years and over	14,426,000	12,195,000	+2,232,000	+18.3

years old increased by 15.6% as the high birth rate of recent years continued.

The white population numbered 149,823,000, an increase of 14,480,000, or 10.7%, over the 1950 total of 135,343,000. The nonwhite population numbered 18,268,000, an increase of 2,479,000, or 15.7% over the 1950 total of 15,789,000. The proportion of nonwhites in the population increased by 0.5%, from 10.4% in 1950 to 10.9% in 1956.

The excess of females over males in the total population increased from about 600,000 in 1950 to nearly 1,400,000 in 1956. The number of males in 1956 was estimated at 83,355,000, an increase of 8,089,000, or 10.8%, over the figure of 75,266,000 in 1950. The number of females, an estimated 84,737,000, had

increased by 8,870,000, or 11.7%, from the figure of 75,867,000 in 1950.

Another census study, based on March 1956 data for the civilian population, developed that of a total estimated gain of 14,700,000 between April 1950 and March 1956, about 12,400,000 was accounted for in the population living in the 168 standard metropolitan areas as defined in 1950 and 2,300,000 was accounted for in the population outside these areas. The civilian population of these metropolitan areas rose from 83,800,000 to 96,200,000, an increase of 14.8%, while the civilian population for the rest of the United States rose from 65,800,000 to 68,100,000, an increase of only 3.5%.

Table II presents the census bureau's estimates of the distribution of the population among the 48 states and the District of Columbia as of July 1, 1956.

Marital Status.—In March 1956, a marital status survey indicated that of an estimated 56,744,000 males and 60,975,000 females in the population 14 years old and over, about 39,967,000 men and 40,650,000 women were married. About 38,306,000 married couples were living together. Of 1,661,000 men living apart from their wives, 862,000 were separated and 799,000 lived apart for other reasons. Of 2,344,000 women living apart from their husbands, 1,242,000 were separated, and 1,102,000 were living apart from their spouses for other reasons. There were 13,516,000 single males and 11,126,000 single females 14 years old and over, about 2,335,000 widowers and 7,707,000 widows and 926,000 men and 1,492,000 women who were divorced.

Fertility of Women.—Women in the higher education brackets had fewer children on the average than women with less schooling, according to an analysis of 1950 census data published in 1956. Women college graduates of childbearing age who had been married 10 years or more had about half as many children on the average (1,954 children per 1,000 women) as married women who had not completed the seventh grade of school (3,632 children per 1,000 women). For all women ever married, 15 to 44 years old, by all degrees of education and durations of marriage, children ever born numbered 1,849 children per 1,000 women in 1950. A later survey, as of April 1954, of which results also were published in 1956, showed a gain in fertility which amounted to about 9.6% between 1950 and 1954 in the average number of children ever born per 1,000 women of childbearing age, 15 to 44 years old, who were ever married. In 1954, the number of children ever born per 1,000 women ever married, had risen to 2,037 children.

School Enrolment.—About 37,235,000 persons, 5 to 29 years old, were enrolled in school or college at the beginning of the 1955-1956 school year, an increase of 7,059,000, or 23%, over the 30,176,000 enrolled five years earlier. Kindergarten enrolment increased by 82%, elementary school enrolment by 24% and high school enrolment by 19%. College enrolment was at a slightly higher level than at the beginning of the 1950 decade, after a decline during the earlier years, with a 1955 total of 2,379,000 in college or professional schools.

College Age Population.—As of July 1, 1955, the number of persons of college age was at its lowest point in 25 years. There were 15,106,000 persons 18 to 24 years old, compared with 16,900,000 at the 1943-1944 peak. The number in this age group had been declining slowly as persons born during the 1930s, when the birth rates were at a low point, reached college age and replaced those in the group born during the late 1920s. The college age group was made up entirely of persons born during the depression years. For the remainder of the 1950 decade, small annual gains were expected. Between 1960 and 1965 the group would grow quite rapidly as the major wave of "war babies" and the initial wave of postwar babies reached college age, gaining, on the average, about 4% per year during this pe-

Table II.—Provisional Estimates of the Population, for Continental United States, by Regions, Divisions and States, July 1, 1956*

Region, division and state	July 1, 1956	April 1, 1950 (Census)	Increase (+) or decrease (—), April 1, 1950, to July 1, 1956 Amount	Per cent

*Figures include persons in the armed forces stationed in each area and exclude members of the armed forces overseas. Each estimate has been independently rounded to the nearest hundred from figures computed to the last digit; hence, the sums of parts shown may differ slightly from the totals shown. Percentages are based on unrounded numbers.

riod. By 1965, persons of college age would number about 20,043,000, one-third more than in July 1955, and by 1973, when the 1954 babies reached college age, this group at an estimated 26,360,000 would be 75% larger than in 1955.

Households and Families.—In March 1956, the estimated number of households (the equivalent to the number of occupied dwelling units) was 48,785,000, comprised of 42,548,000 primary families and 6,237,000 primary individuals. Urban and rural nonfarm households had increased by about 1,000,000 a year while rural farm households had decreased by about 100,000 a year since the beginning of the 1950 decade. Urban and rural nonfarm households numbered 43,136,000 and rural farm households numbered 5,649,000 in 1956 as compared with 37,279,000 urban and rural nonfarm and 6,275,000 rural farm households in 1950.

The average annual increase during the next 20 years in the number of households was expected to range between a low of about 700,000 and a high of nearly 1,000,000, according to a series of four projections published by the census bureau. By 1960, census projections indicated a total of between 50,499,000 and 51,838,000 households, and by 1975 the households total might range from 61,584,000 to 67,378,000. In announcing the projections, the census bureau cautioned that its figures should not be taken as forecasts but as estimates of the number of households which would result under several reasonable assumptions about future population changes.

Estimates of Income.—The median income of families was \$4,421 in 1955 as compared with \$3,319 in 1950, an increase of about \$1,100 or 33.2% in five years. About 41% of all families had incomes of \$5,000 or more; another 41% had incomes ranging between \$2,000 and \$5,000; and 18% had incomes under \$2,000. The 1955 median income of urban families was \$4,840; of rural nonfarm families, \$4,328; and of rural farm families,

29.5% in April 1955 as compared with 28% in 1954 and 21.5% in 1947.

Census of Agriculture.—During 1956, the final results of a nationwide inventory of farms and farm operations, conducted in the fall of 1954, were published, providing new statistics about the agricultural enterprises in each of 3,000 counties. One of the most significant changes revealed by the 1954 farm census was a decline of about 600,000 or 11.1% in the number of farms to 4,782,416, from a 1950 census total of 5,382,162. The value of farm products sold increased, however, by 11.8% to \$24,644,477,087 in 1954 from sales of \$22,051,129,389 in 1949.

The 1954 statistics also revealed that three-fourths of all farms were operated by their owners. The bulk of farm production came from the two-thirds of the farms classified as commercial, and slightly more than three-tenths of the total value of products was accounted for by the 4% of commercial farms with gross sales of \$25,000 or more.

More than 500,000 farms were part-time farms, whose individual sales amounted to less than \$1,200 a year and whose operators worked off the farm for 100 or more days during 1954 or whose family income from nonfarm sources exceeded the farm income. The self-sufficient farm was virtually nonexistent. In 1954, among the commercial farms three in five hired some labour, three in four bought feed for their livestock, four in five bought gas and oil, and seven in ten bought fertilizer. Part-time farms also reported expenditures for one or more of the items. Seven in ten farms reported tractors, more than nine in ten had electricity, more than one-half had telephones, about a third had home freezers and about a third had television sets. The average farm in 1954 was valued at about \$20,000 for land and buildings.

Business Statistics.—Results of the 1954 census of business were published during 1956.

Retail establishments numbered 1,721,650 and reported a year's payroll of \$18,198,662,000 and sales of \$169,967,748,000. At the middle of November, 1955, employees of retail stores numbered 7,124,331, of whom 5,778,351 were full-time workers. In addition, there were 1,765,752 proprietors actively employed in the operation of retail stores.

Wholesale establishments numbered 252,318 with payrolls of \$11,021,450,000 for the year, 2,590,236 employees in mid-November, and 151,213 active proprietors. Merchant wholesalers numbered 165,153, had sales of \$101,100,941,000 in 1954 and year-end inventories of stocks valued at \$9,524,871,000. Manufacturers' sales branches and sales offices numbered 22,590, had sales of \$69,533,784,000 and inventories valued at \$2,152,720,000. Petroleum bulk plants, terminals and liquid petroleum gas facilities numbered 29,189 with sales of \$16,038,372,000 and inventories of \$912,501,000. Merchandise agents and brokers numbered 22,131 with sales of \$39,250,509,000 and inventories of \$103,232,000. Assemblers of farm products numbered 13,255 with sales of \$9,050,816,000 and inventories of \$385,348,000. Combined inventories of all wholesale establishments in the five types of operation were \$13,078,672,000.

Selected service establishments, numbering 786,178, had receipts in 1954 amounting to \$23,408,414,000 and payrolls of \$6,486,968,000. Paid employees in mid-November numbered 2,351,278 of whom 2,015,780 were working full time. There were 784,005 proprietors engaged in operation of service establishments.

The census bureau also announced results of the 1955 annual survey of retail sales with retail store sales amounting to an estimated \$185,484,000,000, an increase of 9% over 1954 sales.

Census of Manufactures.—Total manufacturing employment in 1954, including personnel at manufacturing establishments, central administrative offices and auxiliary units, was

Table III.—Number and Income of Families in the U.S., 1955

Family income	Number of families	Family income	Number of families
Total	42,800,000	\$4,000 to \$4,999	6,600,000
Under \$1,000	3,300,000	\$5,000 to \$5,999	5,400,000
\$1,000 to \$1,999	4,200,000	\$6,000 to \$6,999	4,100,000
\$2,000 to \$2,999	4,700,000	\$7,000 to \$9,999	5,500,000
\$3,000 to \$3,999	6,300,000	\$10,000 to \$14,999 . . .	2,100,000
		\$15,000 and over	600,000

\$2,111. The estimated number of families, by size of income in 1955, is shown in Table III.

Men's income reached a new record level in 1955 with a median of \$3,400, a gain of about \$150 over the previous year. The average income of men had been rising steadily between 1945 and 1952 but levelled off at about \$3,200 in 1953 and 1954. Among women, the median income was \$1,100 in 1955, about the same as during the preceding three years. Since the close of World War II, the average income of men increased by about \$1,500, or 85%, while that of women increased about \$200, or 24%.

Civilian Labour Force.—Employment reached record levels in the summer of 1956. In August the civilian labour force was estimated at 68,947,000 persons, of whom 66,752,000 were employed and 2,195,000 were unemployed.

A work experience survey of the population disclosed that an estimated 75,353,000 persons were employed during all or part of 1955, an increase of 3,554,000 since 1954, the largest addition in any year since World War II. Women accounted for about two-thirds of these additional workers. The number of women with work experience during 1955 climbed to an unprecedented 27,729,000. The number of men with work experience was 47,624,000.

The number of working wives reached an all-time high of 11,800,000 in April 1955, an increase of about 600,000 over the previous year. The proportion of married women in the labour force had increased each year since World War II, reaching

5,153,090 with payrolls of \$66,000,000,000. Employment at operating manufacturing establishments was 15,700,000 with payrolls of \$63,100,000,000. Of the total of 288,144 establishments, 97,666 had between 1 and 19 employees, 63,562 had 20 to 99 employees, and 26,916 had 100 or more employees. Value added by manufacture (value of shipments less cost of materials, supplies, fuel, electric energy and contract work) was reported as \$16,759,421,000. Capital expenditures for new plant and equipment by plants in operation during 1954 amounted to \$7,817,15,000.

Among the 20 major industry groups, transportation equipment industries accounted for \$14,000,000,000 value added by manufacture to lead all groups. The food industries and kindred products group accounted for \$13,500,000,000 value added by manufacture. For other industry groups, value added by manufacture was \$12,300,000,000 for machinery except electrical; \$1,400,000,000 for primary metals; \$9,400,000,000 for chemicals and products of chemicals; \$7,600,000,000 for fabricated metal products; \$7,400,000,000 for electrical machinery; \$6,100,000,000 for printing and publishing; \$5,100,000,000 for apparel and related products; \$4,800,000,000 for textile mill products; \$4,500,000,000 for pulp, paper and products; \$3,800,000,000 for stone, clay and glass products; \$3,200,000,000 for lumber and wood products; \$2,600,000,000 for petroleum and coal products; \$2,100,000,000 for instruments and related products; \$2,000,000,000 for furniture and fixtures; \$1,900,000,000 for rubber products; \$1,600,000,000 for leather and leather products; \$1,000,000,000 for tobacco manufactures; and \$4,100,000,000 for miscellaneous products, including ordnance.

Ceylon. A realm of the Commonwealth of Nations, Ceylon occupies an island southeast of the most southerly point of India. Area: 25,332 sq.mi. Pop.: (1953 census) 8,098,177, including 5,621,332 Sinhalese, 908,705 Ceylon Tamils, 83,146 Ceylon Moors and 984,327 Indians (mostly Tamils); (1955 est.) 8,678,000. Language: Sinhalese 69%, Tamil 21%. Religion: Buddhist 61%, Hindu 22%, Christian (mainly Roman Catholic) 9%, Moslem 7%. Chief towns (pop., 1953 census): Colombo (cap.) 423,481; Jaffna 77,218; Dehiwala-Mt. Lavinia 108,610; Moratuwa 58,160; Kandy 57,359; Galle 55,874; Kotte 58,621. Queen, Elizabeth II; governor general in 1956, Sir Oliver Goonetilleke; prime minister, S. W. R. D. Bandaranaike.

History.—Ceylon was admitted to membership of the United Nations in Dec. 1955, and for the first time a Ceylon representative, R. S. S. Gunawardene, Ceylonese ambassador to the United States, appeared at the rostrum of the general assembly to pledge his country's support for the ideals of the organization. This was the prelude to events marking a new stage in Ceylon's political development since becoming an independent nation in 1948. At a general election in April the United National party, representing the ruling influence in Ceylon for the past generation, suffered an unexpected and overwhelming defeat. Sir Johnotelawala, the prime minister, gave way to S. W. R. D. Bandaranaike, leader of the Socialist M.E.P. party, and a new government was formed. The program of the new government embraced a neutralist foreign policy, in accord with that of

India, the establishment of a republic and the adoption of the principle of nationalization of essential services and industries. It was also laid down that Sinhalese would be adopted as the national language, that imperial honours would be abolished and that agreement would be sought for relinquishment by Great Britain of defense bases in Ceylon. The question of the bases was taken up by the prime minister when he attended a commonwealth conference in London in June-July. While agreeing that the naval station at Trincomalee and the air base at Katunayake should revert to Ceylon, the British government asked for user facilities, and these were the subject of further negotiation in November. In November Bandaranaike visited New York city to address the general assembly of the United Nations. The neutral attitude adopted in foreign relations implied non-involvement in any power bloc, friendship and trade with all countries and support for the United Nations.

At the Suez canal conference in London in August, the Ceylon representative, Sir Claude Corea, high commissioner in the United Kingdom, declared his country's alignment with India, the U.S.S.R. and Indonesia in opposition to the majority proposals of the conference. Subsequently, Corea headed a Ceylon delegation to Moscow and Peking, when it was agreed to set up closer political, economic, trade and cultural relations between Ceylon on the one hand and the U.S.S.R. and the People's Republic of China on the other.

In his budget speech in July the new minister of finance, Stanley de Zoysa, reported an increase in value both of exports and domestic production and stated that the national income per head in 1955 was Rs. 593 as compared with Rs. 572 for the previous year. Goods to the value of Rs. 1,940,000,000 were exported, while the value of imports was Rs. 1,460,000,000, resulting in a favourable trade balance of Rs. 480,000,000. The finance minister gave the total of foreign aid authorized for Ceylon under the Colombo plan, the U.S. aid program and other international schemes as Rs. 110,000,000, which was being received at the rate of Rs. 45,000,000 a year. This enabled the country's six-year development program to be stepped up, and the government decided to establish a national planning board to review long-term economic problems. The decision was also taken to push forward industrialization at a more rapid rate and to accelerate the harnessing of Ceylon's hydroelectric resources.

The six-year Colombo port development scheme, costing Rs. 100,000,000 and involving the building of alongside berths, was completed toward the end of the year. Labour unrest among harbour workers, culminating in a series of strikes, was a serious factor in slowing down the operation of the port. A weekly international air service between Colombo, Amsterdam and London, run by K.L.M. and Air Ceylon under a joint financial arrangement, started in February. A trade agreement was signed with Czechoslovakia, and the rubber-rice agreement with China was renewed.

Celebrations of the 2,500th anniversary of the death of Buddha started in May and made 1956 a historic year in the Ceylon Buddhist calendar. Devotional observances were held at temples and shrines throughout the country, and a series of commemorative postage stamps was issued. A 300-year-old bronze statue of the Buddha was received from Burma. (Jo. HN.)

Education.—Schools (May 1955): aided schools: English primary 20, pupils 12,810, teachers 502; English secondary (including junior) 478, pupils 190,112, teachers 7,355; collegiate 151, pupils 109,315, teachers 4,805; Sinhalese and Tamil 5,215, pupils 1,257,661, teachers 34,602; estate schools 891, pupils 67,110, teachers 1,078; *pirivenas* (religious training schools) 150, pupils 5,848, teachers 609. Unaided schools 64, pupils 16,288, teachers 786. Vocational (including fine arts) 8. Teacher training colleges (English, Sinhalese and Tamil) 18, students 2,905. One university with 2,429 students (1955-56) and (1954) 253 teaching staff.

Finance and Banking.—Monetary unit: rupee with an average exchange rate of Rs. 4.76 to the U.S. dollar in March 1956. Budget (1954-55 revised est.: 1955-56 in parentheses): revenue Rs. 1,158,000,000 (Rs. 1,162,000,000); expenditure Rs. 1,109,000,000 (Rs. 1,268,000,000). Total pub-

lic debt (1954) Rs. 974,181,000 of which Rs. 192,117,000 sterling loan; (1955): Rs. 1,034,315,000 of which Rs. 92,117,000 sterling loan. Currency circulation (Dec. 1954) Rs. 376,000,000, (Dec. 1955) Rs. 384,500,000. Deposit money (Dec. 1954) Rs. 601,000,000, (Dec. 1955) Rs. 675,000,000. Gold and foreign exchange (Dec. 1954) U.S. \$197,000,000, (Dec. 1955) U.S. \$251,000,000.

Foreign Trade.—(1955) Imports Rs. 1,460,000,000, exports Rs. 1,940,000,000. Main sources of imports: U.K. 21%; India 17%; continental E.P.U. (European Payments union countries) 11%; Burma 8%; other sterling area 13%; U.S. and Canada 4%. Main destinations of exports: U.K. 27%; U.S. and Canada 14%; Australia 8%; other sterling area 10%; continental E.P.U. 11%. Main exports: tea 62%; rubber 18%; coconut products 11%.

Transport and Communications.—Roads (fit for motor traffic, 1955) 22,400 km. Motor vehicles in use (1954): passenger 51,800, commercial 19,600. Railways (1955) 1,442 km.; passengers carried (1954) 18,218,556; freight carried (1955) 1,632,000,000 metric tons. Air transport (1955): passenger-km. 9,444,000; freight 168,000 ton-km. Telephones (Jan. 1955) 25,943. Licensed radio receivers (1954) 94,000.

Agriculture.—Main crops (metric tons, 1955; 1954 in parentheses): tea 172,400 (166,300); rubber 95,300 (95,400); coconut oil 154,000 (140,800); copra 290,000 (220,000). Miscellaneous production (metric tons, 1954; 1953 in parentheses): millet 23,000 (22,000); cocoa beans 3,200 (3,000); sweet potatoes and yams 43,000 (42,000); cassava 234,000 (223,000). Livestock (Sept. 1954): cattle 1,227,000; sheep 95,000; buffaloes 707,000; goats (1953) 498,977; pigs (1953) 74,370.

Industry.—Production (1955): electricity 182,400,000 kw.hr.; cement (est.) 79,200 metric tons. Graphite (exports, 1954) 7,885 metric tons.

Chemistry. During 1955 the U.S. chemical industry achieved sales of \$23,500,000,000 and completed new plants worth \$772,000,000. Combined sales of all synthetic organic chemicals during the year amounted to 43,090,000,000 lb. valued at \$5,590,000,000. The country imported \$255,000,000 worth of chemicals.

Indications were that 1956 would prove to be an even bigger year, despite the steel strike during the summer which deprived the chemical industry of a market for chemicals as well as an important source of organic raw materials, the steel industry's coke ovens. Total sales for 1956 were expected to top \$24,000,000,000. During the first half of the year, sales were \$12,100,000,000, 5% above the last six months of 1955. Price increases accounted for only 0.5% of this increase. The Manufacturing Chemists' association surveyed the industry and concluded that it expected to complete \$1,600,000,000 worth of new facilities during 1956 and 1957.

Production for the first six months of 1956 had gained 8% over the same period of 1955 and 2% over the latter six months of that year. In May production hit a record 179 (1947-49 equals 100) as registered by the federal reserve board's seasonally adjusted index. Moreover, during the following two months, the index of production fell off only slightly, to 178.

Raw material consumption for inorganic chemical production was an indication of the vital force inorganic chemical production had become in the national economy. During 1955 the country produced an estimated 5,400,000 long tons of sulphur. This was used mainly to make 15,700,000 short tons of sulphuric acid, the chemical industry's largest single tonnage product. Preliminary figures indicated that both those figures would be surpassed during 1956.

The chemical industry was using 57% of the approximately 9,300,000 tons of lime sold in the U.S. each year. In addition, chemical and related companies were producing another 2,000,000 tons a year for their own use. The industry was taking 75% of the national salt output, which during 1953 amounted to 20,800,000 tons. During that same year, the latest one for which government figures were available, the chemical industry used

12,500,000 tons of phosphate rock, purchased \$539,000,000 worth of fuel and electricity and used 2,800,000,000 gal. of water.

World Trade.—In the important struggle for world chemical markets, west Germany continued to score impressive gains. According to figures compiled by the United Nations, west Germany's chemical exports (combined with those of Austria) had surpassed those of the United Kingdom during 1954. In 1955 the two were exporting chemicals at a rate that was reducing the lead of the U.S.

Value of Chemical Exports of Leading Chemical Exporting Countries

	1952	1954	1955 rate*
United States	\$822,500,000	\$1,031,000,000	\$1,100,000,000
United Kingdom	515,400,000	570,800,000	641,000,000
West Germany and Austria . .	378,900,000	636,000,000	688,000,000
France	286,700,000	336,000,000	346,000,000
Belgium, Netherlands and Luxembourg	318,900,000	341,600,000	369,000,000
Canada	149,800,000	198,900,000	238,000,000

*Based on figures for the first nine months.

Source: United Nations Commodity Trade Statistics.

The seriousness with which the Germans were approaching their task was evidenced by the fact that their exports amounted to more than 20% of their total chemical sales of \$3,400,000,000 during 1955, while U.S. exports came to less than 5% of all U.S. chemical sales. Other striking differences between the two chemical industries were in their corporate make-up. In the U.S. 15 large chemical companies employed 353,000 of the total chemical work force of 800,000 and accounted for 25% of all chemical sales. In west Germany, only three companies employed 103,000 of the 400,000 chemical work force and accounted for 25% of all chemical sales.

Plastics.—The U.S. plastics industry sold 3,200,000,000 lb. of plastics and resins in 1955 valued at \$1,078,000,000. Polyethylene continued to be the fastest-growing single product. Production had risen to 402,000,000 lb., and plants being built were expected to raise capacity to at least 600,000,000 lb. by the end of 1956.

Much interest was being centred on new types of polyethylene. In the conventional process for making it, developed by Imperial Chemical Industries Ltd. (I.C.I.), ethylene is polymerized under pressure to yield a product that is essentially a long chain of carbon atoms placed at random intervals along the main chain. This random side chain branching accounts for polyethylene's flexibility and other physical characteristics. The new polymerizations were utilizing catalysts rather than pressure and were producing highly oriented main chains with little if any side chain branching. These products (linear polyethylenes) are characterized by greater rigidity and considerably higher melting or softening points.

Karl Ziegler had pioneered the new systems in west Germany. But for the most part he had confined his work to polymerization of ethylene (two carbon atoms). In Italy Giulio Natta of the Milan institute had adapted the technique to propylene (three carbon atoms), butadiene (four carbon atoms) and molecules as large as ten carbon atoms. In the U.S., Phillips Petroleum Co. had independently developed a catalyst system that would give substantially similar results. Standard Oil Co. (Indiana) had developed still another catalytic system.

Firms on the European continent, in England and in the U.S. had obtained licences on Ziegler's methods and had advanced them to varying stages of commercialization. Montecatini of Italy, which had sponsored Natta's work, operated a pilot plant for making polypropylene and was building a larger plant to make several tons of polypropylene a day. First products of the plant were expected to be used in moulded articles and films. But polypropylene possesses properties that make it potentially useful for fibres, and Montecatini expected to explore that field

eventually. Montecatini also hoped to try polymerizing molecules larger than propylene. Phillips was building a large plant to make polyethylene by its own process and was licensing several other firms that were in the process of building somewhat smaller plants. Phillips reported that its process could be used to make polypropylene and that it was working on methods for copolymerizing ethylene and propylene to produce a new series of plastics with properties intermediate between those of polyethylene and polypropylene. A number of firms in Europe and in the U.S. were working on polypropylene and the copolymers. Standard Oil (Indiana) revealed no commercial plans for its process, but did grant licences to two other firms that were starting to build commercial plants for it.

The same techniques being used to make linear plastics were stimulating research and development in elastomers. It had long been known that natural rubber was a highly oriented polymer of isoprene. Efforts to duplicate it synthetically failed because of an inability to direct the polymerization toward an oriented product. Goodrich-Gulf revealed that the "synthetic-natural" rubber it had announced in 1954 and had been producing in a pilot plant was made by Ziegler techniques. Goodyear also reported that it had a synthetic equivalent of natural rubber produced by Ziegler catalysis. Firestone was making a comparable product using another catalyst system (lithium metal dispersed in petroleum oil). Phillips was putting its process to good use in synthetic rubber experiments. But even before these products were placed

on the market, scientists were starting to look beyond them to improved rubbers. They knew that there were eight different ways in which isoprene could be joined together to make a highly oriented polymer. It might be possible, they reasoned, to make eight different types of rubber synthetically that way, each of which would be superior to natural rubber for certain applications.

Synthetic Fibres.—Several firms decided to introduce new acrylic (based on acrylonitrile) fibres: American Cyanamid Co. (Acrilan), Tennessee Eastman (Verel) and Dow Chemical Co. (Dacron). Goodrich started semicommercial production of darlan, which began appearing in women's pile coats during the winter of 1955-56. (Darlan is a dinitrile, based on vinylidene cyanide; it is classed with the acrylics because of the similarity in structure and in some physical properties.)

Du Pont introduced a new colour-sealed black nylon made by solution-dyeing, the method of incorporating the pigment right in the polymer. Chemstrand developed a process for dyeing nylon that, it claimed, would combine colour fastness with uniformity of dyeing. Previously, colour fastness had been sacrificed somewhat for uniformity. Japanese researchers developed a fibre made from a wood waste chemical (the methyl ester of a benzoic acid derivative), and the Kokoku Rayon company decided to build a pilot plant for it.

Nuclear Energy.—Chemical engineers were continuing their investigations into nuclear radiation sources to energize chemical reactions. Goodyear was studying gamma-radiation as a substitute for chemicals in vulcanization; a number of refiners were experimenting with it as a means of producing gasoline and lubricating oils. Both fields required a great deal more research before firm conclusions could be reached concerning the commercial practicality of the idea.

Japanese researchers reported favourable results on the use of gamma-rays to improve fibres made from polyvinyl alcohol. They had been able to raise the fibres' wet-heat resistance, thus overcoming one of its principal drawbacks. (Made from cheap materials and possessing some attractive properties, the fibre solves in hot water and does not stand up well under repeated wrings.)

Radiation to kill bacteria in foods, thereby making it pos-

CHEMICAL FOAM, an organic isocyanate which when mixed with alkyd resins, alcohol or water, reacts chemically to produce expanded foam shapes up to 20 times the original volume. The ingredients are mixed together and poured into a mould at room temperature; the completed material is ready in only a few minutes. The chemical was a development of the E. I. du Pont de Nemours and company in 1956

sible to store foods for long periods without refrigeration, had long been a favourite subject for research. One obstacle was that food so treated had an undesirable taste. Co-operative work by the army quartermaster corps and Evans Research and Development indicated that it might be possible to restore the flavour to these foods by the use of enzymes which would act on food precursors unaffected by radiation. (If it proved possible to do this, the same technique might be applied with profit to the processing of some canned and frozen foods.)

In the field of generating electricity through nuclear sources, chemical operations were being employed to solve problems dealing with fuel processing and waste treatment. But even before the problems of harnessing fission for peaceful applications were solved, chemical engineers were starting to look ahead toward the control of fusion (as in the hydrogen bomb). The temperatures involved, however, were of the order of 100,000,000° F., and it seemed that any real progress in that direction would be at least 20 years distant.

Drugs.—The new drugs for mental conditions, introduced in 1955, quickly established themselves in 1956. Estimates of their U.S. sales varied greatly from \$50,000,000 to \$135,000,000 a year. Meproamate (Miltown, Wallace; Equanil, Wyeth) became the nation's largest-selling prescription item. A half-dozen other tranquillizers were vying for a share of the market, which some persons felt would eventually reach \$500,000,000 a year. Early reports of their effectiveness continued to be encouraging. A large Veterans administration hospital in Northampton, Mass., reported that the numbers of mental patients discharged increased 36% after the introduction of tranquillizing drugs. But there was some fear that although they were proving themselves valuable tools in mental therapy, they were being administered too indiscriminately. (See also MEDICINE; PHYSIOLOGY.)

FROZEN NITROGEN glowing at a temperature near absolute zero, a photograph of the element made during a study of free radicals at low temperatures by the U.S. national bureau of standards in 1956

Antibiotics were again proving their versatility. They were being used to preserve food by killing decay-causing bacteria. The U.S. Food and Drug administration authorized antibiotic treatment for poultry, and the Canadian government approved it for fish. It was estimated that spoilage between the time fish was caught and the time it was placed under refrigeration was costing Canadian fishermen \$25,000,000 a year, and it was hoped that antibiotics could prevent a major portion of that loss.

Metals.—The need for zirconium as a material of construction in nuclear reactors moved the U.S. Atomic Energy commission to contract for 2,200,000 lb. of zirconium every year for five years. Three companies were building plants to supply the metal: National Distillers Products Corp., NRC Metals (a subsidiary of National Research Corp.) and Carborundum Metals, which had been the only commercial supplier of zirconium in the U.S.

Normally, chemical engineers consider iron and steel as outside their sphere of operations. But, as indication that the two technologies were moving closer together, seven U.S. steel companies joined with a chemical construction firm, Blaw-Knox Co., in building a demonstration plant for recovering sulphuric acid from waste pickle liquor. Also, Bethlehem Steel Co. and Hydrocarbon Research were investigating a fluid bed process for making pig iron directly from iron ore. (A fluid bed consists of solids so fine that they assume some of the characteristics of a fluid.) Another firm, Dorr-Oliver, Inc., was building a pilot plant of 25 tons' daily capacity for a steel company to employ the fluid bed technique for reducing haematite to magnetite. On a smaller scale, it had experimented with a fluid bed process for reducing haematite to metallic iron in two stages.

Chemical engineers in Great Britain were going a step further. They were exploring a process for making steel directly from iron ore. They revealed that they had been able to make a recognizable form of steel, which they called cyclosteel, by the method. The problems of building equipment to contain the severe conditions called for in this process, however, were thought to be considerable.

Coal v. Petroleum.—Petroleum had gradually replaced coal as the most important source of organic chemicals in the U.S. This trend continued during 1956. Naphthalene, for example, had traditionally been made only from coke ovens. But petroleum refiners were considering making it from their plant streams, either by concentrating the naphthalene present as such or by

demethylating methyl naphthalene.

However, the world's abundant coal reserves, compared with the dwindling supplies of petroleum, had stimulated a great deal of interest in improved methods for obtaining chemicals from coal. Two of the most notable experiments along those lines were being conducted in West Virginia. At Belle, du Pont was running a unit to make synthesis gas (a mixture of carbon monoxide and hydrogen) by oxidizing coal. At nearby Institute Union Carbide and Carbon Corp. was running a large pilot plant to unlock some of the chemical values of coal intact by treating it with hydrogen. In 1956 du Pont decided to switch its coal operations to natural gas for reasons of economy, and Carbide sent its hydrogenation process back to a smaller pilot plant.

New methods for treating coal were springing up, however. Also in West Virginia, Olin-Mathieson Chemical Corp. started a unit to make synthesis gas from coal using a process developed by the Texas Co. In Australia, the State Gas and Electric was getting ready to start a \$22,500,000 plant to make town gas from brown coal (lignite). It was expected to supply one-third of Melbourne's gas requirements. Plans called for the eventual production of chemicals and liquid fuels in the plant.

American Gilsonite forged ahead with plans to build a \$16,000,000 refinery and mining project to make coke and high octane gasoline from Utah gilsonite (a resinous asphaltite). This was the country's first commercial-scale project to make conventional petroleum products from nonpetroleum raw materials. Included in the project was a 71-mi. pipeline to move the solid gilsonite, as a slurry, from the mine to the refinery in Colorado.

New Products.—In co-operation with the U.S. air force and other groups, Dow Corning Corp. produced a fluorinated silicone for the first time. It is able to withstand solvents under a wide range of temperatures. Carbide and Carbon developed a process for making peracetic acid from acetaldehyde. It was claimed that the peracetic acid could be employed economically to put a special functional group (the epoxy bond) on a whole series of chemicals. This was said to permit the production of many new chemicals that had previously been unavailable commercially.

In the agricultural chemical field, gibberellic acid, a rare chemical derived from fungus, was found in limited tests to be a powerful growth stimulant for plants and trees. But even though small quantities (less than 1 part per 1,000,000 in water) demonstrated a pronounced effect, there was so little available that a synthesis would probably be needed for it to become commercially significant, even if it was as effective as the tests indicated. Sesamolin, another rare chemical, was found to be a potent synergist for pyrethrins. But there was no practical commercial process for making it. Two new herbicides, 2, 4-DB and MCPB (derivatives of butyric acid), gave promise of high toxicity toward broadleaf weeds plus low hazard for crops such as alfalfa, corn and clover. The department of agriculture was investigating the possibility of increased biological warfare on insects. It was testing the use of microorganisms—viruses, bacteria, fungi and nematodes—as a supplement to chemicals in controlling insects.

New Processes.—A team of researchers from the Swiss firm Ferminech and Co. succeeded in synthesizing ambergris, the rare perfume ingredient found in the stomachs of sick whales. Dragoco, a German firm, also reported a synthesis of ambergris. Because of the costliness of labour and other factors in making perfume, the work did not open up any opportunity for price reductions in perfumes. It did mean that ambergris might be used in less expensive perfumes. More important, it meant that for the first time chemists would have enough of the compound to explore potential applications in medicine and other fields.

Two groups (General Aniline and Film Corp. and a research association set up by U.S. tanners) developed independent meth-

ods for producing a washable leather. This was expected to be a boon for makers of leather gloves.

A plan for transporting natural gas in liquid form was promising to open up new areas for petrochemical development. Conceived by Willard Morrison (inventor of the "no-draught" windows in autos) for the Union Stock Yards of Chicago, Ill., the idea made use of the fact that during liquefaction natural gas shrinks by a factor of 600. His original project was to make use of the pressure of gas in the wells near the mouth of the Mississippi river to supply a portion of the energy needed to liquefy it. Stored on barges, the liquid would be allowed to vaporize under carefully controlled conditions, and the vapour would be burned as fuel to power the barges to Chicago. On arrival, most of the material would continue to be in the form of a cold liquid, which would be used as a refrigerant in the stockyards. After its cold values had been sapped, it would be a high-quality gas for home or industrial fuel or for use as a chemical raw material.

Continental Oil Co. acquired a financial interest in the project, and a special firm (Constock) was organized. In England, Shell was building barges for a similar project to transport natural gas from Venezuela.

(D. P. B.)

ENCYCLOPÆDIA BRITANNICA FILMS.—*Antibiotics* (1952); *Atom and Agriculture* (1953); *Atom and Biological Sciences* (1953); *Atom and Industry* (1952); *Atom and Medicine* (1952); *Catalysis* (1937); *Chemistry and a Changing World* (1953); *Colloids* (1937); *Electrochemistry* (1937); *Molecular Theory of Matter* (1932); *Oxidation and Reduction* (1932); *Preface to Chemistry* (1954); *Science and Agriculture* (1953); *Velocity of Chemical Reactions* (1937).

Chemotherapy. **Aminitroazole (Tritheon).**—One of a series of related chemical compounds (amino-nitrothiazoles), aminitroazole (2-acetamido-5-nitrothiazole) was shown in 1956 to be effective in the treatment of a protozoan infection, vaginal trichomoniasis, in monkeys when administered orally. Subsequently the drug was used orally for the control of vaginitis caused by *Trichomonas vaginalis* in human beings. This represented the first successful use of a drug given orally in this type of infection.

Bryamycin.—This new antibiotic was isolated from a new species of mould, *Streptomyces hawaiiensis*, obtained from soil collected in Hawaii. Chemically it was shown to be a polypeptide containing sulphur. It was shown to be active against Gram-positive bacteria including *Staphylococcus aureus*, *Streptococcus pyogenes*, *Gaffkya tetragena* and *Diplococcus pneumoniae*. It exhibited little or no activity against Gram-negative microorganisms. When injected into mice, it protected them successfully against experimental infections by *D. pneumoniae* and *Strep. pyogenes*. In animal studies it showed little toxicity, and its activity was not affected by the presence of 10% human serum in test tube tests.

Bynamid (N-butyl-3-phenyl salicylamide).—This synthetic drug, derived from salicylamide, was shown to exert a strong inhibitory effect on fungi of the dermatophyte group, which cause many of the common superficial fungous infections of the scalp, skin and extremities of man. Oddly enough, most of the common saprophytic (nonpathogenic) fungi tested were not inhibited at all. In culture media it proved 6 times more effective than undecylenic acid and 60 times more effective than salicylic acid in restricting the growth of *Trichophyton mentagrophytes* and *rubrum* and *Microsporum audouini* and *canis*. None of these dermatophytes developed resistance to the drug. Another study of Bynamid and 32 other salicylamide derivatives, most of which were also derivatives of 3-phenyl salicylamide, revealed that, all factors considered, Bynamid and N-(4-hydroxyphenyl)-3-

phenyl salicylamide were the best fungistatic agents of the group for the dermatophytes tested.

Clorpactin WCS-90.—This compound was developed from a group of hypochlorous acid derivatives with antiseptic properties. Clorpactin was shown to contain 7% to 8% available chlorine and to sterilize on contact. A study of its virucidal action indicated that it immediately and completely inactivated the Lansing poliomyelitis virus in the test tube; when mixed with virus and injected immediately into animals, it prevented the development of paralysis. It was active also against eastern equine encephalomyelitis virus. The compound showed little or no toxicity in animal studies.

DON.—This new tumour growth-inhibitory substance was isolated from broth culture filtrates of an unidentified strain of *Streptomyces* found in a Peruvian soil sample. It was identified chemically as 6-diazo-5-oxo-L-norleucine, a fine crystalline powder, and was later synthesized chemically. Although the culture filtrates themselves showed growth-inhibitory activity against a wide range of bacteria, fungi and viruses, the purified DON was active against only a few strains of bacteria and fungi and was completely inactive against eight viruses pathogenic for man, as well as against *Endamoeba histolytica*. However it was shown to inhibit markedly the growth of a form of cancer (sarcoma) in mice and several other transplantable neoplasms (tumours) in rodents. Because the drug was shown to be somewhat toxic, further experimental work was required to clarify its applicability to the treatment of cancer occurring in human beings.

Novobiocin.—This new broad-spectrum antibiotic was developed independently by three different research laboratories. It was formerly called streptonivcin and cathomycin. It was isolated from *Streptomyces niveus*, a new species of mould obtained from soil collected in New York. Chemically it was shown to be a dibasic acid entirely different from the previously known classes of useful antibiotics. In test tube cultures it inhibited growth of many Gram-positive and a few Gram-negative organisms; it proved particularly active against *Staphylococcus aureus* and *albus*, *Diplococcus pneumoniae*, *Streptococcus haemolyticus* and *viridans*, *Proteus vulgaris* and *Pasteurella multocida*. It was highly effective in protecting mice against experimental infections with *Staphylococcus aureus*, *Pasteurella multocida* and *Proteus vulgaris*. Various bacteria, especially the staphylococci, developed resistance to novobiocin, as to other antibiotics, but the organisms remained sensitive to other antibiotics. When it was given orally to human subjects and dogs in amounts that were anticipated to be in the therapeutic dosage range, unusually high and well-maintained blood serum levels of the antibiotic were attained. Peak levels occurred 2 to 4 hours after administration, but serum levels remained high for 24 hours. When injected subcutaneously or intramuscularly, it caused considerable local irritation in rabbits and cats, but no significant toxic effects were observed in dogs given the drug by mouth daily for two months. The drug was used in the treatment of human disease caused by staphylococci no longer sensitive to other antibiotics and in infections caused by novobiocin-sensitive organisms in patients who had proved allergic to other antibiotics. There were reports of leucopenia (reduction in the number of white blood cells) following its use.

Plant Oils as Antitubercular Agents.—Certain allium (garlic) bulbs had been shown to contain oils active against the tuberculosis bacillus. During 1956 other substances were isolated from plants growing in India which inhibited the growth of this organism in test tube tests. The volatile oil distilled from a creeping plant (*Tinospora cardifolia*) was particularly effective. Also active were a volatile oil obtained from *Occium canum*, an essential oil from betel leaves, and the active principle of an

edible vegetable (*Ammorphophalus campanulatus*). The latter two substances, however, were only one-tenth as active as the *Tinospora* oil.

Raisnomycin.—This antibiotic was isolated from a new species of soil mould, *Streptomyces kentuckensis*. Although it was isolated only in the impure form, it displayed three different active fractions. Its spectrum of activity against microorganisms differed from that of other known antibiotics; it was highly effective against test tube cultures of Gram-positive bacteria and equally effective against some of the Gram-negative group. It was ineffective against tuberculosis and brucellosis organisms and against the pathogenic (disease-causing) fungi. It was very active against organisms that developed resistance to erythromycin, tetracycline and streptothricin. Raisnomycin, in contrast with most broad-spectrum antibiotics, actually kills bacteria (bactericidal effect) instead of merely restraining their growth (bacteriostatic effect); sublethal concentrations failed to permit the development of resistant strains by any bacteria except *Staphylococcus aureus*, and this resistance occurred only after exposure for a month or longer.

Su 2434.—This compound (n-butyl-p-allyloxy-thionocarbaniolate) was studied for its activity against pinworms in mice. It was found particularly effective against these parasites and superior to the antibiotics, dyes and sulfonamides generally prescribed for human infestation.

ENCYCLOPÆDIA BRITANNICA FILMS.—*Antibiotics* (1952).

Cherries: see FRUIT.

Chess. Arthur B. Bisguier of New York city, United States chess champion, won the 1956 open tournament of the United States Chess federation at Oklahoma City, Okla., in July. Bisguier finished with a count of $9\frac{1}{2}$ – $2\frac{1}{2}$, a score equalled by James T. Sherwin, another New Yorker, but the championship went to Bisguier under the median system of breaking a tie in chess. Robert Steinmeyer of St. Louis, Mo., finished third with a score of 9–3. Bobby Fischer, 13-year-old star from Brooklyn, N.Y., went unbeaten through 12 rounds to deadlock with four other players at $8\frac{1}{2}$ – $3\frac{1}{2}$. In the national speed championship, Sherwin tied with Anthony F. Saidy of Fordham university (N.Y., N.Y.), each scoring $9\frac{1}{2}$ – $1\frac{1}{2}$.

The national amateur tournament of the U.S. Chess federation was held at Asbury Park, N.J., in May and resulted in victory for John Hudson of Philadelphia, Pa., after Hudson, Harry Lyman of Dorchester, Mass., and John Norman Cotter of Harrington, Del., had tied for first with $4\frac{1}{2}$ – $\frac{1}{2}$. The median system of scoring gave the first award to Hudson. Mrs. Kathryn Slater of New York city won a prize for the best score made by a woman contestant and gained recognition as women's amateur champion.

In the United States junior tourney at Philadelphia, Pa., in July, Bobby Fischer triumphed with a final score of $8\frac{1}{2}$ – $1\frac{1}{2}$. The junior speed laurels went to Arthur Feuerstein of the Manhattan (N.Y.) Chess club. Feuerstein won with a score of $4\frac{1}{2}$ – $\frac{1}{2}$, Fischer placing second with a count of 4–1. The Tartakower memorial tournament, held at Detroit, Mich., in September, was won by Donald Byrne of Ann Arbor, Mich. The Michigan state titleholder went through undefeated for a score of $7\frac{1}{2}$ – $\frac{1}{2}$. Bisguier opposed Byrne in the final round but failed to stop him, the match ending in a perpetual check.

Vassily Smyslov, Russian grand master, triumphed in the world challengers' tourney at Amsterdam, Neth. Smyslov, with a final standing of $11\frac{1}{2}$ – $6\frac{1}{2}$, earned the right to oppose Mikhail Botvinnik of the Soviet Union for the world title Botvinnik had held since 1948. Soviet stars easily took team honours in an

international students' tournament at Uppsala, Swed. The winners took 21 games, lost 6 and adjourned 1. Russian masters captured the Hamilton-Russell trophy for the third straight time in September at Moscow. The Soviet team placed first in the event, which ran almost a month, with a score of 31–13. Hungary and Yugoslavia were next with $26\frac{1}{2}$ – $17\frac{1}{2}$.

Larry Evans of New York city triumphed in the first open championship of the Canadian Chess federation held at McGill university in Montreal. By drawing with James Sherwin in 96 moves in his last match, Evans finished with an 8–2 tally, a score matched by William Lombardy of New York city. Tie breaking calculations gave first prize to Evans. (T. V. H.)

Chicago. Second largest U.S. city, a port of entry and the county seat of Cook county, Ill., Chicago lies at the southwest corner of Lake Michigan. The city covers 213 sq.mi., and the metropolitan area encompasses 3,617 sq.mi. The city population in the 1950 census was 3,620,962, and that of the six-county Chicago metropolitan area was 5,495,364. It was estimated that the 1956 population was 3,900,000 in the city and 6,250,000 in the metropolitan area. The mayor in 1956 was Richard J. Daley (Dem.).

Employment in mid-1956 was up by about 80,000 persons over the 1955 average, and unemployment decreased by nearly 40,000 during the same period. Bank clearings for the first nine months of 1956 increased 8.8% to \$42,542,743,798 from \$39,091,674,134 in the same period of 1955. New investment in industrial plants in the Chicago metropolitan area for the first nine months of 1956 amounted to \$482,736,000, an increase of 89% over the \$255,470,000 recorded for the same period of 1955. The dollar volume of industrial production in 1956 was expected to exceed \$20,000,000,000, an all-time record, compared with a production volume of \$19,100,000,000 in 1955. Retail sales in 1956 were estimated at \$8,400,000,000 for the Chicago metropolitan area, approximately 5% more than in 1955.

Steel production in the Chicago metropolitan area in the first nine months of 1956 amounted to 14,847,200 tons, compared with 16,049,000 tons in the same period of 1955. This decline resulted from the nation-wide steel strike in July and August. It was estimated that production would approximate 20,000,000 tons for 1956, as against the record of 21,683,600 tons produced

FIRST FOREIGN SHIPS to be unloaded at Calumet harbour, Chicago, Ill. Opened in Sept. 1956, the new port facilities were built in anticipation of greatly increased international trade after completion of the enlargement of the St. Lawrence seaway.

in 1955.

Chicago continued to be the world's largest centre of rail and air traffic. Midway airport continued to be the world's busiest commercial airport, and the first of the permanent runways at O'Hare field, Chicago International airport, was opened in Sept. 1956. Passenger helicopter service was inaugurated toward the end of 1956 between Midway and O'Hare fields and the loop.

The total number of passengers carried by the Chicago Transit authority during the first seven months of 1956 was 361,275,387, a decline of 0.3% from the 362,400,404 carried during the same period of 1955.

All types of construction permits issued in the first eight months of 1956 increased to \$803,528,711 from \$711,512,832 in the first eight months of 1955, an increase of 13%.

School enrolment in Chicago in the fall of 1956, amounted to approximately 326,990 public and 177,579 Catholic elementary pupils, plus 93,221 public and 41,168 Catholic high school students. The total public assistance expenditures in Cook county for the first eight months of 1956 approximated \$57,592,161, an increase of 1.3% over the \$56,861,837 for the same period of 1955. A monthly average of 146,574 persons were receiving relief during the first eight months of 1956, which compared with 149,7796 persons in 1955.

The 1956 total appropriations for current operations of the governments that cover Chicago, in whole or in part, were: city of Chicago, \$559,000,000; Cook county, \$152,000,000; Cook county forest preserve district, \$7,000,000; Chicago board of education, \$206,000,000; Chicago sanitary district, \$51,000,000; Chicago park district, \$51,000,000; and mosquito abatement district, \$500,000, for a total of \$1,026,500,000.

The total 1955 property tax rate (tax paid in 1956) for the combined six taxing authorities in the city of Chicago was \$3.596 per \$100 of assessed valuation, for all of the city north of 87th street. The rate for the city south of 87th street was \$3.618, which includes the southern Cook county mosquito abatement district.

Total assessed real property valuation for 1955 taxes was \$9,532,892,723 within the city limits.

The general bonded debt, applicable to the city of Chicago, for the general obligations of these same six governments, as of Jan. 1, 1956, amounted to \$440,890,469. In addition, these six governments had outstanding \$180,073,000 in revenue bonds.

The 42-story Prudential Insurance company building was officially opened in Dec. 1955, and work continued on the new 19-story Inland Steel building. Other structures under construction in 1956 were a 14-story building for the America Fore Insurance group; a new 20-story Borg-Warner building; a building for the Morton Salt company; a 6-story Mutual Fund Life Insurance company building; and a new Chicago Sun-Times building.

During 1956 work continued on the \$350,000,000 accelerated expressway program, under which was being constructed a five-fingered radial expressway system from the central business district to outlying areas; the Congress Street superhighway was opened from Lakeshore drive to Laramie avenue, near the western city limits. Construction of the Northwest superhighway and the Calumet skyway continued, and it was hoped to complete the entire system by 1961.

The last of ten municipal parking facilities was completed by the city in 1956.

The Calumet-Sag channel widening project was well ahead of schedule. The Calumet-Sag channel, the new Chicago port and the St. Lawrence Seaway project were expected to revitalize Chicago's position in inland waterway shipping. (L. LN.)

ENCYCLOPÆDIA BRITANNICA FILMS.—*Illinois* (1955); *Middle States* (1955).

Child Labour. **United States.**—Employment of youth 14 through 17 years of age, according to U.S. bureau of the census figures, increased during the year ended June 1956 by about 350,000 over the previous year, maintaining an average of almost 2,500,000. This upswing, reflecting the improvement in general economic conditions, reversed the downward trend in youth employment that had been evident in 1954 and 1955.

In-school youth employed outside school hours accounted for most of this increase, continuing a pattern of youth employment that established itself during World War II. In 1946 approximately one-half of the 14 to 17-year age group who were employed were also enrolled in school; in 1951 the proportion in school was two-thirds; and in 1955 it was up to nearly three-fourths. Most of the employed students of these ages worked short hours—43% worked less than 15 hours a week; about 30% between 15 and 21 hours; and only 27% worked 22 hours or more. These high school boys and girls had jobs mainly in sales, service and on farms.

Although the unemployment rate among out-of-school youth 16 and 17 years of age decreased from 18% in Oct. 1954, to 15% in Oct. 1955, it was still much higher than the 3% rate for adults 20 years of age and over.

The high rate of unemployment among out-of-school youth was of considerable concern during 1956 to educators and welfare officials who were alarmed over the rising wave of juvenile delinquency. The senate subcommittee to investigate juvenile delinquency in its report released during the year urged that studies be made on the employment problems of youth, and that community programs be set up to help youth prepare for and find satisfactory employment.

A national movement to help youth obtain job experience and prepare for the full-time labour market after leaving school that gained momentum during the year was the summer job program. Under this program, local communities were encouraged to set up job programs for youth that would help them obtain suitable summer jobs. The U.S. department of labor, the National Child Labor committee, state employment service agencies and local community service organizations were among the groups working on the program during 1956.

In the field of child-labour standards, the secretary of labor issued a new hazardous occupations order under the Fair Labor Standards act. This order, Number 13, which became effective during 1956, set a minimum age of 18 years for employment in certain hazardous occupations in the manufacture of brick, tile and kindred products. The department concentrated its inspection activity under the act in the logging and sawmilling industries and in agriculture where violations continued to be high.

State Legislation.—During 1956, only a few states amended their child-labour or school-attendance laws. In Pennsylvania the amount of extra workmen's compensation benefits to be awarded to minors injured while illegally employed was raised from 10% to 50% and in New Jersey workmen's compensation coverage was extended to newsboys. On the other hand, newsboys who are independent contractors were removed from coverage under the Mississippi law.

In New Jersey, the child-labour law was amended to permit the limited employment of children in theatrical productions during the summer vacation. Virginia made a few changes in its child-labour and school-attendance laws including one which permits the employment of boys 14 rather than 16 and girls 16 rather than 18 in restaurants operated in connection with seasonal hotels. Judges of juvenile courts were authorized to grant, under certain circumstances, a special work permit to a child not qualified for a work permit under other provisions of the law, if it were deemed for the best interest of the child.

Mississippi repealed its compulsory school attendance law, and North Carolina and Louisiana enacted laws which affected the compulsory attendance of children in integrated schools.

New York and Massachusetts both extended for one year their act authorizing the relaxation, during emergencies, of certain labour laws for minors 16 and over.

Great Britain.—The Agriculture (Safety, Health and Welfare Provisions) act passed in 1956 contained two measures relating to the protection of young workers: (1) to prohibit children under 15 from working in agriculture; and (2) to prohibit children under 15 from riding on or driving vehicles, machinery or implements used in agriculture.

In Jan. 1956 the National Joint Advisory committee set up a committee to consider the training of young workers in industry in light of the expected increase in the number of young persons entering employment and the need to ensure an ample supply of trained workers for future needs. In 1955 almost 1,400,000 youth 15 to 17 years of age and more than 900,000 youth 18 and 19 years of age were employed, an increase of 33,000 over 1954.

International Labour Organization.—No conventions or recommendations dealing specifically with young workers were considered at the 1956 International Labour conference. Two ratifications of child-labour conventions were registered during the year: no. 5, 14-year minimum age for employment in industry, by India; and no. 58, 15-year minimum age for employment at sea, by Japan.

(See also CHLD WELFARE; MIGRATORY LABOUR.)

(E. S. J.)

Children's Books.

Beauty and delight as well as information were offered in the 1956 outpouring of books for children of the United States. Particularly gay and free were the illustrations in many of the new picture books. Luminous photographs of universally familiar objects against a French background made an unusual counting book, *1, 2, 3, 4, 5* by Robert Doisneau, with verses by Arthur Gregor. *What Does A Begin With?* by Nancy Dingman Watson reversed the usual alphabet presentation accompanied by realistically colourful New England scenes. Louis Slobodkin made clear with rhythm and colour that there may be *Millions and Millions* of other things, but "there's only one me and one you." Ylla's superb photographs for *The Little Elephant* by Arthur S. Gregor expressed perfectly the tenderness and humour of this little story. Vegetables were the most highly valued article in the fanciful land of Mandolia in *The Vegetabull* by Jan Le Witt, rich in colour and design. Sophistication and childlike quality mingled in *Jonah the Fisherman*, by Reiner Zimnik, translated by Richard and Clara Winston. Children gained some understanding of colour while they galloped through *The House of Four Seasons* by Roger Duvoisin.

Favourite picture book characters returned to delight children with new episodes. Babar, the elephant king, celebrated the founding of Celesteville with *Babar's Fair* by Laurent de Brunhoff. Virginia Kahl produced two rollicking picture books with a European flavour: *Maxie*, the story of an ingenious dachshund, and *Plum Pudding for Christmas*, which continued the adventures of characters introduced in *The Duchess Bakes a Cake* (1955).

Familiar characters in new settings were among the new picture story books. Bernadine Cook's *The Little Fish That Got Away* found her self-contained youngster (created in line drawings by Crockett Johnson) fishing with an unusual twist. *Mr. Penny's Race Horse* was a skilful mixing of slapstick with honest sentiment (Marie Hall Ets). Children welcomed William Pène Du Bois' highly humorous story of sky-dweller Artist Foreman and his animal factory creations in *Lion*. Author Eve Titus

and artist Paul Galdone created *Anatole*, the story of a French mouse who was an expert on cheeses, for the delight of young and old. In *The Littlest Mouse* Dorothy Lathrop expressed in text and illustration her rare feeling for nature and small, wild creatures.

The past provided the setting for several picture story publications. Illustrated by Marie Nonnast, *The Fourth of July Story* by Alice Dalgliesh continued her accounts of American holidays. Children enjoyed *Christmas on the "Mayflower,"* a story based on real happenings by Wilma Pitchford Hays (illustrated by Roger Duvoisin), and *The Pilgrim Goose*, four stories by Keith Robertson of the geese that came to America in the "Mayflower." *The Silver Mace* by Maud and Miska Petersham related vividly the rise and decline of Old Williamsburg.

Most, but not all, of the 27 tales in *The Little Bookroom* by Eleanor Farjeon had appeared elsewhere. This book received the Hans Christian Andersen medal, the first international children's book award, as well as the Carnegie medal. It is a distinguished book for family sharing illustrated by Edward Ardizzone. Eleanor Farjeon's magical way with words came into full play in her retelling of the most famous fairy tale of the western world, *The Glass Slipper*. Gravity did not exist in the world Palmer Brown fancied for Anna Lavinia in *The Silver Nutmeg*. *The Fairy Doll* (Rumer Godden), *The Enchanted Schoolhouse* (Ruth Sawyer), and *The Last Battle* (C. S. Lewis) represented expert mixture of fantasy and realism.

Families chuckled over the delightful animal characters in Ben Lucien Burman's *Seven Stars for Catfish Bend*, the very large, frustrated giant in Louis Slobodkin's *The Amiable Giant*, and the frustrated elephant in Alain's *The Elephant and the Flea*. *The Good Knight Ghost* by author-artist Jeanne Bendick provided hilarity in abundance.

Animal stories were plentiful. Established authors reappeared with new characters in *Cinnabar*, the *One O'Clock Fox* (Marguerite Henry), *Desert Dog* (Jim Kjelgaard), and *Pagoo* (Holling C. Holling) which told the life story of the hermit crab. Birds shared the spotlight in Thomas Liggett's *Pigeon, Fly Home* (carrier pigeons), and in John and Jean George's *Dipper of Copper Creek* nature was beautifully interpreted.

History for older boys and girls reached a high level in *The Story of the "Old Colony" of New Plymouth* by Samuel Eliot Morison. James Daugherty's *The Magna Charta* recreated an important period in England's history. Travel books lured readers: *At Home in India* by Cynthia Bowles told of her two years there, and *In France* by Marguerite Clément presented the great appeal and diversity of this land and people.

Fiction with an historical background appeared in several of the new publications. Isabelle Lawrence's *Niko: Sculptor's Apprentice* (ancient Greece), Helen Daringer's *The Golden Thorn* (Judea) and Gladys Malvern's *Saul's Daughter* successfully combined love and courage in an historical setting. Rosemary Sutcliffe's absorbing story, *Outcast*, was told against a Roman British background. Older readers enjoyed also the remarkable horse story by Jane and Paul Annixter, *The Runner*, a powerful adventure story by Richard Armstrong, *Cold Hazard* (shipwreck), and several fine offerings set in faraway places, *The Java Wreckmen* by Frank Crisp and *Castle on the Border* (Germany) by Margot Benary-Isbert. Marguerite De Angeli delighted readers again with her tale of adventure, *Black Fox of Lorne*.

Biographical highlights included an easy-reading colourful life story of Charles A. Lindbergh (*Ride on the Wind*) by Alice Dalgliesh, and a charming presentation of St. Valentine by Wilma Pitchford Hays (*The Story of Valentine*). *The Story of Eleanor Roosevelt* by Jeanette Eaton included her role in the United Nations. Mrs. Virginia S. Eifert's Young Lincoln trilogy was completed with the publication of *Out of the Wilderness: Young*

INNOCCHIO SHRINE at Ancona, It., which was unveiled in June 1956 honoring Collodi (Carlo Lorenzini), the author of the famous children's story. The statue was the creation of Emilio Greco, winner over 82 others in a sculpture competition

The Lincoln Grows Up. Abe Lincoln: Log Cabin to White House by Sterling North was an illuminating account of those years before his presidency when he was struggling to find himself.

Well-known nursery rhymes and jingles were set to music in a charming collection by Paul Kapp (*A Cat Came Fiddling*). A comprehensive collection of well-known poems was Herbert Read's *This Way, Delight*. A smaller, but attractive collection by Katherine McEwen (*Away We Go, 100 Poems for the Very Young*) was illustrated by Barbara Cooney.

Nature was not overlooked in the year's presentations. Vincent Brown's *How to Make a Miniature Zoo* was unique and ingenious. *Firefly* by Paul McCutcheon Sears and *See Through the Forest* by Millicent Selsam answered questions through beauty and delight for the younger reader. *The Story of Rocks* by Dorothy Shuttlesworth and illustrated by Su Zan N. Swain was handsome and inspiring, while *The Sea and Its Rivers* by Hilda Malkus and *The Story of Caves* by Dorothy Sterling aroused the curiosity of the older reader.

Outstanding among the year's crop of fact books were Keith Gordon Irwin's *The Romance of Writing: From Egyptian Hieroglyphics to Modern Letters, Numbers and Signs*, Rose Wyler and Gerald Ames's *The Story of the Ice Age*, George Barrow's *Our World in Motion*, Madeline Grant's *Wonder World of Microbes*, James Hemming's *Mankind Against the Killers*, Edward Stoddard's *The Story of Power*, Ronald Jessup's *The Wonderful World of Archaeology* and Louis Sutherland's *Magic Bullets: The Story of Man's Valiant Struggle Against Enemy Microbes*. In addition, many excellent examples of "how-to" books (Virginia Kirkus's *First Book of Gardening*) were pub-

lished in 1956.

Collections of stories were highlighted by Marchette Chute's excellent presentation for young people: *Stories From Shakespeare*. The Greek myths were presented for the adolescent reader in Aubrey De Sélincourt's *Odysseus the Wanderer*, and for the younger reader was Jane Werner Watson's *The Iliad and the Odyssey*, handsomely illustrated by Provenson. H. Herda's collection, *Fairy Tales from Many Lands*, came from Holland to delight all ages. Johanna Spyri's short stories were gathered together in *Pet Lamb, and Other Swiss Stories* offering quaintness with skill.

Attractive new editions of old favourites were welcomed. The increased tempo of established series publication and the mushrooming of several new series reflected the demand for selection guidance in this growing field of publication.

Child Welfare. The most important developments in child welfare during 1956 could be only partially realized within the year. Freedom from the devastation of war in most parts of the world allowed long-range planning toward objectives which, until recent years, had seemed unattainable, planning which required legal and financial commitments without precedent. Consequently even though to many children the year may have brought none of the relief long desired, it was a year of promise.

International Services.—The children of Africa received more service from international efforts than in any previous year. The United Nations Children's fund, known as UNICEF, allocated 15% of its 1956 resources to projects in Africa (Asia 38%, the Americas 24%, eastern Mediterranean 10%, Europe 5%, emergencies 6%, interregional 2%). Only a few years previously the work of UNICEF and other specialized agencies had been concentrated in the more densely populated areas of Asia and in Latin America and the war-torn areas of the middle east and Europe.

The 1956 program of UNICEF devoted about half its services and resources to disease control (malaria 28%, yaws, 8%, leprosy 5%, trachoma 5%, tuberculosis 3%, other diseases 1%); maternal and child welfare services 26%; child nutrition 18%; emergencies 8%. Only ten years previously the work of this agency consisted mostly of relief, requiring millions of dollars for food and clothing, with little left for disease control.

Even if sufficient funds were available, any comprehensive development of child welfare services throughout the world would require years in which the personnel necessary to provide these services could be recruited and trained. UNICEF reported that in 30 of the countries aided there was not more than 1 physician to 10,000 persons. Many countries needing outside help had 3,000 persons or more to 1 physician, compared with ratios of 1 physician to 750 persons in the United States, 1 to 800 in New Zealand and 1 to 1,200 in France. In trying to meet this situation the World Health organization (WHO) invested large sums in the training of physicians, nurses and midwives.

In recent years WHO, UNICEF and Technical Assistance (TA) had combined efforts to carry public health education and services to the most distant and rural parts of the islands comprising the Republic of the Philippines. Radiating from the University of the Philippines and other training centres, with the Philippine government carrying its share, a network of health units was being organized. The country was divided into public health districts, each having one or more small hospitals. These districts were divided into several administrative units within each of which there were to be five to ten village health centres. Each of these local units was to have a graduate midwife in

charge, she being supervised and served by the public health physician in charge of the next higher administrative unit. By late 1956 about 2,000 midwives had been trained within this organization. The most promising of these were to be trained as "qualified midwives," with other better-qualified women being trained as nurses and nursing supervisors. Thus the rate of infant mortality was being reduced and the lives of many mothers saved who otherwise would have died in childbirth.

In Thailand a training course for mothers was conducted in a Buddhist temple.

The ninth World Health assembly, convened in May 1956 in Geneva, Switz., was informed that Iran had begun a seven-year health plan with the help of WHO, with \$75,000,000 allocated for this purpose by the Iranian government. As in the Philippines the heart of this program consisted of the training of personnel, including establishment of a school for sanitarians and several other schools for auxiliary workers. Sixty per cent of the funds voted by Iran were allocated for the eradication of communicable diseases, which in previous years had killed or handicapped large masses of children. At the WHO assembly it was reported that UNICEF was giving help to 282 programs in 95 countries and territories, with 213 of these programs being joint projects of UNICEF and WHO.

Canada.—Several provinces of Canada enacted laws in 1956 liberalizing their social security provisions affecting children. Deserted wives and children became entitled to support under a new Social Assistance act passed by the legislature of Nova Scotia. Mothers' allowances were increased in Ontario, and the age of child beneficiaries was raised in Saskatchewan. Increased appropriations for educational services for defective and retarded children were provided by many municipal and several provincial governments.

Adoption laws in Saskatchewan were revised to increase the rights of an adopted child, especially pertaining to inheritance. Attention was given throughout the country to hazards involved in interprovincial and international adoptions, and there was progress toward development of uniform provincial adoption procedures.

United States.—Desegregation in the public schools in several states where Negroes previously attended separate schools became generally effective in 1956. This was especially true in Kentucky, Maryland, Missouri, Tennessee and the District of Columbia. In some of the largest cities of those states, notably Louisville and St. Louis, municipal recreation facilities also were desegregated. In ten other states there was little or no progress toward desegregation. Mississippi and Virginia enacted laws contradictory to the supreme court ruling, and several other southern states for practical purposes discouraged all efforts to enrol Negro and white children in the same schools. White citizens' councils were widely organized and in some communities incited mobs to demonstrate their opposition to desegregation.

Adoption was a subject of concern to the senate subcommittee to investigate juvenile delinquency, which held hearings on commercial child adoption practices. These hearings revealed that in nearly half the states there was no criminal law against selling babies. Hearings in Miami, Fla., showed that in certain states and communities such deplorable practices had become common, with prospective adoptive parents paying as much as \$1,000 or \$1,500 for a child. The findings of this subcommittee led the U.S. senate in July 1956 to pass a bill protecting children, natural parents and adoptive parents involved in interstate placements for adoption, but the house of representatives took no action on the bill. The Child Welfare League of America and the U.S. children's bureau continued their efforts to unite welfare authorities, private agencies and professional workers

engaged in adoption services in efforts to improve these services and take steps toward outlawing black market adoption practices in all parts of the country.

Juvenile delinquency, as measured by police and juvenile court statistics, increased during 1956. Arrests of offenders under 18 years of age increased 11.4%. Overloaded juvenile courts and overcrowded detention homes were handicaps common in urban communities. For years such factors had led many mildly delinquent young persons to become more delinquent while being held for court appearance. After detention many found themselves in the hands of judges and probation officers too busy and too unprepared for their work to permit them to provide the counsel and supervision needed.

The U.S. senate subcommittee to investigate juvenile delinquency found the territory of Alaska entirely without a juvenile probation staff. The hearings of this subcommittee, published in 1956, revealed that there was only one probation officer in the territory, whose duties within a U.S. district made him available mostly to adult offenders and only to those juveniles coming into federal courts on felony charges. Juvenile delinquency in Alaska had increased notably during the preceding five years, with almost no development of facilities for the prevention, care, treatment or rehabilitation of juvenile delinquents. In New York city and several other metropolitan areas juvenile gangs were responding to preventive efforts being made by detached social workers, men who worked with the gangs in their natural settings.

Pres. Dwight D. Eisenhower called a Conference on Fitness of American Youth, held in June 1956 in Annapolis, Md. Within his cabinet he established the President's Council on Youth Fitness, designed to co-ordinate, stimulate and improve the work of 35 federal agencies. He also appointed a Citizens Advisory Committee on the Fitness of American Youth.

Among more favourable developments was amendment of the federal Social Security act in July 1956, providing extended coverage of old-age and survivors' insurance, whereby about 850,000 persons (many of them children) were assured financial benefits. Anyone totally disabled before age 18 would receive benefits as long as he was totally disabled. During the first year this would add about 20,000 children to the social security rolls. School lunch appropriations were increased by more than 20% for the fiscal year 1956-57 by congressional action in June 1956.

Chile. A republic extending along the southern Pacific coast of South America for about 2,600 mi., Chile has an average width of 110 mi. It is bounded on the north by Peru, on the south by the Antarctic ocean, on the east by Bolivia and Argentina and on the west by the Pacific ocean. It has an area of 286,396 sq.mi. and a population (April 1952 census) of 5,930,809; (1955 est.) 6,855,000. Santiago, the capital, including suburbs, has 1,348,283 inhabitants (April 1952 census). Other leading cities of more than 50,000 are Valparaíso, 218,829 inhabitants; Viña del Mar, 85,281; Concepción, 119,887; Antofagasta, 62,272; Talca, 55,059; Temuco, 51,497; Chillán, 52,576; Talcahuano, 54,782. Religion: Christian, mainly Roman Catholic. President in 1956: Gen. Carlos Ibáñez del Campo.

History.—Pres. Carlos Ibáñez del Campo sponsored a national economic recovery program which checked inflation during 1956, but aroused opposition on the part of leftist groups. The core of Ibáñez' program was a law enacted in January which froze prices at the level prevailing on Nov. 16, 1955, and forbade revision of wages and salaries by more than 50% of the rate of increase in the cost of living during 1956. In the first six months of 1956 the rate of increase in the cost of living was less than a third of that for the corresponding period in 1955, and by July the peso was fairly stable at 495 to the U.S. dollar. Other reforms included abolition of the complex system of official exchange rates, reduction of government expenditures and a ban on luxury imports. Stabilization was assisted by a \$75,000,000 loan from the International Monetary fund, the U.S. treasury and eight U.S. banks.

Efforts of the illegal but powerful Central Labour organization (Confederación Unica de Trabajadores Chilenos) to block passage of the law establishing price and wage ceilings were thwarted by the government. On several occasions the government took decisive action to prevent or terminate strikes which were adjudged illegal. Nevertheless, a September work stoppage by bank employees lasted ten days, and a strike by nitrate workers persisted for three months before settlement was reached. A six-month state of siege (martial law and suspension of civil liberties) was finally imposed in the northern provinces of Antofagasta and Tarapacá.

Chile's deflationary measures, relatively firm labour policy and recent (1955) tax concessions attracted substantial foreign investment capital to the copper, nitrate, steel and petroleum industries. Outstanding projects were initiated in the copper industry, which enjoyed an excellent year because of a world shortage of that metal.

Political opposition to President Ibáñez' economic reforms and his encouragement of foreign capital crystallized in a Communist-inspired coalition of Socialists and other leftist groups. This popular front movement scored important victories in the April by-elections, but lost ground when the government launched an anti-Communist campaign in May. Rumours of a revolutionary plot instigated by former dictator Juan Perón of Argentina placed Chile's armed forces on alert in June. The Radical party was accused of complicity, and the chamber of deputies later censured President Ibáñez for "not having taken measures against Peronista infiltration in Chile." Ibáñez was attending the Panamá conference of American presidents at the time he was censured. The president sought to obtain more solid backing in Congress by appointing members of the Agrarian Labour party to his cabinet in August.

The senate ratified a treaty with Bolivia providing for the construction of a pipeline from the Bolivian oil fields in the Llaco to the Chilean port of Arica. At international meetings in Mexico City and in Ciudad Trujillo, Chile reasserted its claim of jurisdiction over its coastal waters to the 200-mi. limit. A navigation act was passed in June, requiring that half Chile's international cargoes and all its coastwise shipping be carried on Chilean vessels. Supporters of President Ibáñez felt that the law would make effective service impossible, and leading maritime powers objected vigorously.

(See FOREIGN INVESTMENTS.)

Education.—In 1953, 6,851 primary schools and kindergartens had an enrolment of 819,403 pupils; 332 secondary schools (1952) had 86,652 pupils. University education was available at the state university of Chile (14,511 students in 1951), the Catholic university of Santiago (1,751 students), the University of Concepción (1,419 students) and the Catholic university of Valparaíso (637 students). Public education was scheduled to receive 17.5% of government expenditure in 1956.

Finance.—The monetary unit is the peso with a par value of 0.91 cents U.S. currency. Under the free exchange system inaugurated April 20, 1956, the peso was valued on July 31, 1956, at 0.20 cents, bankers' free rate applicable to permissible imports, authorized nontrade remittances and governmental and semigovernmental transactions) and at 0.19 cents,

brokers' free rate. The 1956 budget, as approved by congress in Dec. 1955, estimated revenue at 170,412,707,620 pesos and expenditure at 170,411,045,020 pesos. In 1955 revenue was 137,935,600,000 pesos and expenditure, 156,019,600,000 pesos. The funded external debt on Dec. 31, 1953, was £17,440,974, \$106,595,500 and 85,832,400 Swiss francs; the direct internal debt (Dec. 31, 1954), 18,988,100,000 pesos. Currency in circulation (May 31, 1956) totalled 46,440,000,000 pesos; demand deposits, 105,770,000,000 pesos. The U.S. department of commerce estimated U.S. direct private investments in 1955 at \$636,000,000, of which mining and smelting investments accounted for \$404,000,000. The cost-of-living index (Santiago) stood at 448 in May 1956 (1953=100).

Trade and Communications.—Exports in 1955 amounted to \$474,681,000; imports, \$376,326,000. Leading exports were copper (65%), nitrate of soda (11%), timber (3%) and metallurgical products (2%); leading imports, industrial oils, chemicals and paints (17%), machinery (15%), transport materials (14%), petroleum and products (12%) and sugar (6%). Chief customers were the U.S. (42%), the United Kingdom (17%), Germany (10%), Argentina (10%) and Italy (6%); chief suppliers, the U.S. (43%), Germany (11%), Argentina (11%), Peru (8%) and the U.K. (6%).

The railway system totalled 5,284 mi. in 1950, of which 3,899 mi. were owned by the government. In 1954 there were 30,203 mi. of highways, of which 10,895 mi. were surfaced. On Jan. 1, 1955, there were 45,882 automobiles, 38,565 trucks and 4,951 buses. According to *Lloyd's Register of Shipping*, the merchant marine had 101 vessels (100 tons and over) aggregating 229,774 gross tons on June 30, 1955. Telephones (Jan. 1, 1955) numbered 148,239, 57% of which were located in Santiago.

Agriculture.—Production of the principal crops in the crop year 1955-56 was estimated as follows (in metric tons): wheat 1,031,000; barley 100,000; oats 107,000; rice (paddy) 79,000; maize 107,000; potatoes 637,000. Livestock estimates included cattle (1954) 2,363,700, pigs (1955) 723,000, sheep (1953) 6,500,000, goats (1951) 830,000, horses (1951) 600,000. Wool production in 1955 (clean basis) was estimated at 9,000 metric tons.

Manufactures.—In 1950 there were 5,048 manufacturing establishments with 190,000 employees and gross value of production totalling 43,629,000,000 pesos. Production estimates (1955) included steel 319,000 metric tons; pig iron 256,000 tons; rolled steel products 240,000 tons; wheat flour 720,000 tons; cement 801,000 tons; woven cotton fabrics, about 52,500,000 yd.; paper 52,000 tons; sulphuric acid 27,000 tons; manufactured gas 150,000,000 cu.m.; refined petroleum products 4,780,000 bbl. Installed electric energy capacity (Dec. 1955) totalled 958,000 kw.; production in 1955 (for public use only) was 2,280,000,000 kw.hr. The index for manufacturing industries averaged 104 in 1954 and 100 in 1955 (1953=100).

Minerals.—Production in 1955 included copper 433,570 metric tons; nitrate of soda 1,540,219 tons; iodine 1,114 tons; iron ore (metal content 60%) 1,523,229 tons (exports 1,236,648 tons); coal 2,308,073 tons; silver 1,714,495 fine oz.; gold 122,877 oz. Petroleum production on Tierra del Fuego totalled 409,680 cu.m. (about 2,577,000 bbl.); imports included 2,200,000 bbl. of crude petroleum and 8,490,000 bbl. of refined petroleum products. Annual refining capacity in 1955 was 7,400,000 bbl.

(J. W. Mw.)
ENCYCLOPEDIA BRITANNICA FILMS.—Chile (1940); Chile (people of the country estates) (1955).

China. China borders Korea, the U.S.S.R., Outer Mongolia, Afghanistan, India, Nepal, Bhutan, Burma, Vietnam, Laos and the Pacific ocean. The area is approximately 3,911,209 sq.mi. including Manchuria, Sinkiang, Tibet and Formosa. Population statistics vary. The last Nationalist figure in June 1948 gave the total as 463,493,418 while in Nov. 1954 the Peking government announced that the total population, as of June 30, 1953, was 601,938,035, including more than 19,000,000 outside the mainland. Politically the country remained divided in 1956 into: (1) the People's Republic of China on the mainland plus Hainan and other islands, under the Central People's government in Peking with Mao Tse-tung as its chairman; (2) the Republic of China on Formosa and the Pescadores plus some offshore islands, under the Nationalist government in Taipei with Chiang Kai-shek as its president.

According to Peking's administrative system, China mainland was divided into 22 ordinary provinces plus the autonomies of Inner Mongolia, Tibet and Sinkiang-Uighur region. Peking, Tientsin and Shanghai, the three largest municipalities, remained under the direct administration of the Central People's government. In 1955 ten cities had more than 1,000,000 population: Shanghai, 6,204,417; Peking, 2,758,417; Tientsin, 2,693,831; Mukden, 2,213,000; Chungking, 1,620,000; Canton, 1,600,000; Wuhan (Hankow and Wuchang), 1,500,000; Harbin, 1,200,000; Port Arthur-Dairen, 1,200,000; Nanking, 1,000,000.

History.—During 1956 the foreign policy statements of the People's Republic of China laid emphasis on peaceful coexistence, peaceful liberation of Formosa, denunciation of colonialism and closer ties with Asian-African countries, with the central objective of winning greater recognition and respectability as a

great power and the sole government of China. In domestic affairs there were signs of relaxation in control and promises of greater improvements in living conditions. All these gave an outward manifestation of unity and of co-operation with the Soviet policy of peaceful coexistence and the new concept of nonviolent revolution proclaimed by the Russian leader, Nikita S. Khrushchev.

While Moscow and Peking continued to strengthen their relations, the posthumous purge of Stalin by the present Soviet leaders presented an embarrassing and delicate situation to the Chinese Communists, who had regarded Stalin as the greatest leader and teacher of world Communism, and Mao Tse-tung as the true disciple of Marx and Lenin and the indispensable leader in the Communist movement in China. In denouncing Stalin, Khrushchev stated that by treating China as an inferior Stalin almost drove Mao to break with the Soviet Union, had it not been for the United States hard policy toward mainland China. Peking's reaction to all these pronouncements appeared to be cautious, and it maintained a relative but meaningful silence on the denunciation of Stalin. Opening the first congress of the Chinese Communist party in 11 years on Sept. 15, 1956, Mao made no mention of the controversy on Stalin, and gave fervent support to the Soviet Union as China's great teacher. Soviet Deputy Premier Anastas I. Mikoyan, in a speech at the congress, dealt with the "cult of personality" but praised Mao as a true Marxist and Leninist. Mikoyan reaffirmed the close friendship between the two countries in emphatic terms, and pledged greater aid to mainland China.

Since the seventh Chinese Communist Party congress met in 1945, its membership had grown from less than 1,000,000 to more than 10,700,000. With the purge of Kao Kang and his followers in 1955, Mao's leadership in the party as well as in the government had been without any open opposition. Significant statements by the party leaders at the congress indicating the lines of future policy may be summarized as follows: (1) to further develop friendship and co-operation with "fraternal countries

in the camp of Socialism" on the one hand and to frustrate "completely the scheme of imperialists to create tension" on the other; (2) to establish diplomatic relations with all countries willing to live peacefully with the Chinese People's government; (3) to liberate Formosa by peaceful means; (4) to give active support to the national independence movement in Asia, Africa and Latin America; (5) to support "the entirely lawful action of the government of Egypt in taking back the Suez Canal company" and resolutely to oppose any attempt to start armed intervention against that country; (6) to continue to strengthen national defense and unity between the party and the people; (7) to further develop industries and agriculture by introducing a second five-year plan beginning in 1958.

Another important political development on mainland China during 1956 was the convocation in June of the third session of the First National People's congress consisting of 1,200 deputies, the proceedings of which reflected the new mood of "liberalization" in Communist countries.

The most significant pronouncement made at the session was perhaps the open invitation by Premier Chou En-lai to the Nationalist government in Formosa to conduct peace talks. He offered "amnesty terms to those on Taiwan who might be willing to take the road to peaceful liberation" and jobs and rewards for "meritorious services" in the "peaceful liberation." Chou's declaration was immediately rejected by the spokesmen of the Nationalist government.

Peking's invitation to the Nationalists to peace negotiations appeared to be a corollary of the talks in Geneva, Switz., between the Chinese and United States ambassadors, which entered their second year in Aug. 1956. The talks were held (1) to settle the question of repatriation of civilians and (2) to discuss practical matters at issue between Peking and Washington. From the beginning the Nationalists viewed the Geneva talks with apprehension and pleaded with the United States for their termination. By the end of 1955 the Geneva conference had not been able to dispose entirely of its first agenda item. While Washington insisted on the release of all U.S. civilians on mainland China before other matters could be discussed, Peking requested that the talks be moved to the level of foreign ministers in order

to bring about a quicker settlement on trade embargo and the question of Formosa. As neither side wished to be blamed for a breakdown, the Geneva talks continued to take up both items on the agenda simultaneously.

The negotiations in Geneva had been more or less secret, and only when they reached an impasse were independent statements issued by both sides explaining their positions. From the official statements published in January and June, it could be seen that the basic difficulty was the impossibility in reaching any agreement on the status of Formosa and the Nationalist government. While the United States was ready to renounce the use of force, except defensively, in the Formosa area, Communist China, regarding Formosa as a part of its territory, was not prepared to do so.

CHINA 1956, showing provincial capitals and boundary changes. The cities of Peking, Tientsin and Shanghai were administered directly by the central government of the People's Republic of China

PEKING PROCESSION celebrating the decision of a wealthy Chinese citizen to share his money with the Communist government. The photograph was taken in 1956 by an Egyptian photographer, one of the first persons of a non-Communist state permitted to take pictures freely in China

this stalemate Premier Chou's invitation to Taipei to send a peace negotiation team to Peking was interpreted as merely marking time as Peking did not want to break off talks with the United States.

The uneasy relations between Washington and Peking was aggravated by the shooting down of a U.S. navy plane off the China coast by the Chinese Communists on Aug. 22. The United States strongly protested the attack and asked compensation for the plane and its 16 crewmen. In a reply on Sept. 2 Peking, admitting the incident, rejected U.S. demands for compensation but in turn demanded that "the United States stop its provocative activities." On Sept. 24 the state department in a public reply to Peking's August proposal of abolishing trade restrictions declared that the United States would not discuss this matter so long as the Chinese Communists held Americans in prison and refused to renounce the use of force in the Formosa area.

In January a three-day conference in Washington, D.C., between Pres. Dwight D. Eisenhower and British Prime Minister Anthony Eden touched on the question of trade embargo and China's representation in the United Nations. However, the Eisenhower-Eden joint statement of Feb. 1 disclosed no change in the U.S. position on admission of Communist China into the United Nations but gave indications of the United States' willingness to consider the United Kingdom's proposal for relaxing the embargo.

Concerning the question of Formosa and China's representation in the United Nations, the United States continued its support of the Nationalist government position. On March 16 Secretary of State John Foster Dulles declared in Taipei that the United States had consistently recognized and supported the government of the Republic of China as the only government of China. In early July Vice-Pres. Richard M. Nixon delivered in person Eisenhower's letter to Chiang Kai-shek reaffirming the support of the United States government for the Republic of

China. On July 23 the United States congress declared itself in a concurrent resolution as being unequivocally against the seating of Communist China in the United Nations. In this resolution congress expressed its conviction that admission of "the Communist regime in China would thereby injure the United Nations and its effective functions in accordance with the aims, principles, and provision of the United Nations Charter." Subsequently both the Democratic and Republican party platforms for the 1956 elections contained a plank opposing the seating of Communist China in the United Nations.

Prior to the 1955 general assembly only 17 of the 60 member countries of the United Nations had recognized Communist China. With the admission in Dec. 1955 of 16 new members, 8 of whom had diplomatic relations with Peking, the position of the Nationalist government in the United Nations became more difficult.

In September, a new treaty between Nepal and Communist China was concluded recognizing Peking's sovereignty in Tibet. During his visit to Peking in early October, Pres. Achmed Sukarno of Indonesia pledged support of Peking's task of "liberating" Formosa.

(See also FORMOSA; UNION OF SOVIET SOCIALIST REPUBLICS.)

Education.—Official round figures show an appreciable increase in the 1956 total enrolment in all levels of education on the mainland: primary schools, 62,000,000, an increase of 9,000,000 over 1953; secondary schools, 5,000,000, an increase of 2,000,000 over 1953; higher education, 380,000 as against 220,000 in 1953. A teacher shortage confronted the educational expansion program. For 1956 and 1957 an additional 80,000 secondary and 200,000 primary teachers were needed.

Defense.—In 1956 the regular army was estimated at 2,700,000. With an estimate of about 2,000 planes, including Russian-made jets and bombers, Communist China was no longer a country with a weak air force.

The Nationalist armed forces were estimated at 600,000 men including navy, air force and miscellaneous units. Under the Chinese-U.S. agreement of 1955, a systematic reserve training program began in March 1956 to

train nine reserve divisions as an auxiliary force to the regular army. In July it was announced that to strengthen the Nationalist air force, estimated at 500 planes, more jets would be provided under the United States military aid program.

Finance.—The currency on mainland China is a new Yuan introduced in 1955. The official rate of exchange was maintained at U.S. \$1 = 2.355 Yuan and £1 sterling = 6.86 Yuan. The 1956 budget, as presented to the third session of the People's congress in June 1956, proposed a total expenditure of 30,742,770,000 Yuan (about U.S. \$12,300,000,000), which would be met by a total revenue of 29,731,732,000 Yuan plus a balance credit of 1,011,038,000 Yuan. Final accounts for 1955 showed a total revenue of 30,357,976,000 Yuan (U.S. \$12,100,000,000), 3,154,657,000 Yuan of these representing the balance credit, and expenditures of 29,346,938,000 Yuan (U.S. \$11,700,000,000). Economic construction and national defense accounted for 46.89% and 22.15%, respectively, of the 1955 total expenditure; 52.22% and 19.98%, respectively, of the 1956 estimated budget would go to economic construction and national defense; 48.19% and 47.02%, respectively, of the 1956 revenue would come from state enterprises and taxation.

Trade and Communications.—During 1955 and 1956, more than 80% of Peking's foreign trade was with the Soviet Union and other Communist countries, and attempts were made to bargain for more trade with the west. Imports and exports were regulated to meet the requirements of the first five-year plan 1953-57, and the major portion of the imports were for production purposes. In addition to the traditional exports of raw materials, various products of light industries were exported during the year.

Under the five-year plan 1953-57, about 2,538 mi. of new trunk and branch railway lines and more than 6,210 mi. of highways were to be built. During the first six months of 1956, more than 310 mi. of railway were laid in addition to about 1,640 mi. built between 1953 and 1955. Only about 500 mi. remained to be built to complete the quota under the five-year plan according to the official report. The Chinese section of the Tsinghai-Bator railway, which was to shorten the distance between Peking and Moscow by 600 mi., was completed in 1955. Other railway projects of strategic importance under construction were the Lanchow-Sinkiang railway which would eventually link northwest China with Soviet central Asia, and the Yingtan-Amoy railway connecting the existing Chekiang-Kiangsi railway with Amoy opposite Nationalist-held Quemoy Island. Between 1953 and 1955 about 5,525 mi. of highways were completed, and another 2,865 mi. were being built during 1956.

China: 1957 Goals and Estimated Output of Certain Basic Industrial and Agricultural Products

Item	1952	1954	1955	1957
Coal	63,530	81,990	94,043	113,000
Steel	1,350	2,170	2,567	4,120
Electricity (million kw.hr.)	7,260	15,920
Crude oil	320	1,500
Machine-made paper	370	480	523	650
Grains	164,000	170,000	178,000	193,000
Cotton	1,304	1,092	1,317	1,635

Agricultural and Industrial Production.—The chief aim of the first five-year plan was socialist transformation of agriculture and the building of a preliminary foundation for socialist industrialization. The plan called for a total outlay of 76,640,000,000 Yuan (U.S. \$32,337,552,000), of which 42,740,000,000 Yuan (U.S. \$18,033,756,000), or more than 55%, were earmarked for investment in capital construction of about 1,600 major projects. Of these 455 were in industry, and prior to 1956 the Soviet Union had agreed to supply equipment for 156 of these industrial projects under the five-year plan. The value of Soviet aid for the 156 projects was estimated at 5,600,000,000 roubles (U.S. \$1,400,000,000) by Nikita S. Khrushchev. In April 1956 Moscow agreed to provide equipment and technical assistance to 55 more projects, including the building of the Lanchow-Urumchi-Alma-Ata railway. The five-year plan stipulated that the total output of industry in 1957 was to reach 53,560,000,000 Yuan. In June the chairman of the planning commission reported to the People's congress that in 1955 the actual industrial output had reached 44,750,000,000 Yuan; and that it would reach 53,580,000,000 Yuan toward the end of 1956, thus attaining the industrial output target one year ahead of schedule.

Although less than 8% of the total capital investment under the five-year plan was earmarked for agriculture, the collectivization of agriculture was rapid. According to the official report, about 110,000,000 peasant families had become members of some sort of co-operative, and 56% of them were members of Soviet-style collective farms in March 1956. Collectivization was an integral part of the five-year plan to increase agricultural production, and the 1957 target for grain production was 192,800,000 metric tons, or a 17.6% increase over 1952. The official figures for grain production for the past three years were: 167,000,000 tons in 1953; 170,000,000 tons in 1954; and 178,000,000 tons in 1955.

ENCYCLOPEDIA BRITANNICA FILMS.—*People of Western China* (1940).

Chiropractic. Chiropractic is a science based on the premise that malfunction and disease often result from lack of normal nerve function. The doctor of chiropractic, by general manipulation and specific adjustment of the structures of the body and the use of clinical nutrition, physiotherapy and psychotherapy, as indicated, seeks to restore normal nerve function, thereby enabling the protective and restorative powers

of the body to function normally.

The 61st anniversary convention of the National Chiropractic association was held in Chicago, Ill., July 1-6, 1956. High-lighting the convention agenda was a series of scientific symposia covering important developments in diagnostic procedure, adjusting technique, X-ray interpretation, poliomyelitis, physiotherapeutic practices and public health problems. Minimum standards of four academic years, totalling 4,000 hours, are required in the eight nonprofit colleges accredited by the National Council on Education. Twenty-two states now require two years pre-professional training, in addition to the four-year professional course, before licensure.

The 1957 convention was to be held at the Ambassador hotel in Los Angeles, Calif., July 14-19, 1957.

The Public Affairs institute of Washington, D.C., published an appraisal of the healing arts, titled *Health Service Is a Basic Right of All the People*, and a study of the chiropractic profession, *The Present Day Doctor of Chiropractic*, both of which received wide distribution.

Important activities during 1956 included: (1) a Public Relations conference in Memphis, Tenn., Jan. 22-23, which resulted in nation-wide sponsorship of Correct Posture week, May 1-7, and Chiropractic day, Sept. 18, by the chiropractic profession; (2) establishment of scholarships in each of the National Chiropractic association accredited colleges; (3) creation of a series of sound, colour films for television showing; (4) plans for a series of health columns to appear in small daily and weekly newspapers throughout the United States; (5) educational exhibits at the conventions of the American Association of Junior colleges and the American Personnel and Guidance association.

Official publications are *Healthways Magazine*; the *Journal of the National Chiropractic Association*; *Chiropractic News*; *Chiropractic—A Career*. Headquarters: National building, Webster City, Ia. (L. M. R.)

Christian Science. Growing interest in spiritual healing was reported by a number of departments of the Mother Church, the First Church of Christ, Scientist, in Boston, Mass., during 1956. More than \$250,000 was expended during the year to provide for the physical, mental, moral and spiritual welfare of those in the armed forces interested in Christian Science. Progress of the denomination's healing and redemptive work was reflected in testimonies published regularly in the *Christian Science Journal*, the *Christian Science Sentinel* and the *Heralds of Christian Science* in various editions. They included healings of cancer, tuberculosis, paralysis, deafness, carious bones, physical deformity and many other serious conditions.

It was reported that there was increasing recognition of Christian Science care in major medical, health and accident, automobile medical expense and other casualty insurance policies.

A marked increase in sales of the Christian Science textbook, *Science and Health with Key to the Scriptures* by Mary Baker Eddy, the discoverer and founder of Christian Science, was announced by the trustees under her will.

Gratifying response from the television and radio series "How Christian Science Heals" was also noted. Increased church and lecture attendance, as well as increased use of Christian Science reading rooms, were reported. More than 200 television stations in the United States and Canada carried the filmed Christian Science programs during the year.

In addition, more than 800 radio stations also carried the series which featured accounts of spiritual healing told by those who actually experienced them.

A special 50-minute film called *The Earth Shall Be Filled* was

released for distribution in the 48 countries in which the Mother Church had branches. The film featured three of the "How Christian Science Heals" programs and background information about the television series.

Among the new branches of the Church added during the year were those in Miranda, Austr.; Barnstaple and Sidmouth, Devonshire, Eng.; Dortmund and Trier, Ger.; Helsinki, Fin.; Asan Point, Guam; and Vlaardingen, Neth.

Progress in the activities of the *Christian Science Monitor*, the denomination's international daily newspaper, was reported. The series "Today's Great Issues and the Bible Answers" met with substantial response from readers. Advertising lineage reached a total of 8,689,016 lines, the highest in *Monitor* history.

During the year, 15 Christian Science chaplains were on active duty with the United States army, navy and air force.

(W. B. Ds.)

Christian Unity. An active interest in church union found expression in 1956 in concrete proposals and negotiations in three different continents.

North America.—The union of the Congregational Christian Churches and the Evangelical and Reformed Church in the United Church of Christ" was scheduled for June 25, 1957, when the constitution of the new body was to be adopted. The basis of union between the two bodies was approved by the Evangelical and Reformed Church in 1947 and by the Congregational Christian Church in 1948. The united body would have a membership of more than 2,000,000.

At the International Convention of the Disciples of Christ held in Des Moines, Ia., Sept. 28-Oct. 3, 1956, authorization was given to explore the possibility of its joining with the Congregational Christian Church and the Evangelical and Reformed Church in the formation of this "United Church of Christ." If this should happen, the resulting body would have a membership of approximately 4,000,000.

The merger of three Lutheran bodies, the American Lutheran Church, the Evangelical Lutheran Church and the United Evangelical Lutheran Church, was scheduled for 1960. The Lutheran Free Church, which had been a participant in the negotiations in the earlier stages, did not secure the necessary vote of three-quarters of its local congregations when the proposal was submitted to them in a referendum in 1956. Another Lutheran body, however, the Finnish Evangelical Lutheran Church, in June 1956 authorized its Commission on Inter-Synodical Affairs to investigate and report on the wisdom of its joining with the three Lutheran bodies which were already committed to the union.

Two other large Lutheran bodies, the United Lutheran Church in America and the Augustana Lutheran Church, jointly invited other Lutheran bodies in America to enter into discussions concerning an inclusive Lutheran union. In his address as president of the United Lutheran Church, at its biennial convention held in Harrisburg, Pa., in Oct. 1956, Franklin Clark Fry emphasized church unity.

The Presbyterian Church in the U.S.A. and the United Presbyterian Church of North America, in their general assemblies in May and June 1956, approved a plan of union for the two denominations in a new body to be known as the United Presbyterian Church in the U.S.A. Before the plan became effective, however, it had to be approved by two-thirds of the presbyteries of both bodies. The vote by presbyteries was being taken during 1956-57. The plan of union followed the general line which was earlier proposed for a three-way union, including the Presbyterian Church in the U.S. (southern), which, however, had rejected the proposal in 1955.

The American Unitarian association, at its annual meeting in Boston, Mass., in May, created a commission to study the pos-

sibility of merger with the Universalist Church of America. These two denominations had already federated their departments of education and, in part, their departments of public relations and publications. The commission created by the Unitarians was instructed to report whether the present federated arrangement should be continued or whether complete union should be sought.

In Canada union negotiations between the United Church of Canada and the Anglican Church of Canada, quiescent for several years, received a new impetus in 1956. The General council of the United Church of Canada and the Executive council of the Anglican Church in Canada both voted to continue negotiations and to open the way for other Canadian bodies to join in the discussions.

A national study conference on "The Nature of the Unity We Seek," to be held on the campus of Oberlin college, Oberlin, O., Sept. 3-10, 1957, was announced by the U.S. Conference for the World Council of Churches, the National Council of Churches and the Canadian Council of Churches. Sixteen regional study groups in different parts of the country were carrying on preparatory discussions and studies. About 40 different denominations were in the process of appointing delegates to the Oberlin conference, the purpose of which was defined as the seeking of answers to fundamental questions which underlie any successful plan of church union.

Europe.—In Great Britain discussions on the establishment of intercommunion proceeded in 1956 in two groups. The first included the Church of England and the Methodist Church; the second, the Church of England and the Presbyterians. In the latter case, the Presbyterians included both the Church of Scotland and the Presbyterian Church of England; and on the Anglican side, the Episcopal Church of Scotland was participating as well as the Church of England. The central interest in British discussions dealt with the possibility of an agreement which would effect intercommunion, rather than union in a single ecclesiastical body.

In the Netherlands the question of intercommunion was also prominent. On May 30, 1956, the synod of the Evangelical Lutheran Church decided to accept an agreement with the Netherlands Reformed Church on Holy Communion. This was the outcome of the work of a commission of theologians which was appointed to examine the differences in the doctrine of Holy Communion between the Reformed and the Lutheran branches of Protestantism. The commission drew up a "Consensus on Holy Communion" and made proposals for the interchange of pulpits and intercommunion. The General synod of the Reformed Church accepted the proposal on Feb. 2, 1956. The subsequent action of the Evangelical Lutheran Church made it possible for ministers of either church to celebrate Holy Communion in the other. It did not involve a merger of the two churches.

In May 1956 the Original Secession Church in Scotland reunited with the Church of Scotland (Presbyterian) after a break which had lasted for 223 years. The Original Secession Church was a small body consisting of 14 congregations.

Asia.—A plan for union between the Methodists and the Congregationalists in Australia, modelled largely on the constitution of the United Church of Canada, had been under way for several years. During 1956 the Presbyterian Church of Australia approved participation in the negotiations in the hope that a three-way union might be effected.

In India representatives of the Church of South India and of the Lutheran churches of the country decided to suspend their joint theological discussions for a year as a result of their inability to reach agreement on the question of the historic episcopate. At the same time the Joint Theological commission suggested the holding of four regional conferences in 1957 between the two groups.

In the fall of 1956 a delegation from the Protestant Episcopal Church in the U.S.A. spent six weeks studying the Church of South India for the purpose of preparing a report as to whether the Episcopal Church should establish intercommunion with the Church of South India. The Church of South India was formed in 1947 by a union of Anglican, Methodist, Presbyterian, Congregational and Reformed bodies.

The plans for the United Church in North India and Pakistan were not pressed pending further study of certain details of the project, which was designed to unite Anglican, Baptist, Methodist, Presbyterian and Congregational bodies. Certain revisions were proposed as a means of meeting objections to the plan.

In Indonesia the synod of the Church of Central Java voted to continue negotiations aimed at establishing an all-Javanese Christian synod. The proposed body would link the Church of East Java (Reformed) and the Church in North Central Java (Mennonite) with the Central Java Church. The aim of the new "ecumenical synod" would be to facilitate co-operation and united action between these churches.

Chronology: see CALENDAR OF EVENTS, 1956, pages 65-80.

Churches of Christ. The keynote among Churches of Christ in 1956 was well expressed in a new book about them entitled *The Church Is Building*. More than 1,000 church buildings were begun or enlarged in 1956. Since Churches of Christ are undenominational in nature and strictly congregational in government, exact figures on growth were not available. It was estimated that 500 new churches were started in 1956, making a total of 15,500 with approximately 1,650,000 members in the United States. Contributions continued to increase and were estimated at more than \$47,000,000 for evangelistic, benevolent and missionary causes. Sunday Bible school attendance continued to grow with thousands of churches having teacher training courses, many of them for the first time. Bible encampments multiplied.

Increased emphasis on missions was demonstrated by the Annual European Lectureship in Frankfurt, Ger., which was attended by workers from 13 nations. It was reported there that more than 100 new churches had been established in Europe since 1946. About 130 workers were being supported in 50 nations by churches in America.

Four new Christian colleges were launched during 1956: Lubbock Christian college, Lubbock, Tex.; York college, York, Neb.; Northeastern Christian college, Philadelphia, Pa., and Columbia Christian college, Portland, Ore. Central Christian college of Bartlesville, Okla., secured a new campus in Oklahoma City and announced plans to move in 1957. Ibaraki Christian college in Ibaraki, Japan, a fully accredited junior college eight years old, announced that its enrollment reached 600. Southwestern Christian college in Terrell, Tex., started a drive to enlarge its facilities. Plans for a new Christian college in Detroit, Mich., were announced.

A new home for orphans was opened in Valparaiso, Ind., and a new home for the aged in Romeo, Mich. A new magazine for preachers and elders, the *Minister's Monthly*, was begun in Nashville, Tenn., as well as a new daily devotional guide, *Power for Today*.

(M. N. Y.)

Church Membership. The latest information in 1956 concerning church membership in 258 religious bodies in continental United States, appearing in the

Yearbook of American Churches for 1957 (New York, 1956), indicated that there were 100,162,529 persons in 305,449 local churches or congregations. The figures were mainly for church years ending in 1955. This compared with 97,482,611 members reported in the *Yearbook* a year earlier. There were 82 religious bodies reporting more than 50,000 members each (see Table I), and their total membership was 98,571,528, or more than 98% of all members of religious bodies. The remaining 2% were found in 176 smaller bodies of the nation.

Church membership, officially reported, had been increasing for many years, as had also the proportion of church membership in the total population. In 1955 church members were 60.9% of the population. Since 1926, the date of the last adequate census of religious bodies made by the bureau of the census, church membership had increased more than 84%, while the estimated population increased over 40%.

However, nothing was known about church attendance or other participation, or the proportion of church members contributing money.

The Church of Christ, Scientist, does not report membership because of a regulation of that body which forbids the numbering of the people and the reporting of such statistics for publication.

In 1955 about 58% of church members in the U.S. were classified as Protestant, 33% Roman Catholic, 6% in Jewish congregations and 3% in all other bodies including Eastern Orthodox and Old Catholic.

Principal Religions of the World.—Since some of the religions are in no sense exclusive in their claims, some people may belong to as many as two or three different faiths. This is especially true in China and Japan. Any figures given must therefore be only estimates. There were in 1956 no reliable statistics as to what had happened to the religions of China under communism, nor was there any sure way of knowing how many in the U.S.S.R. still clung to their traditional faith. Protestant and Roman Catholic membership figures are not really comparable, since Roman Catholics count all baptized persons as members, while most Protestant groups count only those who "join the church."
(C. S. B.)

Civil Aeronautics Administration. During 1956, attention was focused on expansion and improvement of the air traffic control system of the United States, as the volume of operations by airline, military and executive aircraft continued to increase.

Scheduled Operations.—Revenue passenger-miles flown by U.S. domestic scheduled air carriers increased 15%, from 18,345,000,000 in fiscal 1955 to 21,129,000,000 in fiscal 1956. United States international scheduled carriers increased their revenue passenger-miles flown in the same period by 16%, from 4,067,000,000 to 4,737,000,000. Ton-miles of express carried by the domestic operators increased 15%, freight 12% and mail 6%, while international express and freight ton-miles increased 15% and mail 18%.

Airways.—To cope with the growing traffic, Civil Aeronautics Administration (CAA) submitted to congress a five-year federal airway plan, calling for expenditure of \$246,000,000 on new facilities. A total of \$75,000,000 was voted for the purpose, including a supplemental appropriation aimed at concentrating the program into three years.

Long-range radar with associated direct communications between controller and pilot was an essential element of the program. A start on long-range radar operations was made by relocating the New York facility to permanent quarters; installation of facilities at Chicago, Ill., and Norfolk, Va.; and negotiations with the military for use of defense radars in traffic control.

The number of channels available for direct communication between CAA controllers and pilots reached 70, with 136 additional programmed in the fiscal year which began July 1, 1956.

Other facilities added during the year included 16 omnidirectional radio ranges, 3 airport surveillance radars and 2 approach light systems. Improvements providing greater accuracy were made at approximately 80 existing omnidirectional ranges, and production was under way on equipment for 47 additional locations. Procurement of 30 additional approach light systems also had been initiated.

Four long-range navigational aids for transoceanic flights were in the process of installation; those at Atlantic City, N.J., and Nantucket Island, Mass., were near completion, with two sites in California at an earlier stage.

An extensive program of ultra-high frequency air-ground communications for military aircraft was carried on, with 1,700 channels installed at 500 CAA facilities.

A Central Altitude Reservation facility was established at Kansas City, Mo., to approve all military altitude reservation requests.

Training.—A highly accelerated program of training air traffic controllers was begun with a class of 80 newly employed personnel, the first of approximately 6,000 expected to be hired in the next five

years. In all fields, a total of 1,490 students, including CAA, military and foreign trainees, completed courses at the CAA Aeronautical centre, Oklahoma City, Okla., during fiscal 1956, an increase of 25% over fiscal 1955.

Aircraft Safety.—CAA issued certificates of approval for 6 new transport aircraft, 5 new types of helicopters, and 12 models in the small aircraft field. Work was begun on applications for type certification of the first two U.S. jet transports, the Boeing 707 and the Douglas DC-8; on the Lockheed Electra turboprop; and on the Fairchild M-185 jet-powered executive transport. Applications also were on hand from foreign manufacturers for approval of 14 transport aircraft, 9 of them turbine-powered; 3 personal types and 2 helicopters.

During fiscal 1956, 45 engine approvals were granted, and type certificates were issued for 52 propeller models.

Civil aircraft production, conducted under CAA safety controls, increased heavily. Aircraft output was 6,072, an increase of 60% over fiscal 1955; 9,582 engines were produced, a gain of 43%; and 14,000 propellers, a rise of 28%. (See also AIRCRAFT MANUFACTURE.)

Airmen.—During fiscal 1956, 72,031 airman certificates were issued, plus 48,999 student pilot applications processed. The first airline transport pilot rating in jet aircraft was issued.

CAA took a leading part in establishment of a training course for aerial applicator pilots at Texas A. and M. college.

Airports.—Federal aid allocations to communities for airport improvement were the largest in history during fiscal 1956. A program involving 205 airports and \$19,364,078 in federal funds was announced Aug. 10, 1955, followed by allocations of \$38,932,065 for 319 airports on Feb. 9, 1956, and a fiscal 1957 program of \$51,863,177 for 368 communities announced on June 12, 1956.

Planning and Development.—A CAA Jet Age Planning group was established to work with industry and government. It started operations with a preliminary list of 100 jet age problems developed as a result of a symposium called together in Jan. 1956.

Activity at the CAA Technical Development centre, Indianapolis, Ind., included tests of using traffic information obtained by microwave relay from a remote air defense radar, and of bird impact on the windshield of a new jet transport. The centre also established a branch in the Boston, Mass., area to work with military research facilities on possible integration of air defense and civil air traffic control systems.

International.—Considerable progress was made toward world-wide adoption of a common system of air navigation and traffic control, particularly in widespread installation of omnidirectional radio ranges. At the close of fiscal 1956, 60 such units were operating in countries other than the U.S. and Canada, with 95 more in various stages of procurement. Approximately \$3,000,000 in U.S. funds was obligated during fiscal 1956 to assist 12 nations in the purchase and installation of aviation ground aids.

CAA missions provided technical assistance in 24 nations, while 167 foreign nationals went to the U.S. for training under CAA supervision, an increase of 50% over 1955. In addition, 554 officials of foreign governments and air enterprises visited U.S. aviation facilities under CAA auspices. (See also AVIATION, CIVIL.)

(B. M. St.)

Civil Defense, U.S. A five-year educational campaign by the Federal Civil Defense administration to awaken the United States public to the dangers facing the nation and the need for taking steps to survive these dangers made its greatest advance in 1956. Polls indicated that 62% of the people were willing to spend two to three hours a week on

civil defense training over a period of six months, and that 64% of the people were willing to be drafted for such training.

Increased recognition of civil defense as a deterrent to war and its role in the over-all national defense program gave impetus to demands for a shift in basic civil defense responsibility from states and localities to the federal government.

Holifield Committee.—The military operations subcommittee of the house committee on government operations, headed by Representative Chet Holifield of California, after six months of staff studies and extensive public hearings, recommended that legislation be drafted to vest the basic responsibility for civil defense in the federal government, with the states and local units of government having important supporting roles.

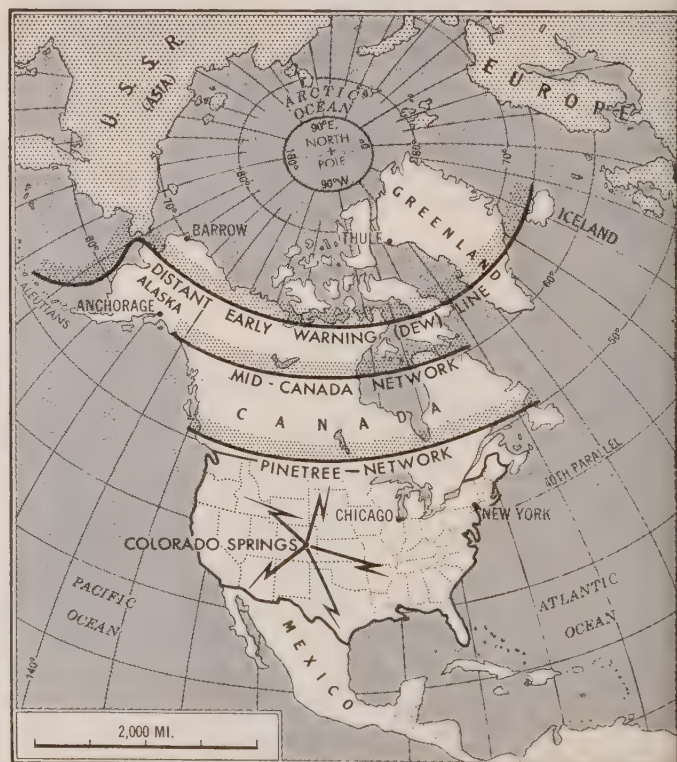

The committee also called for increased emphasis on a national shelter program and the establishment of a permanent department of civil defense, with cabinet rank.

President's Letter.—On July 17, 1956, in a letter to Federal Civil Defense Administrator Val Peterson, Pres. Dwight D. Eisenhower said he would suggest new legislation in his Jan. 1957 message to congress. The president expressed a desire to avoid federal pre-emption of all civil defense programs which were dependent upon widespread citizen participation, but added that "the exigencies of the present threat require vesting in the Federal Government a larger responsibility in our national plan of civil defense."

Basic Concept.—The basic concept of civil defense remained unchanged, and there was nothing in the foreseeable future to indicate that this concept was likely to change. The concept, as it had been since the recognition of the radioactive fall-out danger, was a balanced program of evacuation and shelter. It was recognized that neither evacuation nor shelter, in itself, could be advanced as a complete solution, but that the proper combination of shelter, evacuation and welfare held the best hope for saving lives in event of thermonuclear attack on the nation.

Survival Studies.—The FCDA pushed ahead in efforts to determine the balance of shelter and evacuation which seemed likely

RADAR DEFENSE CHAINS of the continental air defense command (CONAD) in the U.S. and Canada, with headquarters in Colorado Springs, Colo. Additional installations are placed along the Atlantic and Pacific coastlines

TEXAS TOWER, a U.S. air force radar detection platform off Cape Cod, Mass., which in 1956 went into full-time, 24-hour operation scanning the Atlantic for aircraft. This was the first of several towers planned for construction

to save the greatest number of lives in individual localities. This was the purpose of Survival Plan studies which were authorized by congress in 1955 and which were given high priority in FCDA's program. The first phase of the studies was undertaken in areas which included more than half the population of the nation. In September, state and city civil defense organizations, working in partnership with FCDA, moved for greater speed and efficiency in this direction, by agreeing to an interim phase calling for immediate development of operational survival plans.

Radiological Defense.—In another national program, President Eisenhower instructed FCDA to develop a national radiological defense plan to meet the threat of radioactive fall-out from nuclear weapons. As the first step, FCDA issued its largest research contract (\$591,600) for research leading toward such a plan. Other activities in this field included the expansion of weather bureau fall-out pattern predictions and negotiations with the department of defense for developing a program of aerial monitoring of radioactivity.

Operation "Alert."—The most successful of FCDA's annual training exercises was held July 20–26, with 32 government agencies and bureaus moving from Washington, D.C., to secret location sites and carrying on their activities just as if the simulated nuclear attack on 70 cities had been real. Public participation was more widespread than ever before with hundreds of communities staging extensive Operation "Alert" activities.

A feature of Operation "Alert" was the first nation-wide blackout of commercial radio and television broadcasting for a 15-minute test of the conelrad emergency broadcasting plan.

Civil Defense Week.—The first National Civil Defense week (Sept. 9–15) honoured civil defense workers and stimulated interest in the civil defense program. More than 300 tons of civil defense promotional materials were distributed, and radio and television programs carried the civil defense message to virtually every home.

Mr. Civil Defense, a cartoon character created by Al Capp, was adopted as a civil defense trademark and was widely used in Civil Defense week promotional material.

Natural Disasters.—Local civil defense organizations dealt with a variety of natural disasters and were credited with saving lives and reducing property damage. Civil defense organiza-

tions were called into action during spring tornadoes in midwestern and southern states.

Appropriations.—Congress appropriated a record \$93,560,000 to FCDA for the 1957 fiscal year, an increase of nearly \$25,000,000 over the previous year. Part of the additional appropriation was budgeted for establishment of a civil defense graduate college, scheduled to open in April 1957 at the FCDA national headquarters in Battle Creek, Mich.

Val Peterson, former governor of Nebraska, was administrator of FCDA. Lewis Berry of Cheboygan, Mich., was appointed by President Eisenhower as deputy administrator.

(V. PN.)

ENCYCLOPÆDIA BRITANNICA FILMS.—*Atomic Alert* (1951).

Civil Rights.

Events of 1956, to a measurable extent, accentuated national schisms over the issue of civil rights in the United States. This was particularly true in the area of racial discrimination but it extended into other fields, such as the government's internal security program, the 5th amendment, passports to foreign travel, immigration and naturalization, sedition, the jury room and censorship.

Civil rights, individual rights and civil liberties are interchangeable terms in a broad field. In one form or another they were issues in the presidential election of 1956, although not as dominant or decisive a factor as many had anticipated at the start of the political campaigns.

Integration of the schools continued to be the major issue in the civil rights field, as it had been since the supreme court's 1954 ruling that separation of pupils on the basis of colour deprived Negroes of the equal protection of the laws guaranteed to all citizens by the constitution. Resistance to this constitutional decision and implementing mandates resulted in civil disorders in some areas.

No new rulings were handed down by the supreme court in this field. Lower federal courts, however, issued integration orders pursuant to earlier judgments of the high tribunal and in some school districts voluntary compliance was undertaken. When Negroes sought to attend all-white schools in Tennessee, Texas, Kentucky and elsewhere, either after court orders or ac-

tion by local school authorities, community resistance became so menacing that national guard troops and Texas rangers were called in to preserve or restore order.

Legislatures in several southern states continued to seek formulas for circumventing the supreme court's decision and preserving their segregated school systems. Anticipated court tests of new legislation in this field failed to develop in 1956.

The platforms of both political parties contained planks on civil rights. Each party avoided an extreme position.

The Republicans accepted the supreme court's position that desegregation was to be brought about "with all deliberate speed" by means of federal district court orders, supported by gradual modification of community attitudes. They opposed any attempt to compel school integration by force.

The Democratic platform pledged continuation of efforts to eradicate discrimination based on race, religion or national origin. As did the Republicans, they rejected all proposals for the use of force "to interfere with the orderly determination of these matters by the courts." This was a less positive plank than had been favoured by Adlai E. Stevenson, who became the presidential nominee, and many northern members of the party, and it was accepted by southern opponents of integration.

Once the platforms had been ratified and the candidates nominated, neither party blazoned the issue in the campaign. Leading candidates displayed a marked tendency to talk of other things and the issue was soft-pedalled except in a few speeches aimed at particular groups of voters.

The supreme court handed down four major decisions in the civil rights field during the year. These were in the Communist party, Nelson, Slochower and Cole cases.

The Communist party case involved an order of the Subversive Activities Control board requiring the party to register with the attorney general as a Communist-action organization as defined by the Internal Security act of 1950. The court sent this case back to the board for further consideration of the effect upon the board's decision of testimony given by three witnesses whose credibility was questioned. The board complied by expunging the tainted testimony from the record and eventually the case would again reach the supreme court for final judgment.

The Nelson case involved the question of whether the Smith act pre-empted prosecution in the field of subversion and sedition for the federal government. The Pennsylvania supreme court had set aside the conviction of Steve Nelson, a Communist leader, under a state law on the ground that it had been invalidated by the federal enactment. The supreme court sustained the ruling of the Pennsylvania tribunal. The decision affected the laws of the majority of states. This led to widespread protests from state law enforcement officials, whose views were generally supported by the department of justice. Bills were introduced in congress to restore concurrent jurisdiction to the states but they did not reach the floor in either house.

In the Slochower case the supreme court held that invocation of the 5th amendment by a Brooklyn college professor who refused to answer questions asked at a congressional inquiry about his Communist activities or affiliations was not grounds for his arbitrary dismissal without a hearing. The ruling invalidated a provision of New York city's charter that made automatic the discharge of any municipal employee who refused on the grounds of possible self-incrimination to answer questions asked at any official inquiry pertaining to his official conduct.

The whole concept of "security" and "loyalty" as merged in Pres. Dwight D. Eisenhower's executive order establishing the administration's internal security program was jolted by the supreme court's ruling in the Cole case. Kendrick M. Cole was dismissed from a nonsensitive job in the Food and Drug administration as a security risk. The court ruled that public law 733

under which the executive order was issued authorized dismissals only in the interest of national security. It held that the term "national security" as used in the law applied only to persons in sensitive jobs. The effect of the ruling was to remove several million government employees from under the administration's employee-security program. Bills to overrule the effect of the decision were introduced in congress but did not emerge from committees.

Early in the second session of the 84th congress, which began in January, the administration submitted a civil rights program. It proposed, among other things, the creation of a commission to investigate allegations of a denial of civil rights; the establishment of a civil rights division, headed by an assistant attorney general, in the department of justice; to allow the justice department to seek federal injunctions in behalf of persons deprived of civil rights; to permit individual citizens to bypass state courts and go directly to the federal judiciary with complaints of a denial of civil rights; and to allow the justice department to bring civil suits against civil rights conspiracies.

An omnibus bill embodying major proposals of the administration was passed by the house of representatives on July 23 by a vote of 279 to 126. Faced with threats of a filibuster by southern senators that would block other legislation and delay adjournment, senate leaders did not bring up the bill and congress adjourned without senate action.

The only civil rights legislation actually enacted was a bill making it a crime by any means or device to record, listen to or observe proceedings of grand or petit juries while they were deliberating or voting. This followed disclosures that a microphone had been concealed in a jury room in Wichita, Kan., with the consent of the judge, by social scientists of The University of Chicago who were studying the workings of the jury system.

The eternal fight between those who would forbid the distribution or display of books or pictures or films considered obscene or harmful to public morals, especially to youth, and those who regard such restrictions as impairments of the rights of free speech and the press continued on both national and local levels.

Because the statutory definition of what constituted obscenity, vulgarity or immorality was vague, the supreme court invalidated the law under which Kansas had forbidden exhibition of the motion picture *The Moon Is Blue*.

In April the Rhode Island legislature passed a bill to ban the possession, sale or loan to anyone under 18 of motion pictures, still pictures, books, pamphlets or magazines deemed to contain pornographic material. Legislatures of New York, Michigan, Massachusetts, Kentucky and Virginia considered bills to broaden statutory definitions of obscenity, to prohibit the sale of certain kinds of books to minors or to increase penalties for violating obscenity statutes.

The Maryland court of appeals reversed a ruling of the state board of censorship which banned a film called *The Man With the Golden Arm* on the grounds that it would teach the use of narcotics. The court said it was more likely to deter their use.

In the academic field, Princeton university (N.J.) authorities refused to prohibit a speech by Alger Hiss, former state department official who served a prison term for perjury; over the opposition of the governor of the state, the University of New Hampshire (Durham) authorities authorized a lecture on the coming victory of socialism over capitalism by Paul M. Sweezy; and the University of Wisconsin (Madison) rejected efforts of the American Legion to censor materials in the university library and bar use of university facilities "to certain groups and speakers. (See also EDUCATION; LAW; NEGROES, AMERICAN.)

(L. A. H.)

Civil Service, U.S. At the end of June 1956 there were 2,396,356 civilian employees on the federal payroll, practically no change from June 30, 1955.

Legislation.—The major changes in the conditions of employment in the federal service made in 1956 were embodied in public law 854. This bill provided for increases in salary for heads of executive departments and some other top federal officials; changes in the terms of office for the U.S. civil service commissioners; increases in retirement benefits for civil service employees; and the establishment of additional scientific and professional positions. High lights of these changes are as follows:

Salary Increases.—The bill provided a salary of \$25,000 to all cabinet members; \$22,500 for the director of the bureau of the budget, the comptroller general, director of office of defense mobilization, undersecretary of state, the deputy secretary of defense; and \$22,000 to the secretaries of the army, navy and air force. Officials such as the commissioner of internal revenue were to receive \$21,000; chairmen of boards such as the Civil Aeronautics board \$20,500; while officials such as the administrator of civil aeronautics would receive \$20,000. The bill also increased the compensation of employees in the top four grades of the civil service (GS 17-20).

These increases were made to bring salaries of top government officials more in line with the responsibilities of their positions, but salaries were still far less than those paid for comparable jobs in private industry.

Appointment of Civil Service Commissioners.—In the past, whenever there was a change in administration, all members of the civil service commission resigned and the new president appointed three new members—two from his own party and one from the minority party. In the future, the term of office for each commissioner would be six years. The first appointments under the new law would be for two-, four- and six-year terms. Thereafter, as terms expired every two years, appointments would be made for six-year terms.

This change was proposed by the house post office and civil service committee as a means of giving continuity to the civil service commission.

Civil Service Retirement.—The feature of public law 854 that affected the greatest number of federal employees was the section that amended the Civil Service Retirement act. The bill called for an increase in the amount deducted from the employee's salary (6½%), but it also provided a more liberal formula for computing benefits, a lower reduction rate for retirement before 60, and higher annuities for children. Also, for the first time survivor annuities were available to dependent widowers.

More Scientific Positions.—The final portion of public law 854 authorized the establishment of additional scientific and professional positions—120 in the department of defense and 15 in the National Security agency—to strengthen research functions.

Loyalty-Security Program.—A six-to-three ruling of the U.S. supreme court, made on June 11, 1956, provided that only federal employees who held "sensitive" positions could be dismissed as security risks, and therefore the president had violated the law in setting up a security program which covered all government workers. The 1950 statute on which executive order 10450 was based was intended to cover only positions concerned with the national safety.

After the court decision, the justice department pledged full cooperation; it advised agencies to restore to duty any employees in nonsensitive positions who were on suspension because of security charges and directed them not to use security procedures on any such workers in the future.

Overseas Employees Brought Under Civil Service.—Since the close of World War II, the number of federal civilian employees stationed throughout the world had greatly increased. In June 1956 there were 204,027 such employees. In the past, career employees of the foreign service had been the only major group of overseas civilian employees who were covered by a merit system. Among other drawbacks to the policy of exempting overseas employees from civil service coverage was the fact that career civil servants in the continental United States could not be transferred to overseas assignments and retain their civil service rights and benefits. In 1956 the U.S. civil service commission worked out a method to bring overseas employees under the civil service system. Citizens working for the defense department overseas would be eligible for career status if they could meet the competitive standards for their job, if they had at least six months' satisfactory performance, and if they were recommended for status by their agency.

Senior Civil Service.—The civil service of the United States is organized generally on a specialist basis. This method of job classification has resulted in a high level of technical competence, but it has tended to impede the development of managerial talent capable of moving from one type of governmental program to another. In 1955 the second Hoover commission, seeking ways to improve the development of administrative skills in the government service, recommended the establishment of a so-called senior civil service which would be composed of a relatively small group of general administrators with wide and varied experience. This group would have personal rank similar to that of officers in the armed services, and their pay would be independent of the particular duties to which they were assigned at any given time.

Although some of the recommendations would require legislative action by congress, the U.S. civil service commission in 1956 took the initiative to establish certain features of the proposal on a tryout basis. A senior civil service development committee would be established initially to advise the president and the civil service commission. Standards would be set up for making appointments to the group of career executives who would serve in key positions immediately below the policy-making level.

Those selected would be given a presidential commission, be expected to maintain political neutrality and live up to a rigid code of ethics.

Clement, Frank Goad (1920—), U.S. governor and keynote speaker at the Democratic national convention in 1956, was born at Dickson, Tenn., on June 2. He took his law degree at Vanderbilt university, Nashville, Tenn., in 1942. From 1941 to 1943 he was with the federal bureau of investigation, then served in the army; from 1946 to 1950 he practised law at Nashville and Dickson, acting concurrently as chief counsel of the Tennessee state utilities commission. He was elected governor of Tennessee on the Democratic ticket in 1952 and re-elected in 1954—the second youngest governor in the state's history. Clement's administration was marked by reorganization of several of the state's departments, increased teacher salaries, partial desegregation of schools and a constitutional convention that abolished the state's poll tax.

By the beginning of his second term Clement was an important figure in the national Democratic political scene. Declining to run as Tennessee's "favourite son" candidate at the 1956 Demo-

GOV. FRANK CLEMENT delivering the keynote address at the Democratic national convention at Chicago, Ill., Aug. 13, 1956

cratic convention in Chicago, Ill., in deference to Sen. Estes Kefauver, Clement was selected as keynote speaker and was boomed for a time as vice-presidential nominee. In his keynote address on Aug. 13 at Chicago—a speech of almost evangelical tone and content—Clement attacked the Eisenhower administration in a “ten-count indictment against the defendant Republican party and its leadership.”

Cleveland. Cleveland, O., had a population of 914,808 by the federal census of 1950, making it the seventh most populous U.S. city. Cuyahoga county, which includes the city and most of its suburbs, had a 1950 population of 1,389,532. In 1956 the estimated population of the city was 944,000 and the county 1,540,000. Area of the city is 73.43 sq.mi. and the county 463 sq.mi.

Cleveland voters rejected at the November election a charter amendment calling for a 1.5 mill tax levy increase. Mayor Anthony J. Celebrezze declared the city would be in serious financial difficulties without the revenue from this levy increase and the council voted to re-submit the levy at a special election in Jan. 1957. The voters also defeated bond issues for bridges, a municipal court building, incinerators and freeways, but approved issues for streets, sewers and construction of a centre for the Pan-American games. Cleveland school district voters approved tax levies for operating expenses and construction of buildings. Democrats won all of the Cuyahoga county offices in the November election. They were: Joseph M. Sweeney, sheriff; Frank S. Day, recorder; Frank M. Brennan, treasurer; Albert S. Porter, engineer; Samuel R. Gerber, coroner; John F. Curry and Henry W. Speeth, commissioners; John T. Corrigan, prosecuting attorney; and Leonard F. Fuerst, clerk of common pleas court.

Labour troubles resulted in the suspension of publication of Cleveland's three daily newspapers on Nov. 1 and the city was without its local newspapers for 27 days.

On Feb. 1 the city began operating, and on April 28 it formally dedicated, its new \$3,500,000 passenger terminal at Cleveland Hopkins airport. The terminal was part of a \$22,000,000 airport improvement program. In May contracts totalling more than \$1,100,000 were let for construction of the north concourse. A record was set by Cleveland Hopkins airport in June 1956 when 168,000 passengers were logged in and out. During the first seven months of 1956 air freight shipped out of Cleveland totalled

17,608,031 lb., an increase of 728,303 lb. over the same period of 1955.

The city council gave its final approval on March 19 to putting fluorides in the city's drinking water, and the fluoridation of the water began July 2.

Winds of 70 m.p.h. struck the greater Cleveland area in a storm May 12, injuring 70 persons in the city and causing many millions of dollars of damage to property. Pres. Dwight D. Eisenhower on May 18 declared northern Ohio a major disaster area.

After years of planning by the city's urban renewal agency work began June 1, 1956, on the Garden Valley renewal project which would be a 247-ac. community with 1,200 housing units, schools, churches, parks, playgrounds and a shopping centre. For this project the federal government had extended a grant of \$3,941,024 and loans of \$4,676,875.

An increase in natural gas rates for homes of 5½ cents per 1,000 cu.ft. was approved by city council June 18 after extended negotiations with the East Ohio Gas Co. (R. H. Rs.)

Climate: see METEOROLOGY.

Clothing Industry. The apparel industry in the United States showed considerable improvement in 1955 as compared with 1954, and further improved its position in 1956. For 1955, employment was at a relatively high level, and this condition continued for the first three quarters of 1956. Approximately 800,000 workers (80% women) were employed in the industry, in factories located mostly east of the Mississippi river.

Table I.—U.S. Apparel Industry Sales, 1955, at Wholesale Prices

Type of clothing	Number of Firms	Total sales
Men's and boys' tailored clothing	1,073	\$1,500,503,000
Men's furnishings and work clothes	1,021	1,753,378,000
Sports outerwear and rain outerwear	411	403,210,000
Women's wear		
Dresses	3,375	2,880,731,000
Coats and suits	1,308	1,131,844,000
Intimate apparel	1,100	1,095,671,000
Total	8,288	8,765,337,000

Men's and Boys' Apparel.—Whereas the men's and boys' clothing industry operated at 71% of capacity in 1954, factory operations rose to 78% in 1955 and for the first three quarters of 1956 were at 81% of capacity.

In 1955, regular weight men's suits were produced in larger amounts than in 1954, but summer-weight suits made no progress because of the huge carry-over from the previous year.

Table II.—Men's Apparel Production, United States

	(In 000)	1956 8 mo.	1955 8 mo.	1955 total	1954 total
Men's suits (all fabrics and weights)	14,384	13,994	21,328	19,301	
Regular weight suits	10,517	10,543	16,286	14,277	
Total summer weight suits (all fabrics)	3,867	3,451	5,042	5,024	
Summer weight (50% or more wool)	1,410	1,199	1,788	1,908	
Summer weight (less than 50% wool)	2,457	2,252	3,254	3,116	
Topcoats and overcoats	3,415	3,172	4,966	4,245	
Pants (all fabrics)	41,638	41,940	61,620	55,176	
Pants (less than 50% wool)	24,048	25,248	37,020	35,496	
Pants (50% or more wool)	17,590	16,692	24,600	19,680	

Of particular interest during 1956 was the growing popularity of man-made fibres in summer-weight suits, and special finishes had been added as features to such garments. The dacron and wool summer suits, which reduced wrinkling, were predominant in the lighter weight garments during the first half of 1956 and the so-called “wash and wear” fabrics became increasingly popular.

In general, there was a growing trend in the men's clothing industry toward lighter weight fabrics in wool for all year use, and in blends of wool and man-made fabrics for summer wear. The charcoal grays, popular in 1955, declined in popularity in

1956. The "Ivy" type suits with the natural shoulder, made in the three-button model, grew increasingly in demand both in men's clothing and in boys' and students' clothing.

Men's sportswear became increasingly conservative in styling. The sport coat that previously had had an informal look now assembled, to a great extent, the regular tailored suit jacket. The three-button models were growing in popularity at the expense of the two-button sports coats.

During the first eight months of 1956 production of dress shirts was about the same as in the comparable period of 1955.

On the other hand, sport shirts showed a substantial increase, primarily those made of cotton. As in 1955, there was a sharp reduction in the production of sport shirts made of fabrics other than cotton.

Women's Apparel.—In the women's apparel industry, the production of suits declined during the first half of 1956, although women's coats showed an increase. Production of lower priced dresses dropped sharply, as did that of blouses.

CHILDREN'S PARTY CLOTHES of 1956. The boy is wearing a black velveteen suit and the girl a dotted white dress with black trimming and belt

Labour Developments.—In the men's tailored clothing field, manufacturers gave a 12½ cents an hour increase to all their unionized workers, and additional social benefits. In the shirt and work clothes field, union workers received ten cents an hour increase and additional social benefits. Labour-management relations in the apparel field as a whole continued on a friendly basis.

(H. A. CN.)

Coal. Of the 18 major coal-producing countries that supplied the record-breaking total of 2,356,000,000 short tons of coal in 1955, as shown in Table I, four countries alone contributed 69%. India expected to increase its output to 60,000,000 tons within a few years, to implement the expanding steel output in that country.

United States.—The coal industry shared in the general upswing in industrial activity in 1955 and produced 19.9% more coal than in 1954. The number of coal mines increased from 6,000 in 1954 to 6,500 in 1955. More than 45,000,000 tons more coal was mechanically cleaned in 1955 than in the previous year. The fuel efficiency rate continued to improve. Based on data of the Federal Power commission, as of 1955, 0.95 lb. of coal was consumed to provide one kilowatt-hour of electric power compared with 0.99 lb. per kilowatt-hour in 1954. The gain in efficiency since 1919 had been 70.3%.

Anthracite.—Production of anthracite coal in 1955 was 8% smaller than in 1954. Under a state-federal \$17,000,000 appropriation in 1955 for floodwater control in the Pennsylvania anthracite field, two projects were approved in 1956. Additional pumping equipment was provided to one mine in the northern anthracite area and one in the southern anthracite area of the

*Preliminary. †Others, in 1955, covers output of Alaska and 13 states, including North Dakota (2,980,000 tons lignite), Missouri (2,380,000 tons bituminous), Oklahoma (2,055,000 tons), Kansas (1,600,000 tons), Iowa (1,435,000 tons) and Montana (1,192,000 tons bituminous and 18,000 tons lignite).

state. The money was to be used solely for construction and not for operating and maintaining the completed project, and was to remain available until spent.

More than 40 tons of water were being pumped for every ton of anthracite produced. Aside from this program, research was intensified to extend the use of anthracite as a blast-furnace fuel. Anthracite does not coke, but it has long been used successfully for metallurgical purposes. It has some special advantages, but the high cost of production has made it unattractive commercially.

Bituminous.—Output of bituminous coal in the United States was maintained at a high rate during 1956 despite competitive inroads of other fuels, chiefly oil and gas. However, with in-

OFFSHORE COALING STATION in the Firth of Forth, Scotland. Exploratory bores beneath the water in 1956 indicated coal beds which were estimated to have a possible yield of 200,000,000 tons of coal. Mining would be accomplished by drilling underwater tunnels from the shore

creased demands in prospect for coal, scientific and economic research was extended.

In May 1956 a report by the U.S. bureau of mines gave results of the study made by the bureau in co-operation with industry. Important data were obtained on coal preparation and on improved methods of washing, burning, coking and gasifying bituminous coal. The bureau and the Atomic Energy commission began research to determine if nuclear energy can be used successfully in gasifying bituminous coal.

Looking to greater utilization of lignite, an abundant fuel in the United States, a broad program previewed power requirements for crushing and pulverizing. Recent new mines in Texas had increased lignite output by 1,000,000 tons per year.

In the first half of 1956 anthracite output was 8% above the 1955 rate and bituminous output was more than 18% higher. Data in this article on coal were obtained from the U.S. bureau of mines. (F. E. H.; B. B. M.)

Coast and Geodetic Survey, U.S. During 1956 this bureau of the department of commerce continued its program of services essential to marine and air navigation, to mapping and other engineering work, and to the development of the natural resources of the country. Its work embraces hydrographic and topographic surveys of the coastal regions of the United States and its possessions; the observation and analysis of tides and currents to furnish datum planes to engineers and tide and current predictions to mariners; the determination of geographical positions and elevations in the interior of the country to co-ordinate the coastal surveys and to provide a framework for mapping and other engineering work; observations of the earth's magnetism in all parts of the country to provide magnetic information essential to the mariner, aviator, land surveyor, radio engineer and others; seismological observations and investigations to furnish data for the design of earthquake-resistant structures; and the compilation and distribution of nautical and aeronautical charts to meet the needs of marine and air commerce.

Seventeen ships and two shore-based parties continued making basic hydrographic surveys along the coasts of the United States and Alaska during 1956. Along the Atlantic coast the program of wire dragging the sea lanes to locate wrecks caused by enemy submarine action during World War II was continued. Fifty-nine wrecks were located between the Virginia capes and Cape Fear, N.C. The electronically controlled hydrographic surveys of Browns bank and the northeastern part of the gulf of Maine were completed.

Topographic mapping by photogrammetric methods was continued along coastal areas of the United States and Alaska as part of the bureau's charting program. A special map of Providence, R.I., was prepared for use in storm-water inundation studies. This is a pilot project to determine the type of map information needed for evacuation when storm waters are forecast, for underwriting storm-damage insurance and for preventing storm damage. Under the airport mapping program, photographs were taken of 45 airports, field surveys completed at 39 airports and 13 new airport obstruction plans published, bringing the total number issued to date to 514.

As part of the tidal program of the bureau, a system of control tide stations was maintained at selected locations along the coasts of the United States and on some islands in the western Pacific. New stations were established at Panama City, Fla., and at Christmas Island in the Pacific ocean. A project to determine storm effects on water levels at tide stations was undertaken in connection with a hurricane warning project being developed by the United States weather bureau. A special current survey was made of Gloucester harbour, Mass., in connection

with a study being made by that city for the control of pollution and for beach preservation.

The geodetic networks of control in the United States were expanded to provide additional geographic positions and elevations for the national mapping program and for other engineering uses. Ground settlement studies were made in Arkansas and California. In the San Joaquin valley, Calif., the maximum rate of settlement reached $1\frac{3}{4}$ ft. per year. In Alaska, one of the principal accomplishments was the completion of several hundred miles of triangulation in the northern part. This completed the basic framework of triangulation in the territory. The adjustment of the northern Alaska triangulation was the largest ever accomplished by a single set of simultaneous equations. Astro-logic observations were made in the United States along the 5th parallel as a continuation of the study of the deviation of the geoid from the spheroid along a transcontinental profile.

In furtherance of the magnetic survey of the United States, observations were made at 39 stations in the United States and Alaska (13 were repeat stations) and at 6 observatories. A new magnetic observatory and laboratory near Fredericksburg, Va., to replace the old Cheltenham, Md., installation, was dedicated on May 23, 1956.

As part of its seismological work, the bureau operated 71 strong-motion seismographs in six states of the western seismic region. It also co-operated in maintaining stations in seven Central and South American countries. During the year, the bureau located 1,113 earthquakes throughout the world through its co-operative program with universities and institutions and several hundred independent stations. Seven of these were in the Pacific area and were located within an hour of occurrence for the seismic sea wave warning service. No major earthquake occurred in the United States during 1956.

More than 47,000,000 copies of nautical and aeronautical charts and related data were published—a greater volume than any previous year. A total of 806 nautical charts and 1,533 aeronautical charts were available in different series to meet the needs of marine and air navigation. A recompilation was begun of the Sectional series of aeronautical charts in order to incorporate new concepts of what the visual flight operator needs. A recompilation was also begun of all civil and military instrument approach and landing charts. (See also OCEANOGRAPHY; SEISMOLOGY.)

(H. A. Ko.)

Coast Guard, U.S.

To the U.S. coast guard has been given the responsibility for the maintenance of safety and order on the high seas and navigable waters under the jurisdiction of the United States. The primary goal of coast guard duties is to prevent avoidable loss of life and property resulting from unsafe or illegal practices. To achieve this objective, the coast guard enforces federal maritime laws, operates aids to navigation, promotes efficiency in the operation of merchant vessels and motorboats, and rescues and aids distressed persons, vessels and aircraft.

The maintenance of safety and order in maritime activity is not limited to the strict enforcement of laws, but includes a program of education for shipowners, merchant vessel crews and boatmen, and the enlistment of their co-operation and self-regulation in the prevention of marine casualties.

Administered by the commandant from headquarters in Washington, D.C., the coast guard is a military organization and a branch of the armed forces. It operates under the treasury department except in time of war or when the president so directs, when it becomes a specialized service in the navy.

Activities of the coast guard in the fiscal year 1956 were aimed primarily at carrying out its historic peacetime mission: maintenance of safety and order on the high seas and navigable waters

ANTARCTIC MASCOT, a four-foot emperor penguin that became so interested in the cargo unloading process of the icebreaker "Eastwind" during Operation "Deepfreeze I" in June 1956 that he was given a U.S. coast guard mascot rating by the crewmen

of the United States. Expansion of the port security program resulted in the commissioning of seven cutters. One reactivated cutter was added to the ocean weather station program and a sailing vessel was accepted and commissioned by the coast guard for training purposes at the Coast Guard academy, New London, Conn. Funds available rose from \$208,705,170 to \$223,538,344. Military personnel strength increased from 28,321 in 1955 to 28,441 in 1956, while authorized civilian employees totalled 4,769 as compared with 5,082 in the previous year.

Throughout the year, the coast guard continued to carry out its regular duties of maritime law enforcement. These functions included promotion of safety and efficiency in the merchant marine; inspection of merchant vessels and enforcement of regulations for motorboats; operation of aids to navigation, including lighthouses, buoys and electronic signals; protection of life and property at sea; rescue and aid of persons, vessels and aircraft in distress; operation of ocean stations and the international ice patrol; and maintenance of a state of military preparedness for national emergencies.

The following statistics indicate the volume of law-enforcement activity, but not of preventive activity, taken by the coast guard during the year: vessels and motorboats boarded, 129,453; reports of violations of the Motorboat act, 11,245; reports of violations of port security regulations, 290; permits to load or discharge explosives, 1,054; total tonnage of explosives covered by permits, 362,079; explosives loadings supervised, 793; merchant mariners' documents issued bearing evidence of security clearance, 20,813; waterfront workers screened for security, 20,760, and total rejected as poor security risks, 50.

The coast guard also helped to enforce the Oil Pollution act, anchorage regulations, laws relating to internal revenue, customs, immigration, quarantine and the conservation and protection

of wildlife and fisheries.

Facilities used in assistance operations included a system of 141 lifeboat stations, together with communications centres, bases, vessels and aircraft at strategic points along the coast and inland waterways. Assistance rendered during the year is summarized in the following statistics: assistance calls responded to, 19,281; value of vessels and aircraft assisted (including cargoes), \$851,483,600; lives saved or persons rescued from peril, 3,769; vessels towed, 8,024; vessels refloated, 1,112; miles disabled vessels towed, 83,551.

During the year 3,045 marine casualties were reported, of which 2,459 were the subject of detailed investigations. Four hundred and six persons lost their lives in 201 of the casualties reported. Only one passenger lost his life as a result of a casualty to an inspected passenger vessel during the year.

The coast guard worked in close association with the American Boat and Yacht council in fiscal 1956. The objective of the council is to foster self-regulation and to promote recommended practices and engineering standards for improving the design, construction, equipage and maintenance of small craft.

The coast guard completed 5,886 inspections of merchant vessels with a gross tonnage of 17,897,958 tons; made dry-dock examinations of 4,538 vessels with a total tonnage of 15,187,509 tons; carried out 20,292 miscellaneous inspections; numbered 384,965 undocumented vessels; and reviewed plans for 17,305 merchant vessels.

As of June 30, 1956, there were 39,335 aids to navigation maintained in the United States, its territories and possessions, the Trust Territory of the Pacific Islands and at overseas military bases. These aids included 49 loran stations, 373 manned light stations and 33 lightships.

The coast guard maintained four ocean stations in the North Atlantic and two in the Pacific throughout the year. Ocean station vessels provided search and rescue, communications, air navigation facilities and meteorological services in the ocean areas regularly traversed by aircraft of the United States and other co-operating governments.

For the sixth consecutive year the international ice patrol was carried out by aerial reconnaissance so that continuous use of surface patrols was not required.

The coast guard's larger ships consisted of 178 cutters and buoy tenders of various types. The number of fixed and rotary-wing aircraft in operation ranged from 122 to 126. Coast guard reserve strength was 3,581 officers and 18,191 enlisted personnel.

The coast guard auxiliary, a nonmilitary organization of volunteers, was active in more than 400 communities in the promotion of safety and efficiency in the operation of small boats. Its 12,676 members examined 36,885 motorboats, patrolled 316 regattas and answered 2,289 calls for assistance.

Public health service personnel on duty with the coast guard included 45 dental officers, 37 medical officers, 8 nurses, 1 scientist officer and 1 sanitary engineer. (A. C. Rd.)

Cobalt: see MINERAL AND METAL PRODUCTION AND PRICES.

Cocoa (Cacao). World production of cocoa beans was preliminarily estimated for 1956-57 at slightly more than 800,000 long tons, as compared with a record 835,000 long tons in 1955-56, 796,000 long tons in 1954-55 and 753,000 long tons in 1953-54. As usual, practically all of the crop moved into the export market, largely to western Europe and the United States. World consumption was about 770,000 long tons, rising about 10% during 1955-56 but leaving substantial inventory stocks.

The steep price decline in cocoa beans which began from a

peak level of nearly 73 cents in 1954 was arrested in 1956; the price for Accra declined from about 32 cents per pound in January to about 23 cents in April, then fluctuated below 30 cents

World Cacao Production by Leading Areas
(In 000,000 lb.)

Area	1955-56	Average 1945-46 to 1949-50	Average 1935-36 to 1939-40
Gold Coast	511	512	601
Brazil	348	284	261
Nigeria	251	223	211
Ivory Coast	149	94	111
French Cameroun	141	91	51
Other	401	312	221
Total	1,801	1,516	1,581

Prices to producers were lowered about one-fourth. The fall in cocoa bean prices was reported as resulting in less thorough harvesting and less care being given to older trees, with newer plantings compensating only in part. Disease and pest control efforts continued as did accelerated planting programs, particularly in the Caribbean and southeast Asia areas. (J. K. R.)

Coffee. Early season estimates of the total world green coffee crop for 1956-57 showed an extraordinarily wide variance; the United States department of agriculture predicted a crop of 47,355,000 bags (of 132 lb. each), of which 36,535,000 bags were expected to be exported; officials of the Brazilian Coffee institute indicated a crop of only 32,000,000 bags, stating that rains had reduced Brazilian expectations to little more than 10,000,000 bags against the U.S. department of agriculture estimate of 15,500,000 bags. The United Nations' Food and Agriculture organization first indicated that world production would probably be lower than in 1955-56, but later announced that it would reach a new record level of about 44,000,000 bags, 7% more than in 1955-56.

Coffee Production (Green) in the Principal Producing Countries
(In 000 bags, 132.3 lb. each)

*Forecast.

Source: U.S. Department of Agriculture, *Foreign Crops and Markets*, vol. 71, no. 2, p. 5.

Probable world consumption was variously estimated at from 34,000,000 to 37,000,000 bags.

World exports of green coffee during 1955 were 34,025,000 bags, about 16% higher than the 29,287,000 bags of the previous year. Of that total, 13,696,000 bags were from Brazil, as compared with 10,918,000 bags the previous year. Africa exported 7,131,000 bags, as compared with 5,754,000 bags the year before. The U.S. imported 19,565,000 bags, against 16,427,000 bags in 1954. U.S. imports during the first half of 1956 were 11,238,000 bags, the highest number since 1946 and 25% larger than for the first half of 1955.

U.S. inventories were increased by more than 1,000,000 bags. Inventories accumulated in Brazil and in Africa, particularly of lower grades. Although an over-all surplus of several million bags was indicated, mild types, largely from middle America, were believed sufficient to meet consumption but not to rebuild inventories of this type.

A price decline in coffee was widely anticipated as the U.S. inventory situation improved and a substantial surplus accumulated in Brazil from the large 1955-56 crop. Instead, there was

the paradox of a strong and rising market in the face of easier supplies. Some Brazilian coffee contracts on the New York market fluctuated between 56 and 61 cents per pound, or about 10 cents higher than during the previous year. U.S. retail prices for vacuum-packed coffee were increased to more than \$1.00 per pound, without meeting apparently much of the consumer resistance anticipated in some places. The Hamburg Coffee exchange, once second only to that of New York, was formally reopened in March, after a suspension of nearly 17 years.

The Economic and Social Council of the Organization of American States proposed, but did not secure during 1956, the adoption of an international agreement designed to stabilize coffee prices. The U.S. announced that it was unable to lead in negotiating such an agreement or to become a participant in it.

The "coffee break" became further entrenched as a fringe benefit and morale booster among U.S. workers. The retail battle between the instant or soluble form and the ground berry for brewing continued unabated, with soluble types accounting for about 15% of the coffee berries used, a 50% increase since 1954.

(J. K. R.)

Coinage. United States government mints manufactured 1,419,850,542 domestic and foreign coins during the U.S. government fiscal year ended June 30, 1956. Details are shown in the tables.

Table I.—U.S. Coins Manufactured, Fiscal Year 1956

Denomination	Number of pieces	Face value	Metallic composition
Half dollars	2,424,654	\$ 1,212,327.00	Silver
Quarter dollars	42,769,454	10,692,363.50	Silver
Dimes	120,429,954	12,042,995.40	Silver
Five-cent pieces	40,872,340	2,043,617.00	Cupronickel
One-cent pieces	1,207,249,140	12,072,491.40	Bronze
Total	1,413,745,542	\$38,063,794.30	

Table II.—Foreign Coins Manufactured by U.S. Mints, Fiscal Year 1956

Government	Number of pieces
Dominican Republic	35,000
Honduras	6,070,000
Total	6,105,000

The bureau of the mint in 1956 included the office of the director in Washington, D.C.; the mints located in Philadelphia, Pa., Denver, Colo., and San Francisco, Calif., the latter currently operating only as a refinery and assay office; the Fort Knox, Ky., gold bullion depository; the West Point, N.Y., silver bullion depository; and the New York assay office.

In addition to coinage production, the bureau directs shipment of domestic coins for circulation from the mints and among the Federal Reserve banks; has custody of the government's monetary metals, valued at many billions of dollars; acquires, assays and refines gold and silver bullion; administers the issuance of treasury licenses for the acquisition, ownership, possession, use and exportation of gold for industrial, professional and artistic purposes; and produces historic medals and medals and other decorations for U.S. government agencies. (L. Hd.)

Coke. The United States bureau of mines data (Tables I and II) show that 1955 was a banner year for the world coke-producing countries.

United States.—In 1955 U.S. coke production followed the uptrend in industrial activity which began in the latter part of 1954. In the last two decades the quantity of coke consumed in making iron and steel rose steadily and that for domestic heating declined. As of about 1935, about 65% of total coke was used in the iron industries, 15% for all other industrial plants and 20% for domestic heating. In 1955 the proportions were respectively 94%, 5% and 1%. Less than 1% of all coke and breeze produced was exported. Coke output in the first half of 1956 was 39,895,410 tons or 10% more than in the 1955 period.

(F. E. H.; B. B. M.)

*Revised.

Coldwell, Major James (1888—), Canadian political leader. was born at Seaton, Eng., Dec. 2. He attended University college, Exeter, emigrated to Canada in 1910, and for 20 years was an educationist in Regina, Sask., where he also served on the city council, 1922–32, and was provincial leader of the Saskatchewan Farmer-Labour party, 1932–35. In 1935 he was elected to the house of commons for Rosetown-Biggar, Sask., for the Co-operative Commonwealth federation, and has been re-elected since in each general election. In 1942 he was named president and party leader of the C.C.F. In 1945 he was a member of the Canadian delegation to the United Nations conference at San Francisco, and in 1953 he was named a parliamentary observer on the Canadian delegation to the UN. He was the author of *Left Turn, Canada*.

During the 1956 session of parliament, he called for recognition of the Peking government of China and its admission to the United Nations, with Formosa to be neutralized and placed under the United Nations. As a supporter of the admission of a rearmmed German Federal Republic to the North Atlantic Treaty organization, he still expressed doubts about the difficulties of building controls which German militarism could not circumvent, and the lessening value in a hydrogen-bomb era of 12 German divisions. He urged that Canada "should bring about a conference of the powers which have nuclear weapons with a view first to ending these dangerous experiments." With regard to the "cold war," he called for greater efforts to remove the causes of disease, famine and poverty and to raise the standards of living throughout the world.

For the first time, he presented a draft of an amendment to the Canadian constitution, the British North America act, providing for a Canadian bill of rights to guarantee the rights of all Canadians in legal language. He urged an unearned capital-gains tax so that this capital might be diverted into social investment, and an increase in the personal income-tax exemptions accompanied by an increase in corporation income tax.

(M. L. S.)

Colleges and Universities: see UNIVERSITIES AND COLLEGES.

Colombia. A republic situated in northwestern South America adjoining the Isthmus of Panamá, Colombia is the only South American country with both Caribbean and Pacific coast lines. Area 439,519 sq.mi.; pop. (1951 census) 11,548,172; (1956 est.) 12,939,000. Approximately 68%

DISASTER AT CALI, COLOMBIA. A view of the section of the city in which a dynamite explosion razed eight blocks, killing more than 1,200 persons, Aug. 7, 1956

of the population is classified as mixed blood, 20% as white, 7% as Indian and 5% as Negro. Most Colombians live in the highlands and mountain valleys of the interior. The capital is Bogotá (1951 census) 638,562, (1954 est.) 765,360. Other major cities (with 1951 census, 1954 est. in parentheses) are Barranquilla, 276,199 (324,700); Bucaramanga 102,887 (136,170); Cali 241,357 (365,800); Cartagena, 111,291 (142,800); Cúcuta, 70,375 (107,820); Ibagué, 54,347 (110,900); Manizales, 88,893 (138,680); Medellín, 328,294 (431,380); Neiva, 33,040 (55,540); Pasto, 48,853 (91,520); Popayán, 31,866 (49,440); Santa Marta, 37,005 (51,660); and Tunja, 23,008. Language: Spanish. Religion: predominantly Roman Catholic. President in 1956: Lieut. Gen. Gustavo Rojas Pinilla.

History.—The government of Pres. Gustavo Rojas Pinilla grew increasingly authoritarian during 1956. These authoritarian aspects of the regime were clearly demonstrated in its treatment of the Colombian press. Confiscatory back taxes, fines and newsprint storage charges were levied against the Liberal newspapers *El Independiente* and *Intermedio* (formerly *El Espectador* and *El Tiempo*) of Bogotá and the Conservative *El Colombiano* of Medellín in the amounts of 350,000, 2,500,000, and 600,000 pesos, respectively. *El Independiente* later suspended operation rather than print the government version of a raid by secret police on the national Liberal party headquarters. In addition to violating freedom of the press, Rojas Pinilla also inaugurated a government newspaper, *Diario Oficial*, which was said to have the most modern printing plant in Latin America.

In an effort to counter the growing dissatisfaction with his regime, Rojas Pinilla on June 13, the third anniversary of his assuming power, inaugurated a Third Force movement of workers, soldiers, farmers and other groups. This movement was a failure almost from its inception since it aroused little popular support and invoked the displeasure of the Catholic Church.

Alberto Lleras Camargo, who survived an apparent assassination attempt in January, was elected head of the Liberal party in March. In July, in Benidorm, Spain, Lleras signed an agree-

ment with Colombia's most influential Conservative, Laureano Gómez, calling for the unification of Liberals and Conservatives against Rojas Pinilla. This pact was thought to be a major factor in the September resignation of Rojas Pinilla's entire cabinet. The president reappointed the four military members and filled the remaining nine vacancies with comparatively unknown Conservative civilians.

A downtown section of the city of Cali was rocked by the explosion of seven truck loads of dynamite and munitions which claimed the lives of more than 1,200 people and caused perhaps \$40,000,000 damage.

On Oct. 11, Rojas Pinilla called the National Constituent assembly into session for the first time in two years. Although called principally for

the purpose of making into law the decrees promulgated by the government, the delegates unleashed violent attacks on Rojas Pinilla and his government and moved that Laureano Gómez be reelected in the assembly. These happenings were widely publicized by the press which enjoyed a long-unaccustomed freedom from censorship.

No small part of Rojas Pinilla's political difficulties stemmed from his economic policy. Although enjoying relatively high coffee prices, Colombia's foreign trade debt in October was approximately \$345,000,000; the peso had fallen from the free market rate of 3.75 per dollar in Oct. 1955 to 5.12 per dollar in Oct. 1956; and reserves had declined to a dangerous low of \$91,000,000. As a result, Colombia's credit rating was greatly damaged and the progress of industrialization and of transportation development was slowed. (R. HN.)

Education.—In 1954 a total of 16,784 schools reported 1,293,606 students and 44,467 teachers. Reporting schools included 14,744 primary schools with 1,125,350 students and 28,939 teachers; 620 secondary schools, 69,947 students; 218 commercial schools, 17,379 students; 99 normal schools, 9,869 students. There were 28 universities comprising 8 faculties and 22 institutes and schools of higher learning with a total of 11,996 students and 2,449 teachers.

Finance.—The monetary unit is the peso, valued at 39.84 cents U.S. currency, basic rate, during 1956 and at 20.24 cents, free rate, on July 31, 1956. The national budget for 1956 totalled 1,331,472,000 pesos. Actual revenue in 1955 (including proceeds of loans) was 2,304,619,500 pesos; expenditure was 2,264,609,000 pesos. The internal debt on May 31, 1956, was 443,313,000 pesos and the external debt (excluding interest) the equivalent of 211,053,000 pesos. The U.S. department of commerce estimated U.S. direct private investments in 1955 at \$272,000,000, of which \$105,000,000 represented petroleum investments. Currency in circulation (April 30, 1956) totalled 652,000,000 pesos; demand deposits, 1,385,000,000 pesos.

Trade and Communications.—Exports in 1955 (excluding gold) totalled 1,459,742,000 pesos; imports, 1,678,153,000 pesos. Leading exports were coffee (83%), petroleum (11%) and bananas (3%). Leading customers were the U.S. (74%), Germany (8%), the Netherlands Antilles (5%), Sweden (2%) and the Netherlands (2%); leading suppliers, the U.S. (63%), Germany (10%), the U.K. (4%), France (3%) and Canada (3%).

Railroads (1954) totalled 1,854 mi.; in 1955, they carried 11,010,952 passengers and 5,026,799 metric tons of freight. **Highways** (1954) totalled about 15,365 mi. Registered motor vehicles (Jan. 1, 1955) included 58,761 automobiles, 58,007 trucks and 10,542 buses. In 1955 national air lines carried 1,090,408 passengers and 125,096 tons of cargo. **Telephones** (Jan. 1, 1955) numbered 143,501.

Agriculture.—Coffee production in the 1955-56 season (preliminary figures) totalled 7,200,000 bags of 132 lb. each. Exports in 1955 were 5,867,229 bags, of which 4,800,444 bags went to the U.S. and 419,121 bags to Germany. Preliminary production estimates for other crops in 1955-56 included rice (rough) 650,000,000 lb.; cotton 103,000 bales of

oo lb. gross weight; sugar (centrifugal) 284,000 metric tons; sugar (panela) 600,000 tons; wheat (1954-55) 146,000 tons; maize (1954-55) 13,000 tons; cacao 28,660,000 lb.; tobacco (year 1955) 65,036,000 lb. banana exports in 1955 were 9,154,709 stems, of which 4,146,451 stems went to Germany and 2,671,582 stems to the U.S. In 1951 there were an estimated 15,512,000 cattle, 2,782,000 hogs, 1,298,000 horses, 1,339,000 sheep and 637,000 goats.

Manufactures.—According to the 1953 census of manufacturing industries Colombia had 8,217 manufacturing enterprises (5 or more workers) with 152,106 employees and annual gross production valued at 3,267,400 pesos. Most important by value of production were foodstuffs (2%), beverages (12%), textiles (11%), shoes and apparel (8%) and chemicals (5%). Production (1955) included cement 1,045,537 metric tons and electric energy (primarily for public use) 1,179,600,000 kwhr.

Minerals.—Production in 1955 included gold 380,826 troy oz.; silver 12,037 oz.; platinum (exports) 27,526 oz.; terrestrial salt 175,134 metric tons. Crude petroleum production was 39,711,000 bbl.; exports were 25,10,251 bbl., of which 12,074,315 bbl. went to the Netherlands Antilles (for refining) and 8,276,465 bbl. to the U.S. Refined products included 29,000 bbl. of gasoline and 6,978,000 bbl. of fuel and diesel oil.

(J. W. Mw.)

ENCYCLOPÆDIA BRITANNICA FILMS.—*Colombia and Venezuela* (1945).

Colorado. A Rocky mountain state in the west central part of the United States. Colorado has a mean elevation above sea level of 6,800 ft., the highest of any state in the nation. Admitted to the union in 1876 as the 38th state, it is generally known as the "Centennial state" in celebration of the 100th anniversary of the signing of the Declaration of Independence. The area of 104,247 sq.mi. includes 325 sq.mi. of water. The United States owns 34.5% of the total land area and 59.3% is privately owned. The remainder belongs to state, county and municipal governments.

The U.S. bureau of the census population estimate for Colorado as of July 1, 1956, was 1,612,000. The 1950 census figure was 1,325,089. Of the population 62.7% is urban; 37.3% rural; 4.4% native white; 4.5% foreign-born white; 1.5% Negro; 1.6% other. The capital, Denver, had a 1950 population of 415,000. The Denver 1955 estimate was 498,000. Other large cities (1950 census) are Pueblo, 63,685; Colorado Springs, 45,427; Greeley, 20,354.

History.—The 1956 second regular session of the 40th general assembly convened in Denver Jan. 4, 1956, and adjourned Feb. 10, 1956. Several notable bills were passed. House bill 65 created a new division of rehabilitation for the blind to provide industrial education, vocational training and employment of blind persons. Because of exceptionally dry conditions of the past several years, house bills 82 and 126 were of interest. The first provided an appropriation of \$100,000 for investigation, surveys and studies of water resources and their use, with particular reference to the Colorado river basin. Part of the funds were designated for the closed basin project in the San Luis valley. House bill 126 provided funds to the state engineer for new surveys on the various mountain watersheds of the state. Since almost all of Colorado's water supply comes from snow, these surveys would aid in planning future water use.

News events of national and international importance included: Pres. Dwight D. Eisenhower's heart attack during his vacation in Denver. His hospitalization at the Fitzsimmons army hospital in Denver caused much concern to the world. New plans for the Air Force academy were released after the first plans met with much public opposition. Eighty per cent less glass would be used in the new academy which was under construction near Colorado Springs. Gov. Edwin C. Johnson (former U.S. senator) suffered a heart attack which prompted him to withdraw from future political positions.

The principal state officers for the term Jan. 11, 1955, through Jan. 8, 1957 were: Edwin C. Johnson (Dem.), governor; Stephen L. R. McNichols (Dem.), lieutenant governor; George J. Baker (Dem.), secretary of state; Earl E. Ewing (Rep.), treasurer; Homer F. Bedford (Dem.), auditor; Duke W. Dunbar (Rep.), attorney general.

In the Nov. 6, 1956, general election, Colorado voted heavily

in favour of Pres. Dwight D. Eisenhower, but went Democratic in some other important offices. John A. Carroll (Dem.), defeated former governor Dan Thornton in the race for the U.S. senate seat. The following were elected to the principal state offices for the term beginning in Jan. 1957: governor, Stephen L. R. McNichols (Dem.); lieutenant governor, Frank L. Hays (Rep.); secretary of state, George Baker (Dem.); auditor, Earl Ewing (Rep.); treasurer, Homer F. Bedford (Dem.); attorney general, Duke W. Dunbar (Rep.).

Education.—The state appropriation for education in public schools for 1956-57 was \$16,900,000. The school population, including persons from 6 to 21 years of age, was 378,218 as of April 10, 1956. Registered students numbered 324,917. There were 13,562 teachers employed during the 1955-56 school year. From the total appropriation used for state public school education, \$400,000 was scheduled for physically handicapped children; \$1,750,000 classroom unit aid; \$750,000 transportation aid. The 122 county and municipal libraries of Colorado loaned 5,448,780 books, films, records and other library materials to their patrons. The total book stock of Colorado's libraries was 1,845,613 with a total operating expense of \$1,412,738.78, for the fiscal year ending June 31, 1956. H. Grant Vest was state commissioner of education.

Social Insurance and Assistance, Public Welfare and Related Programs.—Disbursements for welfare purposes within Colorado for assistance and administration in the 1955-56 fiscal year amounted to \$74,508,302.12. Payments to, or on behalf of, recipients amounted to \$70,965,026.55, exceeding the 1954-55 expenditure by 7.58%. The old-age pension used 78.64%. The remaining 21.36% was distributed among the other programs in the following order: aid to dependent children, 10.50%; general assistance, 4.45%; aid to needy disabled, 4.71%; tuberculosis hospitalization .66%; aid to the blind .43%; child care .61%.

From Jan. 1 until Aug. 1, 1956, there was an average of 54,419 old-age pension cases per month receiving an average payment of \$86.12 per case; aid to dependent children 5,846 cases, average payment \$109.94; aid to the blind 327 award cases, average payment \$66.17; general assistance 1,878 cases, average payment for subsistence \$43.13; aid to needy disabled 5,062 cases, average payment \$57.93 per case.

There were four correctional institutions with a total of 2,233 inmates as of Sept. 1, 1956. These were divided as follows: boys' industrial school 223; girls' industrial school 108; boys' reformatory 365; and state penitentiary 1,537. The 1956-57 budgets for these institutions were as follows: boys' industrial school \$347,042; girls' industrial school \$221,000; boys' reformatory \$520,071; state penitentiary \$1,556,620. The total budget for all correctional institutions was \$2,644,733.

Communications.—Highways (county, state and federal) as of Jan. 1, 1956, totalled 74,790 mi.; 8,023 mi. were state highways, 62,566 mi. county highways and 4,201 mi. municipal. Total funds for all highway use for 1955 were \$36,013,485.63. There were 459 mi. of highways and 82 bridges constructed during 1955. There were 455 mi. of existing highways resurfaced. There were 14 railroads operating within the state with a total mileage of 4,002 and a valuation of \$136,021,400. Thirty-one telephone companies were in operation with 1,157,284 mi. of wire and a total valuation of \$47,308,580 and 2 telegraph companies, with 76,969 mi. of wire and a total valuation of \$676,500. As of July 31, 1956, there was a total of 548,394 telephones in use that were served by the Bell system. There were 48 standard AM radio stations, 3 FM stations and 11 television stations.

Banking and Finance.—Colorado's 165 federal and state banks reached a high of \$1,598,522,000 in deposits as of Jan. 1, 1956. This represented an increase of \$47,243,887 or 3% over the total deposits of \$1,551,278,113 on Jan. 1, 1955. Building construction in Colorado increased to \$307,826,293 during 1955 from \$265,587,857 in 1954, although the number of building permits remained substantially the same, about 80,000.

The cash balance in the state treasury as of June 30, 1956, was \$58,733,641.30. The total receipts in revenues for the fiscal year ending June 30, 1956, were \$277,995,339.78. The total cost for operating and nonoperating expenditures for the 1955-56 period was \$273,149,498.17. As of June 30, 1956, Colorado had a general fund balance of \$24,458,956.77 which included a \$10,000,000 revolving fund reserved by statute for working capital.

Agriculture.—The cash income from farm marketings through 1955 aggregated \$417,725,000 of which \$274,364,000 resulted from the sale of livestock and livestock products and \$143,361,000 from the sale of crops. Government payments including rental and benefit, soil conservation, agricultural adjustment program, price parity and Sugar act payments amounted to \$10,239,000. Cash farm income and government payments totalled \$427,964,000.

The number of cattle and calves on farms Jan. 1, 1956, was 2,075,000; stock sheep totalled 1,241,000; cattle in feed lots, 235,000; hogs and pigs totalled 195,000 head.

Table I.—Principal Crops of Colorado

Crop	Indicated 1956	1955	Average, 1945-54
Corn, bu.	14,937,000	16,650,000	13,328,000
Wheat, all, bu.	17,164,000	17,257,000	42,984,000
Oats, bu.	2,940,000	4,032,000	5,563,000
Barley, bu.	7,182,000	8,875,000	13,368,000
Rye, bu.	204,000	238,000	341,000
Hay crops, tons.	2,202,000	2,322,000	2,245,000
Dry beans, (100-lb. bags)	1,576,000	1,860,000	1,887,000
Potatoes, cwt.	9,853,000	9,120,000	10,552,000
Sugar beets, short tons.	2,000,000	1,621,000	1,920,000
Sorghum grain, bu.	2,112,000	4,950,000	2,816,000
Broomcorn, tons.	5,000,000	8,100,000	9,010,000
Apples, commercial, bu.	1,505,000	1,210,000	1,273,000
Peaches, bu.	1,830,000	2,110,000	1,762,000
Pears, bu.	240,000	150,000	194,000

Manufacturing and Industry.—The University of Colorado Bureau of Business Research estimate of value added to Colorado manufacturers in 1954 was \$471,507,000. There were an estimated 2,100 manufacturing plants operating full-time in Colorado in 1955. Wages and salaries for manufacturing were estimated at \$247,237,000 for 1954.

From Jan. 1, 1956, through Aug. 1, 1956, the monthly employment figures averaged 501,085 employed in nonfarming occupations and 89,755 in farming for a total employment of 590,240 for both farming and nonfarming occupations. The unemployment monthly average for this same period was 16,820 or 2.8% of the total labour force.

Tourist travel in Colorado is the fourth largest industry in the state. As of Sept. 26, 1956, the 1956 estimate from the state advertising and publicity department indicated an all-time high of more than 3,600,000 visitors spending a record \$250,000,000. (H. L. Hy.)

Mineral Production.—Including only those items whose value was \$100,000 or more, Table III shows the tonnage and value of Colorado minerals in 1953 and 1954. Colorado was first in molybdenum and uranium production in 1954, second in fluorspar, third in columbium-tantalum, fourth in lead mined and fifth in zinc mined. The most important of the U.S. uranium areas are in the Colorado plateau which consists largely of Colorado and parts of three adjoining states. It has substantial production of vanadium and in 1954 nearly doubled its 1953 output of columbium-tantalum, and ranked 15th in the value of its mineral output, with 1.84% of the U.S. total.

Commonwealth of Nations.

This is a community of independent nations and dependent or semidependent territories bound together by allegiance to the British crown or by recognition of the British sovereign as head of the commonwealth.

Throughout the year 1956 individual members of the commonwealth continued to pursue their various policies of alliance, with one another and with outsiders. India still ranged free, taking pains however to improve cultural and economic relations with other noncommitted areas such as Indonesia. Pakistan, having pondered the reference to Kashmir of the Soviet premier, N. A. Bulganin, as "a northern part of India," and thought over the comments of his colleague N. S. Khrushchev on the nefarious influence of U.S. monopolists, became on adoption of the constitution on Feb. 29 an Islamic republic, as had been predicted. Two days later the decision was taken to remain within the common-

wealth: this, said the then prime minister, Chaudhry Moham Ali, was a decision taken for reasons of "enlightened interest." At the meeting of the SEATO (Southeast Asia Treaty organization) council (March 6-8) held in Karachi, Pakistan brought up the perennial Kashmir question—quite improper in the opinion of India's prime minister, Jawaharlal Nehru, who delivered an attack in the house of the people on March 20 on the whole concept of military pacts in Asia directed by non-African nations. Pakistan riposted to this at a meeting of the Baghdad pact council (April 16-19) that this arrangement, which had its permanent organization, would prove a unifying factor among the peoples in the region who wished to preserve a free democratic way of life. Pakistan welcomed closer co-operation with the United States in schemes of economic assistance. The prime minister also pointedly described the commonwealth on June 25, as a "great mansion of peace," and took the opposite side to India at the London conference which discussed the problem of control of the Suez canal (Aug. 16-23).

In Ceylon, since Dec. 1955 a member of the United Nations, a general election in April unseated Sir John Kotelawala's United National party, which had been 25 years in office, and replaced it with the People's United Front led by S. W. R. D. Bandaranaike, who described his party as a "democratic socialist party, as opposed to the extreme conservative and capitalist character of our opponents." The new prime minister declared his intention to institute a republic, to make Sinhalese the national language (thus setting off considerable rioting) and then to take over U.K. bases at Trincomalee and Katunayake, under Ceylonese rights by legislation of 1947, and make—or not make—facilities available in them to the British.

The Union of South Africa still found scant time for assertion of any international position: indeed, on Nov. 9, 1955, its delegates had walked out of the UN general assembly following passage by that assembly of a 17-power resolution condemning

"ANOTHER KNOT IN THE LION'S TAIL," a 1956 cartoon by Pletcher of Sioux City Journal (la.)

apartheid as a policy, and they did not return until the autumn of 1956. At home, the Union government consummated its four-year struggle to obtain a remodelled senate. In the enlarged body, 77 out of the 89 members were Nationalists. The party was thus enabled to command 171 votes in a two-thirds majority of both houses in joint session, 5 more than was needed in order to amend the "entrenched clauses" of the Union act of 1909. As a result, the Separate Representation of Voters act was passed in joint session on Feb. 27, removing the coloured voters in Cape Province from the common roll.

In Australia Liberal-Country party coalition under the prime minister, Robert Menzies, increased its majority after the election of Dec. 1955 and faced the country's growing balance-of-payments problem. Australia budgeted to spend £A200,000,000 on its military obligations to the ANZUS and SEATO pacts, increased federal taxation and on June 28 cut imports by a further £A40,000,000, thus dealing a sharp blow at the export trade of the United Kingdom.

Canada's assertion of national and international status made great headway during the year. Still soaring on a tide of economic prosperity, it was able to provide an atomic reactor plant for India under the Colombo plan, and undertook to contribute \$26,000,000 in technical assistance under the plan for the seven years from April 1956—a figure comparing remarkably with the £7,000,000 set aside for this purpose by the United Kingdom.

At the seventh postwar conference of commonwealth prime ministers held in London (June 28–July 6) the communiqué placed unusual emphasis on the need to bring about disarmament, to raise living standards and to promote economic co-operation. The communiqué also reaffirmed commonwealth interest in the peace and stability of the middle east. In this theatre Menzies' words were soon given substance. The last U.K. forces in Egypt left Port Said on June 13. On July 26 Gamal Abdel Nasser, the Egyptian president, nationalized the Suez Canal company. The United Kingdom, after consultation with the French and U.S. governments, summoned a conference in London of canal users, and Menzies was deputed to lead a five-man committee, including a Pakistani delegate, to Cairo to lay before Nasser the views of 18 nations. India's alternative plan, that the canal should in fact be operated by Egypt assisted by an international advisory body representing the users, was supported by Ceylon. Canada did not attend the London conference, but commonwealth opinion rallied on the whole to the U.K. view that the canal was too vital a link to be left exclusively in Egyptian hands. None the less the U.K. action, taken conjointly with France, in attacking Egypt on Oct. 31, followed by an Anglo-French invasion of the canal zone on Nov. 5, caught both the commonwealth and the United States off balance. India condemned it; Pakistanis rioted in Karachi; Canada disowned it; Australia did not support the United Kingdom's use of the veto in the UN Security council, but Menzies shortly afterward spoke in favour of the Anglo-French action in Egypt; and S. G. Holland, prime minister of New Zealand, said he had full confidence in the United Kingdom's intentions in moving forces into the canal zone. Canada took a leading part in suggesting that an international police force should be sent to the Suez area to keep "the borders at peace."

Communism.

The year 1956 was one of the most eventful in the almost four decades of communist history since Nicolai Lenin overthrew the short-lived democratic regime in Russia in 1917. The 20th congress of the Communist party of the Soviet Union, which met in Feb. 1956 in Moscow,

concluded definitely, and even violently, the Stalin period in the history of communism. It officially proclaimed a return to Lenin. This in no way implied a liberalization of the regime for Lenin was completely dedicated to the idea of a communist world revolution and of the necessity of an implacable class war, and his successors remained faithful to this idea. Yet in 1956 they had to liquidate the Stalinist heritage of an unbelievable lawlessness, brutality and self-glorification, and this liquidation the memory of a man who had been praised to the sky and raised far above all other human beings by necessity brought confusion into the ranks of the communists, especially outside the Soviet Union.

The 20th Party Congress.—Three months before the party congress, at the celebration of the 38th anniversary of the communist revolution, L. M. Kaganovich, the government's spokesman for the occasion, told the audience of the fervent Bolshevik faith in the ultimate triumph of world revolution, but he also emphasized that the revolution would not be imposed from without. He upheld the new conciliatory foreign policy of the Soviet Union—the Austrian state treaty, the establishment of diplomatic relations with west Germany, the return of the Porkkala base to Finland, the reduction in Soviet armed forces and the new friendship with India and Burma—but declared that these actions did not stem from Soviet weakness but from the consciousness of growing strength and power.

The same confident tone characterized the address by N. S. Khrushchev, the secretary-general of the party, delivered before the party congress on Feb. 14. He emphasized the need of strengthening friendship with Asia, and he tried to promote dissension in the western alliance. He and A. I. Mikoyan, a first deputy premier, condemned strongly the "cult of personality" and deplored the distortion of recent history and the unjust accusations against early Bolshevik leaders committed under Stalin. Another important change was the new emphasis put upon Yugoslavia and its brand of independent communism, in contradiction to the attitude in Stalin's later years. The party congress unanimously endorsed the new policy, as unanimously and outwardly as enthusiastically as previous congresses had endorsed Stalin's policy. No step toward even the first growth of democracy was visible. Yet in a long secret report submitted by Khrushchev to a closed session of the congress and published later by the United States department of state, Stalin's crimes against his communist associates were openly acknowledged.

Khrushchev's Secret Report.—Though the report castigated Stalin's murdering of thousands of leading communists, it was silent about the greater crimes committed by Stalin against the peoples in the Soviet empire, including the Russian people. Nor did Khrushchev's condemnation of Stalin's despotism change in the slightest the one-party dictatorship with a self-perpetuating ruling group at its centre, responsible to nobody. Yet Khrushchev went so far as to accuse Stalin of practising "brutal violence" not only toward everything which opposed him, but also toward that which seemed, to his capricious and despotic character, contrary to his concepts. Whoever opposed this concept . . . was doomed to moral and physical annihilation." Khrushchev cited many examples of cruel arbitrariness. The question which Khrushchev did not answer, and which his audience did not ask, was about the validity of a system which made such unbelievable governmental excesses possible and veiled them for many years in a cloud of the most exaggerated praises of governmental policy and leadership ever known in history.

As a result of Khrushchev's speech a large number of leading communists who had been executed or who had disappeared were restored to honourable positions in the history of communism now being again rewritten to fit the demands of the present leadership. Others were released from prison. The government

even approved campaigns in the Soviet press against the great Russian chauvinism manifested in the treatment of the non-Russian nationalities, and against "the vicious and harmful practice" of Soviet historians in exaggerating Russian successes and concealing Russian weaknesses. The Soviet government even went so far as to publish Lenin's criticism of Stalin, which Stalin had previously suppressed and which had not been made public before, though it was known outside the Soviet Union. These revelations created a great unrest in the Communist party, not so much in the U.S.S.R., where all expressions of public opinion continued to be strictly controlled, but among communists abroad. On July 2 the central committee of the Soviet Communist party was obliged to publish a lengthy announcement justifying the anti-Stalin campaign on the one hand and the Soviet system on the other hand.

Communism in Ferment.—Outside the Soviet Union the 20th congress of the Soviet Communist party produced great fermentation among communists. This fermentation was strongest in Poland and in Italy, yet it made itself felt also in other satellite countries with the exception perhaps of Rumania and Bulgaria. In the Soviet Union itself, *Pravda*, the official communist organ, stressed on April 5 the limits of any criticism allowed and emphasized that the party line and the party leadership were beyond discussion. Another editorial on July 6 acclaimed the one-party system and the strictly centralized rule even of thought in communist society. Iron discipline and absolute subordination were demanded of the Soviet workers. But it was more difficult to enforce this position abroad. Even in the Soviet Union there was unrest in Georgia, where apparently many Georgians remained faithful to the glorification of Stalin, their fellow-Georgian. In the satellite countries many of the communist leaders exalted on Stalin's orders were rehabilitated. Among them were Laszlo Rajk in Hungary and Traicho Kostov in Bulgaria. It had now become official Moscow policy to be friendly with Yugoslavia, and therefore "Titoism" had ceased to be a crime. The rehabilitation of Rajk and Kostov went a long way to make a re-union of Hungarian-Yugoslav and Bulgarian-Yugoslav relations possible.

The change in Poland went far more deeply. With a liberty unknown in other communist lands, Polish intellectuals and writers demanded greater freedom of thought and expression. The intellectual unrest was increased by the grave economic crisis under which the country suffered, and led to a violent demonstration of Polish workers in the industrial city of Poznan on June 28. The official communist organs admitted that excessive demands had been made on the workers since the war and called for a more democratic economic program in which a greater share of profits would go to the workers. But the demonstrators not only demanded economic betterment; they also shouted for a freer press. Developments in Poland went so far that the demonstrators at Poznan were tried in September and October in fair and open trials, the like of which had never been seen in communist lands; and the Polish Communist party announced in a statement at the end of July that it was stepping out from the direct management of the nation's affairs and would provide only "political inspiration" for the government.

Communism in Crisis.—The turn in Polish affairs came on Oct. 19, when Wladyslaw Gomulka, who was imprisoned in 1951 at Stalin's order as the Polish "Tito" and was released only in 1956, was elected to the central committee of the Polish Communist party; on Oct. 21 he became a member of the Polish Politburo. Under his leadership Polish nationalist communists prevailed. The military alliance between the U.S.S.R. and Poland was maintained, but Marshal Konstantin Rokossovsky was replaced as Polish minister of defense by Gen. Marian Spychalski, a close friend of Gomulka and like him long imprisoned as a

Titoist. A statement signed by Soviet and Polish communist leaders on Nov. 18 confirmed important political, economic and military gains for Poland and put the two nations on a new footing. The new Polish government also established better relations with the Polish Catholics, and Stefan Cardinal Wyszynski was set free. (See also POLAND.)

A similar attempt to put Hungarian-Russian relations on a new footing failed. Imre Nagy, who had been expelled from the Communist party as a "rightist," was readmitted on Oct. 15, and on Oct. 24 he replaced Andras Hegedus as premier. The next day he dismissed Erno Gero as first secretary of the party and re-

placed him with Janos Kadar, who had spent three years in a concentration camp as a "Titoist." Yet the Hungarian people, students and workers demanded much more—a real democratization of the regime, the abandonment of the military alliance with the U.S.S.R., and Hungarian neutrality. Nagy was willing to comply and appealed to the United Nations, but on Nov. 4 the Soviet army took the counteroffensive and installed a new government under Kadar, accusing Nagy of having "betrayed" the revolution by giving in to "reactionaries." Kadar, in spite of his promise to establish full equality with the U.S.S.R. and to follow a "Hungarian" road to "socialism," failed to win public confidence. Hungarian resistance was put down by the Soviet army, and a general strike of the Hungarian workers paralyzed Hungary's life.

In Yugoslavia Marshal Tito followed the Polish and Hungarian attempts to change the relationship between the U.S.S.R. and its satellites with greatest sympathy for the satellites, yet he objected to Hungarian attempts to replace communism by a democratic system. The relationship between Moscow and Belgrade deteriorated during November, especially after Imre Nagy, who had taken refuge in the Yugoslav embassy in Budapest, was abducted by Soviet forces and exiled to Rumania. The Russian action in Hungary aroused widespread protests not only in the United Nations but also among procommunists in the western countries. Among the satellites, Titoist influence seemed to be gaining as against that of Moscow.

Communism in Italy.—The most powerful Communist party outside the Soviet orbit was the Italian party. On June 16 Palmiro Togliatti, first secretary of the Communist party, criticized not only Stalin but the present Soviet leaders for helping build up the Stalin myth. He called upon them to explain how Soviet society could and did arrive at certain forms which were not only far removed from legality but were open signs of degeneration. A few days later, the leader of the Italian Socialist party, Pietro

"WHAT'S OUR POLICY TODAY, COMRADE?!" a cartoon of 1956 by Fletcher of the *Sioux City Journal* (la.)

Nenni, who so far had followed the communist line and was a faithful ally of the communists in Italy, continued Togliatti's attack against Moscow and went far beyond it. Nenni demanded the introduction of democracy into the Soviet Union, with freedom of political speech and ideas. By the end of the year Nenni severed his close alliance with the communists and conducted negotiations for co-operation with the democratic wing of the Socialists under the leadership of Giuseppe Saragat, a determined opponent of all forms of dictatorship. In October an Italian communist delegation under Luigi Longo, the second in command among the Italian communists, visited Yugoslavia. In a lengthy interview Longo hailed the example of Yugoslavia without once mentioning that of the Soviet Union. This action bore testimony not only to changes in the Italian Communist party line but also to the enhanced position and prestige of Yugoslavia in the communist world.

Yugoslavian Communism.—During 1956 the Soviet leadership continued its policy of "appeasing" Marshal Tito. As a gesture in that direction, the Cominform, a Soviet-led coalition of the Communist parties of the satellite countries and of those of Italy and France, was dissolved in April. The Cominform (Communist Information bureau), established in Wilcza Gora, Pol., in 1947 as a successor to the Communist International which was dissolved in 1943, became in 1948 the chief Stalinist instrument of anti-Tito agitation. Now it was dissolved, probably at Tito's behest, at the very time when in most satellite countries the old anti-Tito leadership was removed from control. Tito's influence seemed to strengthen in the satellite countries the trend toward greater independence from Moscow, a trend which was in no way welcome to the Kremlin leaders. He visited the U.S.S.R. in June and pleaded for a new relationship between Moscow and the Communist parties outside the Soviet Union. The question, however, seemed not to be entirely clarified; for this reason Khrushchev visited Yugoslavia in September to confer with Tito, and

Tito went later to a Black sea resort to continue his conference with Soviet leaders. The chief point at issue was the new post-Stalinist and even anti-Stalinist theory that there were different roads to the realization of communism and that the road travelled by Moscow was in no way binding upon the communists in other countries.

Communism in Other Lands.—Though the Communist party in the United States is without any importance in numbers and influence, it was nevertheless significant for the trend of the time that the party issued in September a long statement confessing past errors and proposing far-reaching reforms. It asserted that it discarded as obsolete the theses held by Lenin and Stalin that war was inevitable under capitalism and that a violent proletarian revolution was indispensable for the realization of socialism. The statement pointed out that the party had been entirely unprepared for, and deeply shocked by, Khrushchev's revelations regarding Stalin. The statement was to be submitted to a national convention called for Feb. 1957, the first such convention since 1950. The present membership of the party was given as "somewhat between 20,000 and 25,000."

In other countries, outside the United States, communist influence was not negligible. In fact, as a result of a more flexible and outwardly conciliatory foreign policy of the U.S.S.R., this influence was growing, especially in Asia.

The Suez canal crisis gave the Soviet Union an opportunity of playing the role of friend and champion of Egypt and of the whole Arab world. The state visit paid by Nikolai A. Bulganin and Nikita S. Khrushchev to India and Burma in the late fall of 1955 established extremely cordial relations with these countries. The new friendship of Moscow's leaders for Jawaharlal Nehru made the position of the Communist party in India more difficult. It continued to attack Nehru and to be attacked by him on domestic issues. In Indonesia Pres. Achmed Sukarno favoured close co-operation with the communists, but he was forced to accept a cabinet which excluded communists. In Burma the communists more than tripled their representation in parliament in the election held at the end of April. In Ceylon the communists did not make any gains but the elections resulted in the victory of a neutralist party instead of a pro-western governmental party. Similarly, in Iceland, as result of elections held in July, a new leftist government was formed in which the communists received one-third of the cabinet seats. The formation of the new government meant an increase in trade with communist countries and growing determination to oust United States NATO forces from the island.

In Sept. 1956 the Chinese Communist party held its first party congress in 11 years. Following the general line of the moment, Mao Tse-tung spoke about an easing of the world situation but gave full support to all "anti-imperialist" and "anti-capitalist" movements and trends throughout the world.

Relaxation in World Tension?—A number of small steps were taken which signified some relaxation of world tensions. The United States and the Soviet Union arrived at an agreement according to which official publications of the two governments would be made accessible to the citizens of the other country. A magazine, *Amerika*, in Russian, was produced by the United States government for distribution in the U.S.S.R., and a similar Soviet-produced magazine in English was made available in the United States. The first edition of the Russian Bible since the Bolshevik revolution was published at the beginning of 1957 by the Moscow patriarchate of the Russian Orthodox Church. Trade between the communist bloc and the rest of the world rose by 24% in 1955. A communist economic offensive was especially noticeable in underdeveloped countries. The number of Soviet bloc exhibits in trade fairs jumped from 125 in 1954 to 288 in 1955.

However, the suppression of the Hungarian movement for liberty by the Soviet army aroused sharp indignation abroad and in the United Nations. And already in March 1956 the democratic Socialist International had rejected all communist overtures for co-operation. "We believe in democracy; the Communists don't," the statement read. "We believe in the rights of men; they mock them. This is not changed by the refutation of Stalinism. Repudiation by those who whether in fear for their lives or in genuine complicity previously helped in Stalin's crimes and praised his sins has not fundamentally altered the character of the Communist regime. Even with collective leadership it yet remains a dictatorship."

Community Chest–United Fund. Community Chest has been for many years the name given to a local fund-raising federation representing voluntary health, welfare and recreation agencies, major contributing groups and individual citizens in nearly 2,000 communities in the United States. Since 1950 nearly half these chests have enlarged their scope to become "united funds" which include in their annual campaigns funds not only for local services but also for national causes such as the American Red Cross, heart, cancer, mental health and crippled children funds. During these years united campaigns also extended their geographical boundaries beyond city limits to include outlying communities in one united appeal for metropolitan or county areas.

Associated with or a part of the chest or united fund in most cities is the community welfare council, the purpose of which is to co-ordinate the services of its member agencies and to provide machinery for community-wide study and planning of health, welfare and recreation services, both voluntary and tax-supported.

Federated planning and fund raising are designed to (1) achieve co-ordination of health and welfare services, national and local; (2) substitute teamwork for competition in fund raising, with resulting economies in campaign costs; (3) distribute funds fairly, according to community needs and proportionate responsibility; (4) account to the public for every dollar raised; and (5) stimulate active participation by local citizens in health and welfare matters.

The national association of local chests, united funds and councils is United Community Funds and Councils of America, Inc. (formerly Community Chests and Councils of America), which was established in 1918.

National promotion on behalf of local campaigns is carried on under the name of United Community Campaigns of America.

Of the 2,524 community chests, united funds and welfare councils in operation in July 1956 (2,063 chests and funds and 461 councils), 1,994 chests and funds and 434 councils were in the U.S., 69 chests and 27 councils in Canada. The chest and council idea has also been adopted in the British West Indies, Japan, the Philippines, the Panama Canal Zone, Cuba, Greece, Australia

and Mexico.

In 1955 more than 26,300,000 contributions totalling \$339,206,067 were made through chests and united funds. United funds accounted for \$200,000,000 of this sum.

Officers of United Community Funds and Councils of America, Inc., for 1956 were: honorary president, Gerard Swope (New York city); president, James A. Linen (Greenwich, Conn.); treasurer, G. Warfield Hobbs (New York city); secretary, Vincent B. Coffin (Hartford, Conn.); vice-presidents, John A. Greene (Cleveland, O.), Joseph A. Beirne (Washington, D.C.), Ray R. Eppert (Detroit, Mich.), Peter Howard (Oakland, Calif.), Ralph H. Blanchard was executive director. Headquarters are at 345 East 46th street, New York 17, N.Y. (B. A.)

Community Planning: see BUILDING AND CONSTRUCTION INDUSTRY; MUNICIPAL GOVERNMENT; TOWN AND REGIONAL PLANNING; URBAN TRANSPORTATION, U.S.

Community Trusts. Aggregate holdings of \$158,573.803 were reported by community trusts in the United States and Canada at the beginning of 1956. During 1955, these composite charitable foundations appropriated \$6,707,422 and received incoming resources totalling \$11,220,281.

The largest of these organizations was the New York (N.Y.) Community trust, whose 111 funds were valued at \$26,837,388. The Cleveland (O.) foundation reported resources of \$19,027,780; Permanent Charity fund, Boston, Mass., \$14,052,427; Chicago (Ill.) Community trust, \$13,835,831; and California Community foundation, Los Angeles, \$10,752,986. The New York Community trust disbursed \$1,146,688 in 1955; Cleveland foundation, \$764,831; Chicago Community trust, \$749,321 and Permanent Charity fund (Boston), \$621,386.

Funds newly received in 1955 included \$3,837,621 reaching the Hartford (Conn.) foundation; \$1,625,041 added to the Chicago Community trust; \$776,600 given to the Minneapolis (Minn.) foundation; \$729,689 to the Vancouver (British Columbia) foundation; and \$724,206 accruing to the New York Community trust. Of 75 community trusts surveyed in 1955, 73 were administering principal resources and 66 were making current distributions out of 1,301 funds on hand. Their cumulative disbursements in the 20 years from 1936 through 1955 stood at \$62,028,508.

A community trust consists, usually, of a series of trust funds of varied sizes, held by corporate trustees and applied for charitable uses under the central supervision of a joint distributing committee. The trustee of a given fund is ordinarily chosen by its founder. The custody and investment of any particular fund are the responsibilities of its trustee. The distributing committee authorizes all disbursements by the trustee and, in so doing, customarily undertakes to give expression to any specific charitable desires of a founder but is also empowered to take appropriate remedial action if originally expressed preferences later become impossible or impractical of execution.

Congregational Christian Churches. Membership of the Congregational Christian Churches in the United States increased by 31,473 in 1955 and Sunday school enrolment by 29,703. The gross increase in church membership was 111,895, the largest annual increase the denomination had ever enjoyed. Of the new members admitted during 1955, 55,330 never before had made public con-

fession of the Christian faith. This was the largest number of admissions "by confession" for any year during the more than three centuries of Congregational history in the country.

The first Congregational church in America was founded by the Pilgrims in 1620. By 1956 the denomination had 1,342,045 members in 5,561 Congregational Christian Churches. The Sunday school enrolment was 773,235.

During 1955, 56,565 persons entered Congregational Christian Churches from other Christian churches and 30,876 left the former for the latter. At the beginning of 1956 there were 136,973 persons who had moved from the neighbourhood of the churches where they were members without becoming affiliated with any church in the neighbourhood to which they had gone.

Giving to benevolences in 1955 increased \$1,998,939 over 1954 to \$11,524,376; and the expenditures by local churches on their own programs went up \$3,388,504, totalling \$46,413,042. The denomination spent \$25,189,946 on new church buildings, an increase of \$4,846,902. The value of church property rose \$36,879,656 to \$474,767,940.

There were 63 new Congregational Christian church buildings completed and dedicated in the United States during 1955. The number of churches with memberships of 250 to 499 rose from 930 to 948; 469 churches had memberships of from 500 to 999 and 201 churches were recorded with memberships of more than 1,000—5 more than the previous year. Thirty-eight churches, with memberships of less than 50, were closed during the year. The year 1955 was the first in more than a generation in which the total number of churches exceeded that of the previous year.

At the beginning of 1956 there were only 321 congregations without regular ministers. The pulpits were therefore better supplied than in any previous year in the entire history of the denomination.

On June 23, 1956, in Omaha, Neb., the general council of the Congregational Christian Churches voted to unite with the Evangelical and Reformed Church in 1957, to form the United Church of Christ. The membership of the two denominations as of Jan. 1, 1956, was more than 2,100,000. This union, if consummated, would be according to a Basis of Union with Interpretations as drawn up by the two denominations and approved by them in 1947-49. These documents outlined a procedure for consummating the union and beginning the work of the new United Church of Christ. (See also CHURCH MEMBERSHIP.)

Connecticut. This next-to-the-smallest of the New England states, and also one of the original 13 states, is bounded on the north by Massachusetts, on the east by Rhode Island, on the south by Long Island sound and on the west by New York. It is variously known as the "Nutmeg state," the "Land of Steady Habits" or the "Constitution state." Its area is 5,009 sq.mi., of which 110 sq.mi. are water. The estimated population (July 1, 1956) was 2,232,000, as compared with 2,007,280 according to the 1950 census. Largest cities and population (1950) were: Hartford (the capital), 177,397; New Haven, 164,443; Bridgeport, 158,709; Waterbury, 104,477; Stamford, 74,293; and New Britain, 73,726.

History.—There was no regular session during 1956 of the general assembly, which sits only in odd-numbered years, and the governor did not call a special session. The outstanding feature of the year was the quick return to full employment and production by those plants devastated by the August and October floods of 1955. A survey made by the state labour department showed that, of 326 damaged plants in the seven stricken areas,

only seven had failed to reopen by July 1956.

The results of the series of flood relief tax measures enacted at the Nov. 1955 special session of the general assembly had not been fully reported by the tax commissioner, but for the first six months they produced approximately \$10,450,000. Most of these temporary taxes ran for 9 months from Jan. 1. The sales tax had been increased from 3% to 3½%, the cigarette tax was raised one cent per pack, surtaxes of 12½% on existing rates were levied for amusements, and taxes on industrial and commercial corporations and other business corporations continued. It seemed quite likely that for the full 9 months these taxes would produce the \$15,500,000 which the legislature estimated was needed. The additional two cents per gallon motor fuel tax was not included in this figure but was kept in a special fund for repairs to highways, which were severely damaged.

The construction of four large new bridges was under way in the state, two in the Hartford area and two in New Haven. The Greater Hartford Bridge authority let a contract for a bridge across the Connecticut river between Windsor and South Windsor, and also a second one across the same river to be known as the Founders bridge, connecting Hartford, at the foot of State street, with East Hartford. In New Haven, the state highway department had under construction, as part of the Connecticut turnpike, a bridge over the Quinnipiac river which was said to be the largest girder bridge in the U.S. and probably in the world. The highway department was also building a second girder bridge, only slightly smaller than the other, over the New York, New Haven and Hartford Railroad tracks, as part of a connecting spur of the Connecticut turnpike into downtown New Haven.

On Friday evening, July 27, about 300 convicts at the Wethersfield State prison staged a sit-down strike over a number of grievances. The warden resigned, and the governor put Adjutant General Frederick G. Reincke in charge until a new warden could be appointed. There was no bloodshed, but a firm stand by the governor averted what could have developed into a serious situation.

Elections.—In the few town and city elections prior to the November election, some changes took place; but on balance neither political party could claim a victory, nor was there any indication of the astonishing Republican landslide which was to come. In the November election, Pres. Dwight D. Eisenhower received 711,837 votes to Gov. Adlai Stevenson's 405,079, a plurality of 306,758, the largest given any presidential candidate in Connecticut history. It more than doubled the plurality of 129,363 given him in 1952. In the important senatorial race Sen. Prescott Bush (Rep.), received 608,255 votes as compared with the 477,769 received by his Democratic opponent, Rep. Thomas J. Dodd. The plurality of 130,486 greatly exceeded that of 1952. All five Republican congressmen were re-elected and Dodd's Democratic seat was won by Republican Edwin H. May. Far-reaching changes were made in the composition of the new state legislature. The Republicans won 31 of the 36 senatorial districts, as against the existing Democratic control of 20 seats to 16 Republican. In the lower house of 279 members there would be 245 Republicans and 34 Democrats as against the existing 187 Republicans and 92 Democrats. As a result of the election, therefore, there would be a total of only 39 Democrats in both houses and 276 Republicans. Of the large cities only Hartford remained in the Democratic column, and this at a greatly reduced majority.

Education.—For the school year 1955-56 there were 22 colleges and professional schools with 32,536 students; 4 teachers' colleges with 5,422 students; 4 junior colleges with 1,347 students; 23 state vocational technical and state-aided schools with 473 teachers and 16,669 students. There were 99 high schools with 3,452 teachers and 76,924 pupils; 41 junior high schools with 1,172 teachers and 32,046 pupils; 740 public elementary schools with 9,612 teachers and 291,252 pupils. In addition

here were 208 parochial, ecclesiastical and private schools with 2,806 teachers and 73,899 pupils.

Social Insurance and Assistance, Public Welfare and Related Programs.—During the month of June 1956, \$1,484,477 was paid to 16,403 persons for old-age assistance; \$734,219 to 5,365 dependent children; 337 blind persons received \$33,382; and \$252,473 was paid to 2,133 disabled persons. The state maintains one veterans hospital with 1,120 patients, three hospitals for the mentally ill with 10,309 patients in 1956, two institutions for mental defectives with 3,372 patients, 4 tuberculosis sanatoria with 851 patients. There are also two U.S. veterans hospitals in the state.

Communications.—For the year ending June 30, 1956, there were registered 1,025,697 motor vehicles of all classes. Motor vehicle fees amounted to \$13,416,930, and the gasoline tax receipts were \$39,025,251. Telephone outlets numbered 1,024,484. There were 25 standard broadcasting stations, FM stations and 5 television stations. There were 26 daily newspapers published in the state, 6 Sunday papers and 65 weeklies. There were 3,062 mi. in the state highway system, of which 185 were of divided lane.

Banking and Finance.—The state treasurer reported that the state's financial condition as of June 30, 1956, was as follows: cash balance, June 30, 1955, \$26,811,719.14; receipts, \$1,278,319,756.63; disbursements, \$1,280,521,044.88; cash balance, June 30, 1956, \$24,949,370.89. Bonded indebtedness was \$121,447,000. Contingent liability for payment of Greenwich-Hillings expressway revenue bonds, \$200,000,000. The bank commissioner reported that as of June 30, 1956, 51 state banks and trust companies had assets of \$1,184,710,566; 45 trust departments of state banks and trust companies had assets of \$991,227,894; 71 savings banks had assets of \$2,149,203,534; and 30 building or savings and loan associations had assets of \$142,321,845.

Agriculture.—The U.S. department of agriculture reported that for 1955 the total cash receipts from farm marketing were \$171,477,000. Receipts from eggs, broilers and chickens were \$57,901,000; from dairy products, \$44,376,000; from cattle and calves, \$4,964,000. Receipts from principal field crops were: tobacco, \$24,633,000; potatoes, \$3,771,000; apples, \$3,330,000; greenhouse and nursery products, \$17,536,000.

Table I.—Principal Crops of Connecticut

Crop	Indicated 1956	1955	Average, 1945-54
Corn, bu.	2,064,000	1,638,000	1,912,000
Wheat, bu.	66,000	64,000	100,000
Oats, all, tons	381,000	394,000	432,000
Soybeans, lb.	23,392,000	31,270,000	36,772,000
Apples, bu.	1,070,000	1,530,000	1,191,000
Peaches, bu.	145,000	155,000	140,000
Pears, bu.	50,000	60,000	47,000
Potatoes, cwt.	1,435,000	1,122,000	1,386,000

Source: U.S. Department of Agriculture.

Manufacturing.—The state labour department reported that in July the total nonagricultural employment totalled 895,690, slightly less than in June, but more than 32,000 over the previous year. Those engaged in manufacturing numbered 426,660 and those in nonmanufacturing, 469,030. In the manufacturing category, the largest group (305,800) were engaged in the metals industry and its products. In the nonmanufacturing category, the largest group (151,050) were engaged in trade. The average weekly wage of factory production workers was \$81.18, and of construction workers, \$97.05. (J. Br.)

Table II.—Principal Industries of Connecticut

Industry	All employees 1954	Salaries and wages 1954	Value added by manu- facture 1954	Value added by manu- facture 1953
			(in thousands)	
Textile mill products	26,538	92,776	138,059	186,063

Mineral Production.—The tonnage and value of those minerals produced in Connecticut in 1953 and 1954 valued at \$100,000 or more are shown in Table III. Among the states Connecticut was second in domestic mica sold and fourth in feldspar output in 1954. Connecticut ranked 45th in value of its mineral output, with 0.07% of the U.S. total.

Table III.—Mineral Production of Connecticut

Mineral	1953		1954*	
	Quantity (in short tons)	Value	Quantity	Value
Total	438,000	\$7,917,000	289,000	\$9,686,000
Quartz	11,000	448,000	10,000	285,000
Feldspar	3,026,000	63,000	4,846,000	60,000
Sand and gravel	2,827,000	2,348,000	2,829,000	4,315,000
Other minerals	—	4,235,000	—	4,269,000

Consumer Credit. During 1956 consumer credit in the United States continued to rise, although in an amount substantially less than the increase in 1955. Instalment credit extensions dropped somewhat, but repayments continued their steady movement upward.

Amount Outstanding.—Total consumer credit in the U.S. reached a new record peak of \$40,196,000,000 on Oct. 31, 1956, more than \$3,600,000,000 over the total amount outstanding a year before. The increase in the calendar year 1955 had been \$6,350,000,000.

Total instalment credit, which is by far the largest component of consumer credit, reached a new peak of \$30,810,000,000 by Oct. 31, 1956, up \$2,840,000,000 during the preceding 12-month period. This compared with an increase of \$5,450,000,000 in the calendar year 1955. Total noninstalment credit, including single-payment loans, charge accounts and service credit, aggregated \$9,385,000,000 at the end of Oct. 1956, an increase of \$780,000,000 during the previous year, again less than the \$900,000,000 increase in the calendar year 1955.

At the end of Oct. 1956, of the total amount of instalment credit outstanding, \$14,480,000,000 or 47% was automobile paper, \$7,600,000,000 was other consumer goods paper, \$1,780,000,000 was repair and modernization loans and \$6,950,000,000 was personal loans. Sales finance companies held the largest portion of automobile paper, \$7,330,000,000, followed by commercial banks, with holdings of \$5,760,000,000.

Extensions and Repayments.—Instalment credit extensions, at seasonally adjusted annual rates, declined from a record \$40,400,000,000 in the third quarter of 1955 to \$39,300,000,000 in the third quarter of 1956, as a result of a sharp drop in consumer instalment credit extended for purchase of automobiles. Meanwhile, instalment credit repayments continued to climb from an annual rate, seasonally adjusted, of \$34,400,000,000 in the third quarter of 1955, to \$37,600,000,000 in the third quarter of 1956. Thus the annual rate of change in outstanding instalment credit, or the excess of extensions over repayments, dropped from \$6,000,000,000 in the third quarter of 1955 to only \$1,700,000,000 in the corresponding period in 1956. In large part this decline was caused by the sharp drop in the annual rate of change in outstanding instalment credit on automobile paper from \$4,260,000,000 to \$350,000,000.

The annual rate of instalment credit repayments in the third quarter of 1956 had reached a new high, both in absolute amount and in relation to income. The ratio of such repayments to total disposable personal income stood at 13.0%, as compared with 12.1% in the fourth quarter of 1954, before the tremendous 1955 automobile year, financed by record expansion of instalment credit.

Stand-by Authority.—In his economic report of Jan. 1956, the president made the suggestion that a study of the need for stand-by authority to regulate instalment credit terms would be timely. Somewhat later, the board of governors of the federal reserve system outlined a major study of consumer credit which it was undertaking at the request of the Council of Economic Advisers. The inquiry was to analyze the part played by instalment credit in the fluctuations in major consumer industries and the general economy and appraise the desirability and effects of control over instalment credit terms. Considerable discussion ensued, with almost all consumer credit executives being definitely against granting the federal reserve system stand-by authority to control consumer credit in peacetime. A substantial

body of opinion in the central banking field, however, held to the view that the successive easing of terms during 1955 had raised questions as to the soundness of credit based on such terms. Losses and delinquencies remained relatively low, nevertheless, with good business conditions and record levels of personal income.

Instalment Debtors.—The 1956 survey of consumer finances conducted by the board of governors of the federal reserve system in co-operation with the survey research centre of the University of Michigan, Ann Arbor, did not show any marked changes in the distribution of indebtedness among spending units, largely families, from early 1955 to early 1956. About 63% of all spending units reported some debt other than charge accounts early in 1956, with 9% owing mortgage alone, 17% owing mortgage and personal debt and 37% owing personal debt alone.

Debt was reported by more than 80% of all married couples under 45 with children. About one-third of all indebted spending units had more liquid assets than debt. Two-thirds of the spending units with instalment debt in early 1956 had scheduled repayments equal to less than 20% of their disposable income. Most of the remaining third were committed to make repayments amounting to between 20% and 40% of their income after taxes.

(See also FEDERAL RESERVE SYSTEM.)

(J. K. L.)

Canada.—Official consumer credit data are presented in a revised series which excludes the charge accounts and instalment credit of dealers who extend credit mainly to farmers or other businesses rather than to consumers. The figure of \$2,098,000,000 previously given for total consumer credit outstanding as of June 30, 1955, was thereby reduced to \$1,933,000,000. Revised midyear figures of previous years were: 1954, \$1,725,000,000; 1953, \$1,564,000,000; 1952, \$1,076,000,000.

By midyear 1956, total consumer credit had risen to \$2,302,000,000 which was a gain of 18½% from the previous year and more than double the figure of 1952.

Personal cash loans extended by banks and small loan companies of \$892,000,000 were 20% greater than at midyear 1955. Instalment credit rose 23% to \$1,072,000,000; the components of this figure were the outstandings of finance and loan companies which amounted to \$704,000,000 (up 26%) and the instalment credit on the books of retailers, \$368,000,000 (up 17%). The receivables of retail dealers on consumers charge accounts amounted to \$338,000,000, a gain of 7%.

The year 1956 was characterized by a demand for credit that exceeded the supply of funds. Although the capital investment programs for 1956, exceeding by 28% the record capital outlays of 1955, were the major cause of the rising credit demand, the governor of the Bank of Canada stressed that "consumer credit has been climbing at a rate that makes it a major cause of concern." Monetary policy was aimed at making money tighter and discouraging further undue credit expansion. Following upon the rise of the Central Bank's rediscount rate from 1½% to 2¼% between Aug. and Oct. 1955, this rate was subsequently raised in successive steps to the record rate of 3½% in Oct. 1956. As an innovation, the Bank of Canada finally introduced a flexible discount rate policy whereby the rate would always be ¼ of 1% above the average rate at which the weekly issue of treasury bills is discounted. As a result, the discount rate was 3.59% in early Nov. 1956.

(R. Rr.)

Contract Bridge.

France won the world team championship, defeating the U.S. team in a match played in Paris in Jan. 1956. The winning team was composed of Pierre Jais, Roger Trézel, Bertrand Romanet, Robert Lattès, Pierre Ghestem and René Bacherich. The U.S. team included Myron Field, Lee Hazen, Richard F. Kahn and Samuel M. Stayman of New York city, Charles J. Solomon of Philadelphia, Pa.,

and Charles H. Goren of Miami Beach, Fla.

In the annual European championships, played at Stockholm Swed., in July, Italy won the right to represent Europe in the next world championship match. The standing in "victory point" (2 for a match won, 1 for a match drawn) was: Italy, 25; France, 25 (but fewer total points than Italy); Austria, 23; Great Britain, 22; Switzerland, 17; Iceland, 16; Sweden, 15; the Netherlands, 15; Belgium, 14; Denmark, 13; Germany, 13; Egypt, 1; Norway, 10; Finland, 9; Lebanon, 8; Ireland, 1. France won the women's team championship, with Belgium second, Sweden third and Norway fourth.

Members of the winning Italian team were W. Avarelli and Belladonna of Rome and E. Chiaradia, M. D'Alelio, P. Forgi and G. Siniscalco of Naples. The match between them and the U.S. team was scheduled to be played in New York in Jan. 1957. The U.S. representatives, winners of the American Contract Bridge league's masters' team championship, were Harold Ogburn, Boris Koitychou, Peter Leventritt and Mrs. Helen Sobel of New York city and Goren and William Seamon of Miami Beach, Fla.

Winners of the principal U.S. championships, other than the masters' team championship, were:

Life masters' individual: John R. Crawford, Philadelphia.

Masters' pairs: Alvin Roth, Washington, D.C., and Tobin Stone, New York city.

Open team-of-four championship (Harold S. Vanderbilt cup): Howard Schenken, B. Jay Becker and George Rapée, New York city; John R. Crawford and Sidney Silodor, Philadelphia.

Match point team-of-four championship: Becker, Rapée, Crawford and Silodor.

Open pairs: Paul Hodge, Abilene, Tex., and Ben Fain, Houston, Tex.

As in 1955, an estimated 200 new books on bridge were published. The number of U.S. daily newspapers publishing bridge features rose more than 20%, from about 900 to nearly 1,100.

During the year there were renewed but unsuccessful efforts to have Negroes admitted to membership in the American Contract Bridge league, which had 60,000 members, all also members of semiautonomous state and local associations. Traditionally barred from this league, Negro bridge players generally belonged to the American Bridge association, which had about 2,500 members, nearly all Negroes.

(A. H. Md.)

Co-operatives.

In 1956, an estimated 81,000,000 families throughout the world voluntarily worked together through co-operatives to provide themselves with necessities, goods and services. They owned these self-help businesses democratically in most cases, through the one-member, one-vote principle of share ownership and control. In some cases, as in Great Britain and Israel, these businesses were the largest enterprises in the nation. They ranged from fishermen's co-operatives in the south seas, Japan and Nova Scotia, to large rural electric co-operatives with many thousands of members in the U.S., with more than 1,000,000 members in the London Co-operative society.

In 1956 the International Co-operative alliance, the bulk of whose member societies are in western Europe and Scandinavia, decided to extend a helping hand to the newer co-operatives in underdeveloped countries and voted to hold an Asian co-operative conference in 1957. The alliance also became more active in its program of technical aid to Asian co-operatives launched after World War II by Asiatic governments and by United Nations technical agencies.

CARE (the Cooperative for American Remittances to Everywhere) and the Co-operative League of the U.S.A. started a broad program late in 1956 to raise funds for specific gifts of loans to co-operatives in underdeveloped areas. This supplement

ARE's gift program of tools, books and other technical aids to individual recipients.

Credit.—Provision of means for saving and for low-cost credit for producers and consumers continued in 1956 to be one of the primary functions of co-operatives around the world.

In a partnership program with co-operatives, the government of India in 1956 launched its second five-year plan to provide state governments with national funds to purchase securities of co-operative credit societies. This would enable these societies to extend their aid to small farmers and other villagers. The partnership program also provided government training in management and other techniques for co-operative employees.

In North America, credit unions' membership rose to nearly 6,000,000 in 1956 with continued demand of consumers for low-cost credit and repositories for their savings. Credit unions did about 14% of the consumer loan business in the U.S.

The Rural Electrification administration in the U.S. lent \$190,000,000 to rural electric co-operatives in 1955-56, mainly for increased capacity for their distribution facilities. This brought the total of REA loans, mainly to co-operatives, to considerably more than \$3,000,000,000.

The REA also approved loans for the erection of three small co-operative power plants to be served by nuclear reactors. Approval for two of these plants, which would be the world's first co-operative atomic power plants, was granted by the Atomic Energy commission.

Marketing.—The National Grape Co-operative association in 1956 purchased the Welch Grape Juice Co., the world's largest grape processor. This purchase was made possible by an agreement between the association and Welch in 1952 for net proceeds of the company to be used for growers' purchase of Welch stock. U.S. farm marketing co-operatives collected, packed, shipped and processed at least 25% of the nation's food and fibre crops in 1956 and plans were laid for a nationwide dairy marketing co-operative.

In many parts of the world, as in Japan, Denmark and France, co-operatives marketed a much higher percentage of major crops than in the United States. Expansion of marketing facilities of co-operatives was one of the aims of the International Co-operative alliance's program for Asia and Latin America.

Farm Purchasing.—As part of their program of securing sources of raw materials for plant foods, U.S. farmer co-operatives in 1956 planned to mine phosphate rock in their holdings in Idaho and other western states. They also expanded production of nitrogen for fertilizer in Kansas and elsewhere, and added facilities of fertilizer processing and mixing plants in a number of states. These co-operatives handle a large percentage of fertilizer sold in the U.S., and process from 10% to 40% of their total distribution in 110 co-operative-owned plants.

Farmer co-operatives produced or distributed nearly one-quarter of U.S. feed, the 10th largest business in the nation. Their refineries, 2,000 oil wells and other facilities served them with petroleum products from their own sources. From 20% to 50% of the petroleum distributed in some rural areas was handled by co-operatives, which also served members with seed, machinery, hardware and other goods. Many also did grain, poultry and deer marketing and supplied their members with items needed for farming.

In most other parts of the world, farm supply purchasing was mainly at the distributive level in 1956, although increased industrialization in a number of Asiatic countries pointed the way toward co-operative production and processing of farm supplies on a broader basis.

Insurance.—Nationwide Mutual Insurance Co., largest group co-operatively oriented companies in the U.S., set up Nationwide corporation in 1956 to enable its policyholders and other

investors to purchase stock in other companies. Already the fourth largest auto insurance firm in the U.S. in its previous 13-state area, Nationwide became licensed to do business in half the states in 1956.

Insurance on a co-operative or mutual basis grew rapidly in 1956 along with the expansion of credit co-operatives in many parts of the world. In the U.S., co-operative-type firms served more than 12,000,000 families, including 1,700 farmers' mutuals, oldest form of co-operative in the nation.

Health.—The rapid growth of consumer-sponsored co-operative or group health plans in the U.S. and Canada continued in 1956. More of these plans started or proposed service facilities where their members could obtain health services from teams of doctors through prepayment of dues to the plan.

Consumer Goods.—Consumer co-operative organizations in western European countries, plus some in the United States, jointly formed a finance institution through which they hoped to obtain financing for expansion of their programs of distributing consumer goods.

Participating in the plan, headed by the general manager of the Swedish Co-operative Wholesale, were co-operatives in Great Britain, the Scandinavian countries, Belgium, the Netherlands, Switzerland and France. These co-operatives already were leading merchandisers in their respective countries, but felt the need for additional capital to compete on a sound basis with rapidly expanding commercial enterprises.

In Italy, a bank for financing bona fide co-operatives was set up in 1956 with the help of U.S. co-operatives and individuals.

Housing.—Two large unions and one credit union organization in New York city planned to use members' health and welfare funds to invest in better housing on a co-operative basis for members and other middle-income families. The Federal Housing administration appointed an assistant commissioner to supervise its program of mortgage insurance and technical aid to housing co-operatives.

(See also FARM CREDIT SYSTEM.)

(P. DE.)

Copper. In 1955, world production of copper was the largest ever, with the United States in the lead. Table I gives the world output in detail. The U.S. is not only the largest producer, but is also the largest consumer of copper in the world.

United States.—Despite long stoppages by labour strikes in mid-1955, the mine output of copper for the year was about 20% higher than in 1954. New three-year labour agreements were made in June 1956. In early Jan. 1956 Magma Copper company's San Manuel mine in Arizona produced blister copper one year ahead of schedule.

Research in the copper industry was emphasized by the U.S. bureau of mines and reserves were being evaluated in 1956. New sources of ore were sought. In Aug. 1956 the bureau reported that copper ores from Alaskan deposits, when treated by various standard ore-dressing methods, yielded commercial grade concentrates.

On May 10, 1956, the office of defense mobilization authorized

the General Services administration to negotiate with contractors for orderly delivery of about 40,000 tons of copper which had been deferred in 1954-55 to alleviate industrial shortages. In the first six months of 1956 the mine copper tonnage (653,470) and smelter tonnage (733,222) already exceeded those for the first eight months of 1956.

Chile.—Both Chuquicamata and Braden interests were expanding their copper operations considerably. The former, which had been processing copper ores by leaching, was in the sulphide zones and was beneficiating sulphide ores as well as oxide ores by flotation. The mine, entirely open pit until 1952, was in 1956 mining underground in addition to the open pits. Financed by the Export-Import bank, Cerro de Pasco Corp. was working on an exploration operation of copper at Rio Blanco.

Northern Rhodesia.—Chibulma mine, scheduled to produce about 18,000 tons of copper a year, was opened May 5, 1956.

Peru.—Development of copper at Toquepala advanced actively in 1955 and 1956. No output was expected before 1959 or 1960.

United Kingdom.—On July 2, 1956, the British board of

trade reported that it would sell 36,000 tons of copper from its stockpile between Aug. 15, 1956, and March 31, 1957.

ENCYCLOPÆDIA BRITANNICA FILMS.—Copper—Mining and Smelting (1950).

Corn. The 1956 U.S. corn crop was king-size, indicated 3,412,183,000 bu. valued at fully \$5,000,000,000; it was exceeded only by the 1948 crop of 3,605,078,000 bu.

Partly because of farm programs, farmers planted only an estimated 79,016,000 ac. to corn. Drought damage and soil

diversion to the soil bank reduced the harvested acreage to an indicated 77,596,000 ac., the lowest acreage for harvest since 1892. Under the acreage reserve phase of the soil bank, 320,400 ac. agreements were signed with corn producers covering 5,450,100 ac. on which a maximum of \$180,629,284 could be earned.

In spite of severe drought damage in portions of the western corn belt, a new record high yield of 44.0 bu. per harvested acre was indicated, breaking the previous 1948 record of 42.5 bu. per acre. Illinois had a fabulous average of 67 bu. per acre and for the second consecutive year exceeded the usual leading producer, Iowa.

WEED-FREE CORNFIELD in central Illinois, a demonstration plot showing the effect of a herbicide developed by the Monsanto Chemical company, was tested extensively in 1956. The manufacturers claimed that use of the chemical would eliminate all but a single cultivation of corn and soybean fields.

The average price to producers in October was \$1.19 per bushel, as compared with \$1.14 per bushel a year earlier. The official support price in the 840 counties of the commercial corn belt, first announced as \$1.40 per bushel (81% of parity) for those abiding by acreage allotments, was later revised to \$1.50 per bushel or 86.2% of parity for those planting within the corn base acreage or allocated acreage. For those in the commercial area not observing such restrictions a support at \$1.25 per bushel was offered. This was noted as the first time that a secretary of agriculture had granted a price support for farmers not complying with acreage restrictions in a "commercial" area.

A record carry-over of about 1,166,000,000 bu., plus the new crop, gave a record total supply for 1956-57 in excess of 4,575,000,000 bu. Consumption, because of smaller supplies of competing feed grains, was expected to exceed the 3,100,000,000 bu. used in 1955-56, in spite of a reduced number of hogs to be fattened. Nevertheless, it was anticipated that carry-over in Oct. 1957 would show an increase over 1956, most of it to be held by the Commodity Credit corporation. Farmers put 420,000,000 bu. of the 1955 crop under price support, as compared with only 257,000,000 bu. of the 1955 crop. A total of about 110,000,000 bu. were exported from the U.S. in 1955-56.

The world corn crop of 1956-57 was preliminarily indicated at a record high of 6,540,000,000 bu. as compared with 6,280,-

presidents in Panamá after visiting Puerto Rico, where he told a joint session of the legislature that Costa Rica could learn much from Puerto Rico's rapid economic development. Further travel plans were interrupted when his projected three-month trip to Mexico, France and Italy was temporarily blocked by the Costa Rican congress.

In anticipation of the May 1958 presidential election, the tempo of Costa Rican politics quickened. A government effort to minimize the influence of financial pressures on political parties through a plan requiring the government to bear all campaign expenses was opposed by former Controller General Armadio Quiroz, who said that since the turn of the century the "spoils system" had ruled Costa Rican presidential politics. Quiroz stated that inevitably the winners would pass a law recognizing only their own expenses and denying any reimbursement to the losers.

Coffee and fruit production, primarily in the Turrialba and Alajuela regions, was threatened by an invasion of the Mediterranean fruit fly. Officials were cautiously optimistic about efforts made to control the pest.

The Costa Rican fuel outlook was greatly brightened by an oil discovery in September. The Union Oil Company of California announced that it had completed a well in Limón province at a depth of 4,950 ft. which was flowing 1,000 bbl. per day. The strike was made on Union's 3,500,000-ac. Costa Rican concession adjoining its 350,000-ac. Panamá concession. U.S. concerns, exploring an adjacent region in Panamá, declared that their holdings may be part of the same oil basin.

(See also ORGANIZATION OF AMERICAN STATES; PANAMÁ.)

(R. HN.)

Education.—In 1954 there were 1,293 primary schools with 5,471 teachers and 137,941 pupils and 39 secondary and normal schools with 12,708 students. University education was available at the University of Costa Rica. The 5 daily newspapers had a circulation of 78,000 in 1952. According to the 1950 census, 21.2% of those 10 yr. of age and over were illiterate.

Finance.—The monetary unit is the colon, valued in 1956 at 17.64 cents U.S. currency, official rate, and at 15.04 cents, controlled free rate. The national budget for 1956 balanced revenue and expenditure initially at 259,822,300 colones. Actual revenue in 1955 was 261,750,030 colones; expenditure, 253,414,113 colones. The public debt on April 30, 1956, was 349,994,000 colones, of which 127,771,000 colones represented the external debt. Currency in circulation in May 1956 totalled 139,300,000 colones; demand deposits, 194,400,000 colones. The cost-of-living index (San José) stood at 107 in May 1956 (1953=100).

Trade and Communications.—Exports in 1955 amounted to \$78,927,000 (subject to final adjustment for revaluation of banana exports). Imports were \$87,508,000. Chief exports were coffee (47%), bananas (39%), cacao (7%) and abacá (1%). Leading customers were the U.S. (54%), western Germany (27%) and Canada (5%); leading suppliers, the U.S. (60%), Western Germany (9%) and the U.K. (7%).

Railway lines (1954) included 416 mi. of public railway and 388 mi. of private railway. In 1951 there were 930 mi. of all-weather roads and 3,725 mi. of dirt roads. Motor vehicle registration (Jan. 1, 1955) included 8,450 automobiles, 4,880 trucks and 947 buses. According to *Lloyd's Register of Shipping*, the merchant marine had 114 vessels (100 tons and over) aggregating 340,710 gross tons on June 30, 1955. Telephones (Jan. 1, 1955) numbered 10,901, none of which were automatic and 80% of which were located in San José.

Agriculture.—Exports in 1955 included coffee 430,528 bags of 132 lb. each, bananas 9,085,795 stems, cacao 9,696 metric tons, abacá 937 tons. Production in the 1954-55 season included coffee 564,000 bags, centrifugal sugar 28,000 tons, panela 33,000 short tons, cacao 24,969,000 lb. In 1954 there were 762,000 cattle, (1950) 112,156 hogs and 77,335 horses.

Manufactures.—In 1950 there were 1,267 manufacturing establishments with annual production valued at \$78,251,000. Most important were food and kindred products (26.8%), printing and publishing (23.4%) and apparel and related products (22.2%). Installed electric energy capacity in 1954 totalled 57,100 kw., largely hydroelectric; production (public use only) was 221,000,000 kw.hr. (J. W. Mw.)

Costa Rica. A Central American republic, Costa Rica is located between Nicaragua and Panamá. Area: 59,695 sq.mi.; pop. (1950 census), 800,875; (1955 est.), 970,000, classified as about 80% white, 16% mixed, 3% Negro and less than 1% Indian. The capital is San José (1950 census) 86,909; other principal cities are Alajuela, 13,903; Cartago, 12,944; Guadalupe, 8,452; Heredia, 11,967; Limón, 11,310; and Puntarenas, 13,272. Language: Spanish. Religion: predominantly Roman Catholic. President in 1956: José Figueres.

History.—In Jan. 1956, Costa Rican Ambassador Fernandoournier and Nicaraguan Ambassador Guillermo Sevilla Sacasa signed two pacts designed to forestall future hostilities between the two countries. The pacts provided for the establishment of a joint frontier surveillance committee composed of military officers and of a committee composed of foreign representatives with free access to all parts of both countries. The only incident which threatened to disturb this new era of peace was the arrest of Honduran Abraham Perry Baker, who attempted to enter Costa Rica from Nicaragua. Baker confessed that he intended to assassinate Pres. José Figueres, Vice-Pres. Blanco Cervantes, Archbishop Odio and other high-ranking officials.

In July, President Figueres attended the meeting of American

acreage allotment was 17,400,000, about 4% less than the 1955 allotment of 18,200,000 ac. Only an estimated 16,962,000 ac. of cotton were under cultivation on July 1, 3% less than the 17,-

Other states	43	50	47

506,000 ac. of cotton in cultivation July 1, 1955, and comparable with a ten-year average of 22,746,000 ac. Preliminary information on cotton acreage placed under the 1956 Acreage Reserve program of the soil bank indicated that about 1,064,000 ac. were signed up, almost four-fifths in Texas. Payments of approximately \$26,000,000 were anticipated.

In spite of considerable weevil damage and severe drought limitations on yields of dry-land cotton in large parts of Texas and Oklahoma, the average yield per acre of lint was 403 lb.

The 1956 crop of American-Egyptian long-staple type cotton produced under irrigation in the southwest was indicated at 47,200 bales, as compared with 32,900 bales average 1945-54. The acreage for harvest was 39,800 and the indicated yield 570 lb. per acre.

Marketing quotas having been overwhelmingly voted by cotton producers, the support price for 1956 crop middling $\frac{7}{8}$ -in. staple at average location was set at 29.34 cents per pound or 82½% of parity, as compared with 31.70 cents per pound or 90% of parity for the 1955 crop. Translated into one-inch length staple, the base used after Aug. 1 for trading on the New Orleans Cotton exchange, the equivalent support rate thereon was 32.74 cents per pound. American-Egyptian type was supported at 55.73 cents per pound. Market prices fluctuated generally rather close to the support price level.

The over-all supply situation continued to be one of embarrassing abundance. The end of the season carry-over on Aug. 1 was a new record high of about 14,100,000 bales, exceeding the previous record of about 13,000,000 bales set in 1939. Of the carry-over, about 9,900,000 bales were held by the Commodity Credit corporation, as compared with 8,133,000 bales in 1955 and as little as 79,000 bales in 1951. The carry-over plus the new crop equalled a record total supply of about 27,300,000 bales. However, there appeared some prospect that if domestic mill consumption in 1956-57 should approach the 9,200,000 bales of 1955-56 and exports should approach the hoped for 5,000,000 bale level, then the build-up in stocks would halt.

Exports were pushed more vigorously, first, early in the year by the sale of short-staple supplies at cut-rate prices, then, for shipment after Aug. 1, to the world market on a competitive basis, with bids acceptable at a level "comparable" to 25.5 cents per pound; cash equalization payments to exporters were announced at 6.58 cents per pound.

World Cotton Production and Trade.—The world cotton crop of 1956-57 was indicated at 38,930,000 bales as compared with 39,520,000 bales in the previous year and a pre-World War II average crop of 31,689,000 bales. The decrease was entirely in the free world, especially in the United States and Mexico; the Communist countries showed an increase to 9,415,000 bales from 8,702,000 bales in 1955 and 6,322,000 bales average prewar.

India in 1955-56, with exports of 504,000 bales, half of

which went to Japan, against imports of 427,000 bales, became a net exporter for the first time since partition. Pakistan reversed a trend of increasing consumption and declining export by shipping 716,000 bales, an increase of 13% over the previous year.

Mexico's cotton production in 1956-57 was estimated at 1,800,000 bales, as compared with 2,250,000 bales in the previous year. About 1,375,000 bales were indicated as available for export against record exports of 2,027,000 bales in 1955-56. Both Mexico and Brazil protested the cotton export program of the United States, the former instituting for a time a very controversial barter plan requiring payment in cotton for some imports.

Japan absorbed 873,000 bales of the 2,320,000 bales exported by the U.S. in 1955-56 and was expected to take more than 1,000,000 bales in 1956-57, partly under credit facilities made available by the Export-Import bank.

Table II.—Cotton Production of the Principal Producing Countries
(in 000 500-lb. bales)

Country	1956*	1955	Average, 1945-49	Average, 1935-39
United States	13,153	14,721	12,104	13,149
India	4,200	3,800	2,304	5,348†
China (including Manchuria)	1,939	2,855
U.S.S.R.	2,328	3,430
Mexico	1,800	2,250	577	334
Brazil	1,700	1,352	1,956
Egypt	1,523	1,535	1,456	1,893
Pakistan	1,400	1,420	1,024	...
Turkey	625	600	268	249
Argentina	550	525	427	289
Peru	500	500	308	379
Sudan	441	246	248
Uganda	300	227	281

*Indicated. †Includes Pakistan.

Linters.—An indicated production in 1956 of about 1,600,000 bales of this cotton cellulose by-product, plus a carry-over of 1,000,000 bales, and imports into U.S. of 200,000 bales provided the smallest supply since 1952-53, 2,800,000 bales against 3,400,000 bales in 1955-56. If disappearance in 1956-57 should continue as anticipated at the record rate of 2,200,000 bales achieved in 1955-56, year end stocks would be reduced to about 800,000 bales, lowest since 1952. Prices generally declined in 1955-56, most grades setting new postwar lows.

Cottonseed.—Indicated production in 1956 of this major oilseed crop, which results from ginning seed cotton, was 5,495,000 tons, as compared with 6,038,000 tons in 1955. The 1956 crop was supported at \$48.60 per ton, as compared with \$46.34 per ton in 1955.

Cournand, André Frédéric (1895-), French-U.S. physiologist, was co-winner of the 1956 Nobel prize in medicine with Dickinson W. Richards and Werner Forssmann (*qq.v.*) for pioneer research in the detection and treatment of heart disease. The official award citation of the Nobel prize committee stated that their research had made possible the diagnosis of cardiac disease "earlier and with greater certainty than before," thus increasing "the prospects of preventing further deterioration." Cournand, Richards and Forssmann shared the Nobel prize committee's cash prize of \$38,684.

Cournand, born at Paris, Fr., on Sept. 24, served in the French armed forces during World War I, receiving the *croix de guerre* with three stars. Emigrating to the United States, he

became a staff member of Bellevue hospital, New York city, in 1930 and later was appointed a chief resident. In 1935 he joined the faculty of the Columbia university college of physicians and surgeons, becoming full professor of medicine in 1951. During World War II he was an investigator with the U.S. Office of Scientific Research and Development. He was also named sectional chairman of the National Heart institute in Washington, D.C. Courmand became a U.S. citizen in 1941.

Describing the prize-winning research of Courmand and Richards, the Nobel prize committee's citation of Oct. 18, 1956, said that the awards had been made for "discoveries concerning heart catheterization and pathological changes in the circulatory system."

Crime. **United States.**—Crime-reporting procedures in the U.S. distinguish between part I and part II offenses. Categories of crimes that are most likely to be known to the police are included in the first group. Since most part II crimes become known only when arrests are made, crime statistics for these offenses on a national basis are not available.

While the population of the country had increased only 9% since 1950, part I crimes were 26% more prevalent in 1955 than in the former year. The 1955 crime rate was 15.9% greater than the 1950 rate.

While 1955 was the first year in eight not to register an increase in part I crimes, the decrease from 1954 was slight (only 2%) and the first half of 1956 experienced a 14.4% increase over comparable 1955 crimes. The increases and decreases in the several classes of part I crimes during both these periods were shown in Table I.

Table I.—Per Cent Change in Estimated Number of Part I Crimes Known to Police in 1955 Compared With Number in 1954, and in First Six Months of 1956 Compared With First Half of 1955

Part I crimes	Per cent change	
	1954-55	First half 1955-56
Murder and nonnegligent manslaughter.	0.0	4.0
Manslaughter by negligence	3.7	10.2
Robbery	5.9	6.8
Aggravated assault.	-14.7	-1.1
Burglary (breaking and entering)	-0.9	2.8
Larceny (theft)	-5.1	4.7
Auto theft.	1.5	18.5
Total.	5.2	22.3
	-0.2	14.4

Comparison of 1955 statistics with those of 1954 reveals that crimes against persons as a group increased while crimes against property as a group decreased in number. While both larceny and auto theft were commoner in 1955 than in 1954, their increased numbers were compensated for by greater decreases in robberies and burglaries.

It is interesting to note that, while crime rates increase with population concentration, the 1955 decreases in crime frequency were in urban areas and the greatest decrease was experienced in the group of large cities. While urban crime decreased 0.8%, rural crime increased 1.8%; while urban murders increased 1.7%, murders increased 3.1% in rural areas; while urban robberies decreased 15.3%, robberies decreased only 12% in rural areas.

This trend, favourable for the urban communities, did not continue during the first half of 1956. Comparison of the first six months of 1956 with the same period in 1955 shows that both urban and rural crime increased in approximately the same proportion: 14% for urban crime and 14.6% for rural crime. The

great increases in urban crime were found in the categories of rape (13.3%), larceny (18.1%) and auto theft (27.1%).

Crime statistics for 1955 continued to show that on the whole cities with greater populations have higher crime rates than the smaller communities. Comparisons of 1955 figures with those for 1954, however, show that an over-all decrease in crime was experienced only by the large cities as a group—those in excess of 250,000 population. Comparison of the first six-month period of 1955 with that of 1956 indicates that the crime rates of these large cities, as a group, increased in all categories except robbery, in which the crime rate was unchanged. On the whole, however, the crime rates of the smaller cities increased at an even greater pace.

Analysis of the 1955 increases and decreases from the 1954 frequency of types of crimes reveals changes. For example, a comparison of the frequency of robberies classified according to property attacked shows a consistent decrease in all categories (highway, commercial house, gasoline station, chain store, residence, bank and miscellaneous) except bank. The number of bank robberies increased from 122 to 142 during this time. Only 1.3% of robberies in 1955 were committed in dwellings, a 24.7% decrease from 1954. While the frequency of rape increased 8.7%, statutory rape decreased 4.6%. In the larceny class of crime, pocket picking, purse snatching and thefts from autos (except accessories) decreased by the following percentages, respectively: 15.2, 13.5 and 9; all other categories of larcenies increased in 1955. Of all residence burglaries in that year, 54.6% were committed at night.

The 1955 average loss per property crime, excluding auto thefts, was \$108 as compared with \$111 in 1954. The average robbery loss, however, increased from \$219 in 1954 to \$246 in 1955. Of all larcenies (excluding auto thefts), 72.6% involved thefts of less than \$50. This was approximately the same proportion as in 1954.

The per capita loss in property crimes including auto thefts in 427 cities amounted to \$3.82 in 1955, based on 1950 census figures. Recoveries of 56.8% (compared with 55.6% in 1954) held the unrecovered per capita loss to \$1.63.

Comparison of arrest data for 1954 and 1955 from 1,162 cities having a total 1950 population of 36,000,000 showed an increase of only 0.4%. Cities having more than 25,000 inhabitants reported a decrease of 0.7% while smaller communities experienced a 5.1% increase. There were no significant shifts in the distribution of arrests among the crime classifications. Drunkenness

POLICE CORDON searching a Long Island, N.Y., field for clues in the gangland killing of a hoodlum believed to be involved in the acid attack which blinded Victor Riesel (q.v.) in April 1956

continued to account for a substantial proportion of all arrests; 43.1% of all male arrests and 29% of all female arrests were for this offense.

The increasing frequency of juvenile crime was reflected in the greater proportion of persons arrested who were less than 18 years of age. This group accounted for 10.5% of all arrests in 1955 as compared with 9.7% in 1954. Of those younger than 18 years, 40% were under 15, which was approximately the same proportion as in 1954. Persons under 18 years of age accounted for 42.3% of the arrests for part I crimes; of these, 47.9% were under the age of 15.

The increase in the proportion of persons arrested for certain offenses who were under 18 years of age is apparent from the figures in Table II.

Table II.—Per Cent of Persons Arrested Under 18 Years of Age

Offense	Per cent under 18 1954	1955	Offense	Per cent under 18 1954	1955
Robbery	18.7	21.4	Rape	15.3	18.1
Aggravated assault	6.6	7.5	Narcotic drug law violations	2.4	3.6
Other assaults	5.9	6.8	Weapons law violations	13.1	16.8
Burglary	49.0	52.7	Liquor law violations	10.7	11.4
Larceny	43.6	46.9	Disorderly conduct	9.8	10.3
Auto theft	57.6	62.2			
Stolen property law violations	26.0	27.5			

(See also FEDERAL BUREAU OF INVESTIGATION; JUVENILE DELINQUENCY; LAW; SECRET SERVICE, U.S.) (O. W. W.)

England and Wales.—The decline in the total of indictable offenses known to the police continued in 1954 but was not maintained in 1955. A fall of 38,662 was followed by a slight rise of 3,758. There was also a slight decrease in the percentage of crimes cleared up from 49.2% to 48.7%. Broken down into types of offenses, this over-all rise showed an increase in larceny, receiving, sexual offenses and violence against the person, and a decrease in breaking and entering and in frauds and false pretenses.

Still comparing 1955 with 1954, there was an increase of 1% in the number found guilty of indictable offenses compared with 1.5% in the case of nonindictable offenses. Traffic offenses (dealt with summarily) comprised 55.5% of the total number of persons found guilty of offenses of all kinds. Larceny, at 9.3%, constituted the next largest group.

More motoring offenses were recorded in 1955 than ever before, a total of 643,855, and an increase of 5.8% over the previous year.

The general trend in the years following World War II for persons of all ages found guilty of indictable offenses was a rise to a peak in 1951 and then a decline. This rise was occasioned mainly by the increase in delinquency among children under 14 years, and the fall was greatest in this age-group. The sex differential (*i.e.*, ratio of male to female crime) shows the effects of the war to have been greater in the case of women, particularly among juveniles, than of men.

	1938	1951	1955
Total number of indictable offenses known to the police	283,220	524,506	438,085
Larceny	199,951	355,407	295,035
Breaking and entering	49,184	95,946	74,907
Frauds and false pretenses	16,097	27,415	22,966
Sexual offenses	5,018	14,633	17,078
Violence against the person	2,721	6,516	7,884

One of the most noticeable features of this table is the steady increase since 1938 of sexual offenses and offenses against the person.

Renewed attention during the year was given by the police to adult gangs particularly to those carrying on warfare among their members and operating so-called protection rackets from the racecourses.

(See also POLICE; PRISONS.)

(J. C. SR.)

Crowther, Geoffrey (1907—), British economist and journalist was born at Leeds, May 13. He was educated at Leeds grammar school, at Oundle and at Clare college, Cambridge, afterward studying at Yale and Columbia universities. After a period as economic adviser to the Irish banks' standing committee in 1932 he joined the *Economist*, where henceforward his main activities and influence were concentrated, and became assistant editor in 1935. In 1938 the paper's editorship devolved upon him. He combined this office with that of a director of the Economist Newspaper Ltd. and upon resigning as editor in March 1956 retained his connection with the organization as a managing director.

In April 1956 he was appointed London chairman of the Encyclopædia Britannica, bringing to this essentially Anglo-American enterprise a firm belief in the indispensability of the transatlantic alliance. This had been the cornerstone of his editorial policy at the *Economist*, where he had been responsible for introducing a detailed section on United States affairs.

During World War II Crowther advised the ministry of supply (1940-41) and the ministry of information (1941-42), and was deputy head of the joint war production staff, ministry of production (1942-43). He also edited *Transatlantic* from 1943 to 1945, was editor of *Europa Publications* from 1940 and its director from 1945 to 1950. His contributions to academic economics were *An Introduction to the Study of Prices* (with Sir W. T. Layton, 1935) and *An Outline of Money* (1941). He also published *Ways and Means* (1936), *Economics for Democrats* (1939) and *Ways and Means of War* (1940).

Crude Oil: see PETROLEUM.

Cuba. The large island and numerous small islands lying between 20° and 25° N. lat. and 74° and 85° W. long. constitute the republic of Cuba; the aggregate area under the sovereignty of the republic is 44,217 sq.mi. The census of 1953 disclosed a total population of 5,829,029. The capital is Havana, with 785,455 inhabitants in the city. Some of the suburbs comprising Havana's metropolitan area are quite large (Marianao 226,252, and Guanabacoa 104,957). Other large cities and their populations (1953 census) are Santiago de Cuba 163,237. Camagüey 132,059. Santa Clara 85,678, Guantánamo 83,684. Holguín 81,920, Cienfuegos 70,833, Matanzas 67,558, Sancti Spiritus 58,160 and Pinar del Río 46,182. There are 12 other cities with more than 25,000 inhabitants each. The final report of the 1953 census revealed that 57% (3,324,628) of Cuba's population live in cities and towns and 43% (2,504,401) in small villages and rural areas. By race, the report classifies 72.8% as white, 12.4% as Afro-American, 14.5% as mixed and 0.3% as Asiatic. There were 149,327 foreigners domiciled in Cuba in Jan. 1953, of whom 74,561 were Spaniards, 27,543 Haitians, 14,421 British (chiefly West Indians), 11,834 Chinese and 6,503 citizens of the United States.

History.—Fulgencio Batista was president throughout 1956. Early in the year, an abortive revolutionary movement culminated in the arrest and expulsion of former President Carlos Prío Socarrás. In October another plot was uncovered which was also attributed to Prío.

The year 1956 was one of relative prosperity in Cuba. Rain-fall in the sugar areas was below normal, so that many mills reported late in the year that they would not be able to fill their quotas for 1956-57 production. The quota base was the same as for 1955, 4,600,000 long tons, the first increase since 1952. Contrary to expectations, the carry-over into 1957 was the smallest in years. Prices, accordingly, were firm. Coffee was sold abroad in volume for the first time in ten years. New nickel developments in the province of Oriente competed with

the steadily expanding Nicaro mining enterprise. Oil in volume good quality was found at considerable depth in various places; one well near Havana averaged 520 bbl. daily. The Compañía Técnica Cubana began to operate a plant, built with a government loan, to manufacture newsprint from sugar cane residue (bagasse). A large enterprise of the United States established a substantial plant for the manufacture of glass containers.

Of the \$100,000,000 in bonds issued by the Bank for Economic and Social Development (known as "Bandes") in 1955 under the plan to issue \$350,000,000 as part of a four-year plan of economic diversification, only \$2,000,000 remained unallocated by June 1956. On June 13 a further issue of \$150,000,000 was authorized, and in the ensuing three months more than \$80,000,000 were allocated, mainly to urban and rural road construction and other public works.

By the end of the year, the task of organizing and consolidating the floating debts of Cuba, many years under way, was virtually completed. The floating debt incurred prior to 1940 had been sifted thoroughly and certified at about \$25,000,000, while that originating from 1940 to 1955 was expected to stand at less than \$80,000,000. It was believed that early in 1957 the total of approximately \$100,000,000 could be properly funded, so that Cuba for the first time in a generation would be rid of the worst menace to the stability of the currency, namely, floating debt. Consolidation operations and the public works programs of "Bandes" had increased the funded debt by 47%, or \$66,000,000 from Dec. 31, 1954, to Dec. 31, 1955, when the funded debt stood at \$581,800,000; and these two same factors could be calculated to bring the total somewhere between \$850,000,000 and \$900,000,000 by the end of 1957.

The foreign relations of Cuba were reasonably unperturbed during the year, apart from some acrimonious exchanges with the Dominican Republic. The president attended the meeting of American presidents in Panamá in July. Progress was made toward the conclusion of a treaty with the United States to eliminate the double taxation of income. (C. E. Mc.)

Education.—In the school year 1952-53 public primary schools had an enrollment of 634,924 and 23,163 teachers; private schools had 98,724 pupils. There were 21 institutes for secondary education with 26,413 pupils, 10 normal schools with 1,817 students; and 45 other schools with 11,545 students. University education was available at the University of Havana (18,379 students), Oriente university (Santiago de Cuba) (556), Santa Clara university (Santa Clara) (767) and the Catholic University of Villanova (Havana) (523).

Finance.—The monetary unit is the peso, officially pegged at par with the U.S. dollar. The budget for the fiscal year 1956-57 (July 1-June 30) was placed initially at \$330,149,470 (1955-56: \$312,874,863). On June 30, 1956, the consolidated public debt amounted to \$612,244,600. Currency in circulation (March 31, 1956) was \$385,000,000; demand deposits, \$1,000,000. The U.S. department of commerce estimated U.S. direct private investments in 1955 at \$723,000,000, of which public utility investments accounted for \$305,000,000. The cost-of-living index (Havana) was 149.8 in March 1956 (1953=100). National income was estimated at \$723,000,000 in 1954.

Trade and Communications.—Exports in 1955 totalled \$594,155,434; imports, \$495,528,237 (1954: \$487,880,770). Leading exports in 1955 were sugar (74%), tobacco and products (7%), molasses (6%), nickel (4%) and copper (2%). Leading customers were the U.S. (67%), the U.S.R. (6%), Japan (4%), western Germany (3%) and the Netherlands (3%); leading suppliers, the U.S. (71%), the Netherlands Antilles (3%), western Germany (3%) and Canada (3%). Leading import groups in 1954 included foodstuffs and beverages (31%), machinery, apparatus and vehicles (19%) and stone, earth, ore, glass and clay products (12%).

Railways (1949) included 3,017 mi. of main line, 660 mi. of sidings, yards and 7,870 mi. of industrial trackage. Roads (1949) included 10 mi. of paved highways and 600 mi. of improved highways. On June 30, 1956, there were 131,250 privately owned automobiles, 45,381 buses and 4,415 buses. Telephones (Jan. 1, 1956) numbered 142,359, 77 of which were located in Havana. There were (1954) 10 television stations and (1955) 200,000 television sets.

Agriculture.—Production of sugar in the 1955-56 season, limited by government decree, was 5,225,000 short tons; that of blackstrap molasses, 21,000 gal.; high-test molasses, 115,000,000 gal. Production estimates for other crops in 1955-56 included rice (rough) 400,000,000 lb.; coffee 90,000 bags of 132 lb. each; cacao 4,360,000 lb.; oranges 1,900,000 lb. of 70 lb. each; grapefruit 200,000 boxes of 80 lb. each; tobacco (1955) 104,683,000 lb.; henequen (1955) 19,300,000 lb. In 1951-52 there were an estimated 4,033,000 cattle, 1,286,000 pigs and 194,000 sheep.

Manufactures.—Production in 1955 included cement 423,600 metric tons;

rayon filament yarn 5,160 tons; beer 117,919,422 l.; alcohol 183,223,038 l.; rubber tires 101,069; tubes 46,994. Sales of electric energy by the one large company (representing about 90% of total production) were 1,020,424,000 kw.hr.; total installed capacity (1954) was 500,000 kw.

Minerals.—Copper production totalled 19,507 short tons in 1955. Exports included nickel 15,585 metric tons; manganese ore 258,442 tons; iron ore 122,506 tons; chrome ore 47,732 tons. Crude petroleum production was 1,013,999 gal. (J. W. Mw.)

ENCYCLOPÆDIA BRITANNICA FILMS.—*Caribbean Sky Cruise* (1955); *Cuba* (1955).

Curaçao: see NETHERLANDS ANTILLES.

Curling. The Mitchell medal, one of the most desired prizes in the sport, was won in 1956 by the Utica (N.Y.) club's no. 1 rink, skipped by Roy Read. A quartet from Huntsville, Ont., led by Wally Irwin, won the Allen medal. The Country Club cup, third-place award, went to the Utica no. 2 team, skipped by Proctor Eldred, Jr. E. J. Belanger's Nashua (N.H.) four overpowered Midland, Ont., for the Dewar cup.

Play for the Gordon grand national champion rink medal took place at Schenectady, N.Y., Feb. 10-13. Top honours in the 87-year-old competition went to the Utica no. 2 team, skipped by Fred Parkinson. The Emmet consolation was won by Mahopac, N.Y., and the Mohawk consolation by the Ardsley Curling club (N.Y.). The 20th tournament for the Douglas medal was held at Mount Hope, N.Y., Jan. 13-15, and the big prize went to the Toronto Granites. St. Andrews no. 3, defeated Russell Weston's Ardsley no. 3 team in the Griffith medal consolation play.

St. George Curling club of Montreal, headed by Fred Rubbra, captured the big prize in the 70th annual international at Detroit, Mich., Jan. 5-8, 1956. The Galt (Ont.) side outscored Hamilton (Ont.) for the Detroit cup, and the Erwin Palmer trophy went to Hugh St. Clair's four from Milwaukee. Twenty U.S. teams met 20 Canadian rinks in opening-round play on a total-score basis, and the U.S. took the Ahern trophy for the first time, winning 199-165.

The eighth annual national championship of the United States Women's Curling association was held at the Chicago Curling club in Northbrook, Ill., and the Indian Hill club at Winnetka, Ill., Feb. 14-17. The three-year reign of the Wauwatosa (Wis.) Nell Granites club rink came to an end when the Chicago Heathers took top honours. The Heathers also won the Appleton and Indian Hill prizes; Wauwatosa won the Exmoor trophy; and the Indian Hill Squaws gained the Skokie award.

The first international bonspiel for teen-agers took place at Utica, Dec. 17-18, 1955, and Brockville (Ont.) no. 2 was victor. Utica no. 2 led the second group, and Morrisburg (Ont.) won the third group prize. All records for schoolboy play went overboard during the 1955 Christmas holidays at Winnipeg, Man., when 230 rinks competed in the annual province-wide bonspiel. The Kenora (Ont.) rink triumphed.

Playoffs were necessary to decide the annual playdowns for the Canadian championships at Moncton, N.B., early in March. High mark of the big bonspiel came in the crucial game for MacDonald's Brier Tankard when Billy Walsh, Manitoba skip, broke a 7-7 deadlock to conquer Ontario. Central Collegiates of Regina, Sask., won the schoolboy playoff.

Other winning teams, with skips in parentheses, included the following:

St. Paul (Minn.) international—St. Paul (A. E. Venables).
Winchester (Mass.) international—Fredericton, N.B. (Art Limerick).
Portage (Wis.) mixed—Portage club (Harold Sommers).
Brookline (Mass.) women's international—the (Brookline) Country Club (Mrs. U. H. Crocker).
Rankin trophy—Montreal West (Peter Millar).
Duluth (Minn.) international—Ft. William, Ont. (Bob Murray).
Midwest championship—Portage Curling club (K. Lauterbach).
Lake Placid (N.Y.) international—Granite Curling club, Toronto (C. R. Mills).
Lake Placid mixed bonspiel—Sudbury, Ont. (Charles Jessup).
(T. V. H.)

Currency: see COINAGE; EXCHANGE CONTROL AND EXCHANGE RATES. See also under various countries.

Cycling. The 1956 United States senior open title was won by Jack Disney of Altadena, Calif., for the third consecutive time. The women's national title went to Nancy Nieman of Detroit, Mich., and the junior open crown was carried off by Dave Staub of San Francisco, Calif. Billy Zisa of New Milford, N.J., took the New York city, New Jersey state, New England states and national juvenile championships. Ted Smith of Buffalo, N.Y., won U.S. all-around honours at Hartford, Conn., Sept. 2 when he finished $\frac{1}{10}$ sec. ahead of Art Longsjö of Fitchburg, Mass. The 13th annual 50-mi. tour of Somerville, N.J., on May 30 was won by Jackie Heid of Rockaway, N.Y. He led a field of 136 riders, scoring by only 2 ft. over Ted Smith. Al Stiller of Chicago took a 50-mi. national event at Patchin, N.Y., and Sal Barone of Brooklyn, N.Y., won a 50-mi. test at Comack, N.Y. Olympic trials in California in September produced top performances, including a new national record of 1 min. 13.5 sec. for 1,000 metres set by Allen Bell of the U.S. navy. (See also OLYMPIC GAMES.)

World Championships.—Copenhagen was the scene of several world title races. Frans Mahn (Neth.) won the amateur road championship there on Aug. 25, with Michel Rosseau of France earning amateur sprint honours four days later. Reg Harris (Great Britain) won the international professional grand prix for the third straight time on Aug. 5. Antonio Maspes of Italy, was world professional sprint ruler and Rik Van Steenbergen (Belg.) took the professional road title. On Aug. 6, a U.S. cyclist, Jeanne Robinson of Detroit, set a women's track record of 15.2 sec. for 200 metres from a flying start at Alexandria Park stadium in Portsmouth, Eng.

Tour de France.—This grind of 2,765 mi., which extended over 24 days with stops in 22 cities, was won in 1956 by Roger Walkowiak, a Frenchman of Polish descent, who led Gilbert Bauvin of France by 1 min. 25 sec. Stan Ockers of Belgium won the 5-day Grand Prix of Nations race that ended in Rome on April 29, and Bernard Gauthier of France won the annual Bordeaux-to-Paris road event of June 3. (T. V. H.)

C.Y.O.: see SOCIETIES AND ASSOCIATIONS, U.S.: *Catholic Organizations for Youth.*

Cyprus. This British island colony and strategic base in the eastern Mediterranean is about 40 mi. from the southern coast of Turkey. Area: 3,572 sq.mi. Pop. (1946 census) 450,114 (80.8% Orthodox Greeks, 17.7% Moslem Turks); (1955 est.) 520,000. Chief towns (pop., 1954 est.): Nicosia (cap.) 42,000; Limassol 27,300; Famagusta 20,900; Larnaca 16,600. Governor in 1956: Field Marshal Sir John Harding.

History.—The terrorism which began in 1955 continued throughout the early months of 1956. Negotiations between the governor, Field Marshal Sir John Harding, and Archbishop Makarios proceeded and at the end of February the British colonial secretary, A. Lennox-Boyd, flew to the island to meet the archbishop and the Turkish leaders. On his return to London the colonial secretary announced in the house of commons that the archbishop had seen the text of a statement he proposed to issue, setting out the British government's policy on Cyprus. This document stated that it was not the British government's position that the principle of self-determination should never be applicable to Cyprus. It was the government's position that it was not at that time a practical proposition on account of the situation in the east Mediterranean.

The colonial secretary went on to say that the British government was in favour of a wide measure of immediate self-

government and was ready to send a constitutional commission to the island to draft a constitution, but the archbishop was not prepared to associate himself with the statement, although he was ready to co-operate in framing a constitution when satisfied on certain points relating to the amnesty it was proposed to declare, and in regard to the Greek elected majority under the proposed constitution. Since the archbishop was not satisfied the negotiations had broken down. There followed the deportation of the archbishop and the Bishop of Kyrenia to the Seychelles, the government of Cyprus declaring that it had evidence that they were deeply implicated in the campaign of terrorism started by the organization EOKA (*Ethniki Organosi Kypriakou Agonos*, or National Organization of Cypriot Struggle). During the debate on this action in the house of commons the prime minister said that the most culpable aspect of the archbishop's conduct had been his failure to condemn terrorism publicly.

During June the governor of Cyprus went to London for further discussions about the future of Cyprus. The chief of the British imperial general staff, Gen. Sir G. Templer, then visited Ankara, presumably to ascertain the views of the Turks. On his return the prime minister stated that though the principle of self-determination had been accepted, the problem was how it could be applied so as to protect the interests not only of Greece and Britain but of Turkey. As it had proved impossible to obtain an international agreement, he said, it had been decided that for the present no progress by these means could be realized. On the other hand it was decided to send Lord Radcliffe to Cyprus immediately to make recommendations on a new liberal constitution for the island, including safeguards for the interests of all communities.

Shortly afterward, EOKA announced that to prevent further bloodshed and to help achieve a settlement, it had ordered the cessation of hostilities. The governor replied that the members of EOKA might surrender with their arms within three weeks and decide whether to be evacuated to Greece or to remain in Cyprus. In the latter event they would be detained during the emergency but would not be tried for any terrorist offense unless the government had evidence that they had committed violence against the person. This offer was rejected by EOKA, and violence began again with renewed intensity. During April 1956 Oct. 1956 165 persons lost their lives, including 51 British servicemen and the U.S. vice-consul in Nicosia.

(See GREECE; MAKARIOS III.)

(B. A. C. S.-E.)

Education.—Schools: primary (1953-54) 730, pupils 67,994; (1955 secondary 57, pupils 19,660; agricultural 2; trade 1; teacher training colleges 2, students 320.

Finance and Trade.—Monetary unit: piatra (64.3 piastras = \$1 U.S. Budget (excluding development fund, 1955 revised est.): revenue £11,431,521, expenditure £11,135,285. Foreign trade (1955): imports £30,420,000, exports £18,239,000. Main products and exports (1955, in metric tons) pyrites 970,635, asbestos 12,843, copper 2,851; also citrus, carobs, wild olives, potatoes.

Czechoslovakia. A people's republic of central Europe. Czechoslovakia is bounded west and northwest by Germany, north and northeast by Poland, east by the U.S.S.R., south by Hungary and Austria. Area: 49,354 sq.mi. (including autonomous Slovakia, 18,902 sq.mi.). Pop. (1947 census): 12,164,095 (including Slovakia 3,402,300); (1955 est. 13,089,000 (including Slovakia 3,750,000). Language (1955 est. Czech 65.4%; Slovak 27.7%; German 1.4%; Hungarian 3.1%; Ukrainian 1.4%; Polish 0.7%. Religion (1930 census): Roman Catholic (Latin rite) 73.5%; Protestant (all denominations) 7.7%; Czechoslovak Church 5.4%; Greek Catholic 4%; Greek Orthodox 1%; Jewish 2.4%; atheist 5.8%. Chief towns (pop. 1947 census): Prague (cap.) 922,284; Brno 273,127; Moravia Ostrava 180,960; Bratislava 165,134; Plzen Liberec 117,811. First secretary of the Communist party of Czechoslovakia

1956, Antonin Novotny; president of the republic, Antonin Zapotocky; chairman of the council of ministers, Vilem Siroky.

History.—On Jan. 1, 1956, Czechoslovakia embarked on its second five-year plan, which called by the end of 1960 for an increase in gross industrial production of at least 50% (61.5% in Slovakia), and in agricultural production of roughly 30% (39.8% in Slovakia). Despite a planned increase in consumer goods the emphasis remained on heavy industry.

According to the Central Trades Union council, all industries except heavy engineering were still abreast of their aims at the end of September. However, throughout the year coal production remained a problem, mainly because of a shortage of manpower and high absenteeism, and by mid-October the situation was admitted to be serious.

In agriculture the collectivization drive was vigorously pursued, but with persuasion rather than threats. It was claimed in September that 56% of all villages had some form of co-operative and cultivated more than one-third of the arable land. The State Statistical office's half-yearly report had stated that 46.5% of all arable land was farmed by the "Socialist sector" (*i.e.*, producers' co-operatives and state farms). The 1956 grain and potato harvests were said to be good but throughout the year the press published complaints about food supplies and, particularly, meat shortages. In the annual price reductions on April 1 basic foodstuffs were reduced only slightly, if at all. However, supplies of food and consumer goods, although still unsatisfactory, slowly improved. A new National Insurance act published in October, increased sickness benefits and pensions. On Oct. 1 the standard working week was reduced to 46 hours.

Trade relations were greatly extended, particularly with underdeveloped countries, and Czechoslovakia exhibited at a number of middle and far eastern, as well as European, trade fairs. A trade agreement with Great Britain was signed on Oct. 22.

In the political field, the Communist party and government showed some skill in handling the situation produced by the 20th congress of the Communist party of the Soviet Union. Since the "personality cult" had never been seriously practised in Czechoslovakia, no major changes of leadership were called for; the only casualty was Alexei Cepicka, minister of defense (son-in-law of former Pres. Klement Gottwald), who subsequently reappeared as chairman of the Office for Inventions and Normalization.

The apparent freedom to criticize allowed by the new party line was fully exploited by both writers and students. At the 2nd congress of Czechoslovak writers in April several speakers were so bitterly critical of the methods of Communism that Pres. Antonin Zapotocky, himself a novelist, had to administer a sharp rebuke. In May students of Prague and Bratislava universities staged demonstrations ridiculing the Communists and drew up lists of demands for greater freedom, political as well as academic, which they succeeded in circulating widely.

In June a special Communist party conference, originally summoned to discuss the new five-year plan, gave government and party leaders an opportunity to warn the country as a whole that the new freedom to criticize was strictly limited, and excluded the party, the Soviet Union and Communism as such. One result of this conference, however, was a bill designed to give greater autonomy to the Slovak governmental organs, approved by parliament on July 30.

Czechoslovakia remained outwardly quiet throughout the Polish changes and the Hungarian revolution, and every medium of propaganda declared the country's unshakable allegiance to the Soviet Union. The number of alleged spies arrested at this time, and Zapotocky's broadcast warning on Nov. 3 that "we shall not allow anyone to threaten our Socialist system by any demagogic slogans, demands or pretexts whatsoever," nevertheless betrayed

nervousness about the state of feeling in the country.

(B. S. N.)

Education.—Schools (1953): nursery, pupils 165,000; primary 9,045, pupils 1,030,000; higher primary 2,745, pupils 473,000, secondary 304, pupils 80,300; vocational, pupils (1956) 139,000; institutions of higher education (1956) 17, students 48,000. There were also Hungarian, German, Ukrainian and Polish schools.

Finance.—Budget (koruny, 1956 est.): revenue 90,304,200,000; expenditure 89,886,900,000, including 48,092,700,000 (53.5%) invested in the national economy. Monetary unit: koruna with official exchange rate, high and fictitious, of 7.20 koruny to the U.S. dollar.

Foreign Trade.—UN Economic Commission for Europe's estimates, in U.S. dollars, 1954: trade turnover with all countries: \$1,940,000,000, including \$1,450,000,000 with the countries of the Communist group.

Transport and Communications.—Highways (1955): 43,718 mi. Licensed motor vehicles (Dec. 1955): cars 105,000, commercial 73,000. Railways (1947): 8,161 mi. Air transport (1953 est.): 1,689,000 km. flown; 20,541,000 passenger-kilometres. Telephones (1954 est.): 350,700. Radio receiving sets (Dec. 1952): 2,717,000, including 320,000 in Slovakia.

Agriculture.—Main crops (metric tons, 1934–38 average; 1948–52 in parentheses): wheat 1,513,000 (1,486,000); barley 1,109,000 (1,060,000); oats 1,212,000 (966,000); rye 1,568,000 (1,230,000); potatoes 9,635,000 (6,780,000); sugar beets 4,664,000 (4,253,000). Livestock (1938; latest estimates in parentheses): cattle 4,376,000 (1954: 3,840,000); pigs 3,538,000 (1953: 3,456,000); sheep 533,000 (1953: 1,110,000); horses 662,000 (1950: 640,000).

Industry.—Production (metric tons if not otherwise stated, 1937; 1955 in parentheses): coal 16,672,000 (22,100,000); lignite 17,895,000 (40,700,000); coke 3,280,000 (7,000,000); electricity 4,115,000,000 (15,000,000,000) kw.hr.; iron ore 1,800,000 (2,500,000); pig iron 1,675,000 (3,000,000); steel 2,301,000 (4,500,000); cement 1,273,000 (2,900,000); sulphuric acid 166,000 (384,000); motor vehicles 8,200 (14,700) lorry units (one lorry unit = three passenger cars); tractors (1955) 12,300 units; cotton fabrics (1955) 340,300,000 m.; sugar 604,000 (658,800).

Dahomey: see FRENCH UNION; FRENCH WEST AFRICA.

Dairy Products. Total U.S. milk production in 1956 was in excess of 127,000,000,000 lb., about 3% above the 1955 record of 123,500,000,000 lb. It was produced by 20,998,000 milk cows, the fewest in the last quarter century. Average production per cow in 1956 exceeded 6,000 lb. for the first time.

For the first eight months of 1956 the price of whole milk to producers averaged \$4.00 per hundredweight as compared with \$3.87 for the same months of 1955. Because of larger production cash receipts were about 10% higher than in 1955, but higher production costs reduced the net increase. Milk sold directly by farmers to consumers increased slightly to 21.1 cents per quart in September, as compared with 20.9 cents a year earlier. Government support prices on manufacturing milk were increased to \$3.25 per hundredweight for the year April 1, 1956, to March 31, 1957, as compared with \$3.15 per hundredweight during the preceding year. Buying prices for manufactured products were raised accordingly.

Preliminary indications were that butter production in 1956 would utilize slightly more than 31,000,000,000 lb. of milk, turn out 1,590,000,000 lb. of butter and supply at least 9 lb. for consumption per person. Production of creamery butter during the first 7 months of 1956 was 911,000,000 lb. as compared with 899,000,000 lb. during the same months of 1955. The butter buying price of the Commodity Credit corporation (C.C.C.) was increased by 2 cents to 58.6 cents per pound after March 31, about 81% of parity. Government purchases during the first part of the marketing year approximated those for the same period of 1955, yet butter stocks held by the C.C.C. on Aug. 31 were only 61,822,000 lb. as compared with 268,776,000 lb. a year earlier. For the year ended April 1, 1956, margarine sales were slightly below the preceding year, whereas consumers used 4% more butter than in 1954–55. During the calendar year per capita consumption was indicated as 9.0 lb. of butter and 8.0 lb. of margarine.

Cheese production January through July 1956 was 887,000,000 lb. of all types of cheese as compared with 869,000,000 lb. for the same months of 1955. Consumption was indicated at 7.8 lb. per person. Holdings of the C.C.C. were reduced to 278,635,000

lb. as of Aug. 31, as compared with 365,957,000 lb. a year earlier. The much discussed dairy import quotas for 1955-56 included cheese limits by types as follows: cheddar, 2,777,500 lb.; edam and gouda, 4,599,492 lb.; blue mould, 4,164,007 lb.; Italian types, 9,199,201 lb.

Production of evaporated milk declined moderately, but ice cream increased to 392,000,000 gal. for the first 7 months of 1956, as compared with 371,000,000 gal. for the same period of 1955.

Milk Production in Principal Producing Countries
(In millions of pounds)

Country	Preliminary 1956	1955	1954	Average, 1946-50
United States	127,000	123,554	122,294	117,297
France	39,400	40,406	40,903	27,256
Western Germany	38,100	37,273	37,595	24,993

Argentina	11,200	11,183	10,589	7,762

Source: U.S. Department of Agriculture.

The post-World War II upward trend in world milk production continued in 1956, with increases especially in North America and Oceania. Production in 22 primary producing countries in 1956 was estimated at 381,000,000,000 lb., 2% more than in 1955. Utilization as fluid milk increased to 37.6% of the total in 1955, 2% more than in the previous year. Diversion of milk to butter manufacture dropped to 34.9% of the total, from 35.9% in 1954. World utilization for cheese manufacture declined slightly to 11.8% of the total, and production of evaporated, condensed and powdered milk increased, as did feeding to live-stock. Apparently butter production, which had declined in 1955, increased in 1956 as did production of cheese and dried milk.

ENCYCLOPÆDIA BRITANNICA FILMS.—*Milk* (1955).

Dakar: see FRENCH WEST AFRICA.

Dams. Construction of dams for the optimum development of water resources proceeded at an increasing pace during 1956. Table I lists 15 of the important dams of the world under construction or completed during 1956. World-wide attention was focused on the controversy over financing the 360-ft. Aswan

high dam on the Nile river in Egypt. The withdrawal in July of offers of financial assistance by the United States and Great Britain was purported to be one of the contributing factors in Egypt's nationalization of the Suez canal, which, in turn, contributed to the precipitation of fighting in the middle east. The dam as planned would be located approximately 4 mi. upstream from the existing Aswan dam, and would be the world's largest rock-fill dam.

In Northern Rhodesia, at Kariba dam the 30-ft. by 40-ft. diversion tunnel was completed in 1956. The 420-ft. high, 1,800-ft. long concrete arch dam would harness the great Zambesi river at Kariba gorge 250 mi. below Victoria falls and would create the world's largest man-made lake.

In the United States, on the Columbia river, construction was undertaken in 1956 on the 175-ft. high Priest Rapids dam, one of the projects under the federal government policy which favoured development of water resources in partnership with local agencies. Downstream, at the Dalles dam, the most critical phase of construction was passed in Oct. 1956, with closure of the dam ahead of schedule despite a 10-day shutdown during the winter caused by severe cold weather and the necessity of flooding cofferdams during the heavy spring runoff. On the Snake river, tributary to the Columbia, the 395-ft. high Brownlee dam of the Idaho Power company's three-dam Hell's Canyon project was under way in 1956, despite continued efforts of the proponents of government ownership of power facilities to have the Federal Power commission licence withdrawn in favour of the proposed government-owned single high dam project.

On the Missouri river, at Oahe, the world's largest rolled earth-fill dam, slides occurred in the left abutment area involving approximately 5,000,000 cu.yd. of material in an area approximately $\frac{1}{4}$ -mi. long by $\frac{1}{2}$ -mi. wide. In order to speed the work of lining the downstream half of the outlet tunnels, the unusual feat was undertaken of moving the concrete batch plant bodily 2 mi. from the upstream to the downstream location.

On the St. Lawrence river, between the United States and Canada, at the St. Lawrence International Hydro-electric Development, first-stage construction was completed at the Long Sault and Iroquois dams in Oct. 1956, permitting the closure of the main river channel and the diversion of the full flow of the river through the completed portions of the dams.

In Brazil, on the Rio Grande, the 220-ft. high, 1,725-ft. long,

SAKUMA DAM on the Tenryu river, Japan, under construction in 1956. The completed structure would furnish 350,000 kw. of electric power and would be the tallest dam in Japan, and seventh tallest in the world

Peixoto concrete dam was well under way in 1956. The dam is a unique combination of straight gravity spillway and powerhouse intake structures adjacent to the right and left abutments, respectively, and an arch dam across the deep central portion of the channel between thrust blocks at the river ends of the two gravity sections. The Tres Marias dam, 230-ft. high, 8,600-ft. long, on the São Francisco river, was also under construction.

In Switzerland, construction progressed on the Grand Dixence and Mauvoisin concrete dams, on the Dixence and Dranse rivers, respectively. Grand Dixence, a gravity dam, to be completed initially to a height of 584 ft., was planned ultimately to extend to a height of 922 ft. The Mauvoisin dam, an arch dam, would be 780-ft. high.

In Australia, on the Eucumbene river in New South Wales, the Adamina dam was under construction in 1956, a 390-ft. high, 1,500-ft. long earth and rock fill.

In India, at the Bhakra dam on the Sutlej river, the 215-ft. high upstream cofferdam was completed during the summer of 1956 and pouring of concrete on the 680-ft. high gravity dam was started in Nov. 1956. At the Damodar Valley project, Maithon dam, a 162-ft. high, 12,500-ft. long earth-fill dam on the Barakar river, was practically complete in 1956. Also the 133-ft. high, 16,870-ft. long, Panchet Hill earth-fill dam was under construction in 1956.

In Japan, on the Tenryu river, Sakuma dam, a 504-ft. high, 965-ft. long concrete gravity dam, was practically complete in 1956.

ENCYCLOPÆDIA BRITANNICA FILMS.—*Water Power* (1937).

Dance. **Ballet.**—During 1956 there was a phenomenal increase in international exchange of dance companies. Under the sponsorship of the United States state department, which allocated more than \$1,000,000 to dance groups under its cultural exchange program, U.S. companies toured Europe, South America, the near east and Asia.

The New York City Ballet appeared at the Salzburg festival, made its Vienna debut, danced in Italy, Germany and Belgium and planned performances in France and Scandinavia. Ballet Theatre, which completed a South American tour late in 1955, revisited London and made its first appearance in Yugoslavia, Greece and Turkey. Martha Graham and her modern dance company toured Japan, Korea, the Philippines, Indonesia, Burma, Pakistan, India and Iran. Tom Two Arrows presented songs and dances of the American Indian during an extensive tour of south Asia.

The Royal Danish Ballet, custodian of a unique choreographic tradition dating back nearly 200 years, made a triumphant American debut. Two groups from Yugoslavia revealed that country's rich folk dance heritage. Dance Theatre Berlin, Antonio and his Spanish ballet, the Azuma Kabuki dancers from Japan, Lycette Darsonval's Paris Ballet and Marcel Marceau were among other visitors to the United States from abroad.

The Bolshoi Theatre Ballet of Moscow danced for a month in London, appearing outside Russia for the first time in its two centuries of existence. Curiosity and anticipation were so great that ticket seekers formed a queue three days before the opening of the box office. The supreme artistry of Galina Ulanova, the prima ballerina, made a profound impression.

Folk dance companies from the U.S.S.R. and Hungary played in London, while the Stanislavsky Ballet, of Moscow, appeared in Paris, indicating the increasing willingness of the "iron curtain" countries to exhibit their dance arts in the west.

Unfortunately, few new works of permanent value were produced by U.S. dance companies. Constant touring made the creation of large-scale ballets difficult or impossible; New York seasons were brief and sometimes poorly supported. An enormous potential audience was revealed when a telecast of Sadler's Wells Ballet in *The Sleeping Beauty* attracted an estimated 30,000,000 viewers. Enthusiasm ran high for the Royal Danish Ballet, which drew capacity audiences.

An auspicious sign was the trend toward the establishment of regional ballet companies. The first Southern Ballet festival, held in Atlanta, Ga., presented companies from Birmingham, Charlotte, Jacksonville, Tampa and Miami. The San Francisco Ballet made its east coast debut and was selected for a tour of the orient under state department auspices.

United States.—The New York City Ballet, directed by Lincoln Kirstein and George Balanchine, produced *Souvenirs* and *The Still Point*, choreographed by Todd Bolender to scores by Samuel Barber and Claude Debussy; *The Concert*, a satirical work by Jerome Robbins, music by Frédéric Chopin; and Balanchine's *Pas de dix*, music from Alexander Glazunov's *Raymonda*. *Jeux d'enfants* was an unsatisfactory attempt to encourage choreographic talent within the company. During a Mozart festival in Stratford, Conn., Balanchine staged *A Musical Joke* and a revised version of *Caracole*.

Maria Tallchief, prima ballerina, withdrew in the autumn because of illness. Principal dancers were Tanaquil LeClerq, Diana Adams, Patricia Wilde, Melissa Hayden, Yvonne Mounsey, Jilana, André Eglevsky, Nicholas Magallanes, Herbert Bliss, Roy Tobias, Jacques d'Amboise, Bolender and Francisco Moncion.

The American classic style developed by Balanchine in the New York City Ballet was hailed in Europe as an important contribution to ballet.

Ballet Theatre, during its New York season, produced *Rib of*

Eve, choreographed by Agnes de Mille, music by Morton Gould. Antony Tudor's *Offenbach in the Underworld* and Robert Joffrey's *Pas de Déesses* were added to the repertory. Tudor's *Undertow* and *Dim Lustre* were revived. Erik Bruhn resigned from the Royal Danish Ballet to become Ballet Theatre's *premier danseur*. Leading artists included Nora Kaye, Rosella Hightower, Lupe Serrano, Ruth Ann Koesun, John Kriza, Hugh Laing and Scott Douglas. More stimulating than the ambitious, expensive *Rib of Eve*, produced by the parent company, were experimental ballets by Harry Asmus, Katherine Litz, Job Sanders and Joffrey, seen at a Ballet Theatre Workshop performance.

Ballet Russe de Monte Carlo toured the United States and danced at the Lewisohn stadium, New York city. Its only new ballet was *Sombreros*, choreographed by Leon Danielian to Mexican folk tunes. Alicia Alonso and Igor Youskevitch headed the company, with Nina Novak, Irina Borowska, Gertrude Tyven, Yvonne Chouteau and Alan Howard.

The Royal Danish Ballet, during a six-week tour, presented many ballets new to the United States: Auguste Bournonville's *La Sylphide*, *Konservatoriet*, *Napoli* and *La Ventana*; Frederick Ashton's *Romeo and Juliet*; and the oldest ballet still danced in its original choreography, Vincenzo Galeotti's *The Whims of Cupid*, staged in 1786. The brilliance and virtuosity of the men's dances and the excellent dance-acting made a vivid impression. Dancers included Mona Vangsaa, Margrethe Schanne, Inge Sand, Mette Mollerup, Kirsten Ralov, Kirsten Simone, Borge Ralov, Niels Bjoern Larsen, Svend Erik Jensen, Frank Schaufuss, Fredbjoern Bjoernsson, Stanley Williams and Henning Kronstam, with Vera Volkova as artistic director.

For the Metropolitan Opera Ballet, Zachary Solov choreographed *Soirée*, with music by Benjamin Britten after Gioacchino Rossini, costumes by Cecil Beaton. Mary Ellen Moylan, Carmen de Lavallade and Oleg Briansky were featured dancers. Tudor was appointed director of the Metropolitan Ballet and Mattlyn Gavers ballet mistress, Solov remaining as principal choreographer. Anna Sokolow was choreographer for the New York City Opera.

For performances at the Juilliard School of Music, Doris Humphrey choreographed *Theatre Piece No. 2*, danced by José Limon's company, music by Otto Luening. Limon staged *Variations on a Theme*, music by Norman Dello Joio. William Schuman's *Symphony for Strings*, choreographed by Limon, was presented. The Juilliard Dance Theatre appeared in works by Humphrey and Limon.

At the Empire State Music festival, Ellenville, N.Y., Limon choreographed *The Emperor Jones*, with a score by Heitor Villa-Lobos. The American Dance festival at New London, Conn., presented works by Humphrey, Limon, Sokolow, Birgit Akesson, Ruth Currier, Margret Dietz, Pauline Koner and Alwin Nikolais.

At the Jacob's Pillow festival, directed by Ted Shawn, the San Francisco Ballet made its east coast debut, dancing Balanchine's *Concerto Barocco* and six ballets by its director, Lew Christensen. Sally Bailey, Nancy Johnson and Conrad Ludlow led the dancers, with James Graham-Lujan as artistic director. Participants in this festival included Arova, Borowska, Hayden, Lavallade, Novak, Danielian, Howard, Moncion, Sanders, Lotte Goslar, Carola Goya, Rebecca Harris, Mia Slavenska, Lois Smith, Ruth St. Denis, Emy St. Just, Sahomi Tachibana, David Adams, Merce Cunningham and Matteo. Shawn starred in *The Bajour*, choreographed by Myra Kinch.

New York performances were given by Marceau, Antonio, Carmen Amaya, Paul Draper, Katherine Dunham, Irene Hawthorne, the Azuma Kabuki dancers, Valerie Bettis, Hadassah, Letitia Jay, Geoffrey Holder, Lewis Johnson and the William Dollar company.

New Yorkers journeyed to the Brooklyn Academy of Music to

see the National Ballet of Canada, Dance Theatre Berlin, Alexandra Danilova, José Greco, May O'Donnell, Sybil Shearer, Pearl Lang, Talley Beatty, Darsonval and Kinch's company, with Shawn as guest artist.

Ballet played an important part in the Chicago Lyric theatre season, with Ruth Page as choreographer for Claudio Monteverdi's masque *Il Ballo delle ingrate* and the ballets *Revenge* and *The Merry Widow*. Dancers included Alicia Markova, Vera Zorina, Barbara Steele, Arova, Briansky, Bentley Stone and Kenneth Johnson. The Page ballets were later presented in New York, with a tour, starring Marjorie Tallchief and George Skibine, planned for late 1956. Page later choreographed *Rosina and the Barber* for her Chicago group.

Throughout the country, regional ballet companies were increasingly active. The University of Utah Ballet, directed by William Christensen, gave *The Nutcracker*. The Southern Ballet, headed by Karen Conrad and Pittman Corry, produced *The Dogwood Legend* and *Juliet of the Hills*. The Stone-Camryn Ballet, Chicago, presented Walter Camryn's *Trio* and Bentley Stone's *The Wall*. Crescent City Ballet (New Orleans), Cornish Ballet (Seattle), Tarot Dance Theatre (Milwaukee), Portland Ballet society (Portland, Ore.) and Richmond Civic Ballet (Richmond, Va.) were among the many groups reflecting widespread interest in the dance.

Danilova, Iva Kitchell, Miriam Marmein, Pearl Primus, Marina Svetlova, Teresa and Luisillo and the Robert Joffrey Theatre Dancers made extensive American tours.

Genevieve Oswald, curator of the dance collection of the New York Public library, received the Capezio award. The library held exhibitions on Pavlova and the Royal Danish Ballet.

England.—The event of the year was the first performance, Oct. 3, of the Bolshoi Theatre Ballet at Covent Garden Opera house. The Moscow company, headed by Galina Ulanova and Yuri Zhdanov, danced *Romeo and Juliet*, music by Sergei Prokofiev. Later *Giselle*, *Lac des cygnes* and *The Fountain of Bakhchisarai* were presented. Dancers included Raissa Struchkova, Nina Timofeyeva, Nina Chistova, Marina Kondratieva, Ludmilla Bogomolova, Rinna Karelskaya, Nadezhda Kapustina, Velta Vilcin, Alexei Yermolaev, Sergei Koren, Georgei Farman-yants, Yuri Gosman, Gleb Yevdokimov and Alexander Radunsky. By western standards the choreography appeared old-fashioned, but the dancing and acting were considered superb.

Sadler's Wells Ballet, directed by Ninette de Valois, celebrated its 25th anniversary with a gala performance at which Ashton's *Birthday Offering* was produced. The principal dancers participated: Margot Fonteyn, Beryl Grey, Violetta Elvin, Nadia Nerina, Svetlana Beriosova, Rowena Jackson, Elaine Fifield, Michael Somes, Philip Chatfield, David Blair, Alexander Grant, Bryan Ashbridge, Desmond Doyle, Brian Shaw. The company produced *Noctambules*, choreography by Kenneth Macmillan, music by Humphrey Searle, and *La Peri*, choreography by Ashton, music by Paul Dukas. *Entrée japonaise*, a solo arranged by Ashton for Fonteyn, had its London *première*. At the Edinburgh festival, the company presented *The Miraculous Mandarin*, choreography by Alfred Rodrigues, music by Bela Bartok. The Benesch system of dance notation was introduced at Sadler's Wells school.

Sadler's Wells Theatre Ballet, with John Field as its new resident director, toured extensively in the British provinces. The company produced *Somnambulism* and *Solitaire*, both choreographed by Macmillan, and *Saudades*, by Rodrigues.

Sadler's Wells Choreographic group presented experimental ballets.

London Festival Ballet, directed by Anton Dolin, had a long summer season at Festival hall. It presented *Les Deux errants*, choreography by Wolfgang Brunner, music by Bill Russo, and

Coppélia, staged by Harald Lander. Serge Grigoriev and Lubov Tchernicheva supervised the ballets of Michel Fokine. For the wedding of Prince Rainier of Monaco, the company produced *Homage to the Princess*, choreography by Michael Charnley, music by Stan Kenton. Dancers included Toni Lander, Belinda Wright, John Gilpin, Michael Hogan and, as guest artist, Flemming Flindt.

Marie Rambert received the Queen Elizabeth II Coronation award, presented by the Royal Academy of Dancing. Ballet Rambert toured Italy, England and Spain. Markova was guest artist during the Llangollen Eistedfodd in Wales.

Roland Petit's Ballets de Paris appeared in London. During Ballet Theatre's London season, Agnes de Mille danced *Rodeo*. Pilar Lopez presented *El Amor Brujo*, *Le Tricorne* and *Bolero*. A Pavlova memorial collection of dance books was established at the Westminster Central Reference library.

France.—Paris Opera Ballet produced *Concerto aux Etoiles*, choreography by Lander, music by Bartok, with Yvette Chauviré and Peter van Dijk in leading roles. Serge Lifar choreographed Prokofiev's *Romeo and Juliet*, with Michel Renault and Liane Daydé as protagonists. Claude Bessy was named *première danseuse étoile* and Jacqueline Rayet *première danseuse*.

The Stanislavsky Ballet of Moscow, directed by Vladimir Bourmeister, made its Paris debut. Ballets included *Lac des cygnes*, *Straussiana*, *Happy Shores* and *Merry Wives of Windsor*. Dancers, all trained at the Bolshoi Theatre Ballet school, included Eleanora Vlassova, Sophia Vinogradova, Alla Ossipenko, Yuri Kondratov, Alexis Tchitchinadze, Sviatislov Kouznetsov and U.S.-born Violetta Bovt. The June season was the first ever presented in western Europe by a full-scale Soviet ballet company. The Moscow State Folk Dance group, directed by Igor Moiseyev, also danced in Paris.

The Grand Ballet du Marquis de Cuevas toured Europe and produced ballets choreographed by Skibine, Leone Mail, Ana Ricarda and James Starbuck. Principal dancers were Marjorie Tallchief, Jacqueline Moreau, Genia Melikova, Serge Golovine, George Zoritch, Wladimir Skouratoff and Oleg Tupine.

Roland Petit's Ballets de Paris produced a jazz ballet, *Les Belles damnées*, and a murder ballet, *La Chambre*, with a story by Georges Simenon. Ballets Jean Babilée was organized, with Claire Sombert, Alexandre Kalioujny, Iovanka Biegovich and Dick Sanders. Walter Gore choreographed *The Seasons* for Les Ballets 1956, headed by Milorad Miskovitch.

Janine Charrat's company toured France and Switzerland and produced *High Voltage*, choreography by Maurice Bejart. Leonide Massine choreographed a Mozart *Divertimento* for the Enghien festival. Michele Seigneuret received the Prix René Blum. John Taras staged a ballet masque, *Fanfares pour le prince*, for the wedding of Prince Rainier of Monaco.

Australia.—For the Borovansky Ballet, David Lichine choreographed *Corrida*; Yurek Shabelevsky staged Massine's *Les Présages*. American dancers, Jacqueline Vollmar, Charles Dickson and Ron Murray, joined the company. Katherine Dunham toured Australia.

Austria.—The Vienna State Opera house, reconstructed since World War II, reopened. Erika Hanka and Gordon Hamilton directed the ballet. *Giselle* was presented, with Margaret Bauer and Erika Zlocha. Hanka choreographed *Othello*, music by Boris Blacher. Hamilton staged the *Don Quixote pas de deux*. Hanka's versions of Prokofiev's *Classical Symphony* and Christopher von Gluck's *Don Juan* were revived.

Belgium.—At the Théâtre de la Monnaie, Brussels, Jean Etcheverry choreographed *Candide* and *The Miraculous Mandarin*; Dolin staged *Giselle*. For the Royal Opera, Antwerp, Jacques Milliaud choreographed Igor Stravinsky's *Orpheus*.

Canada.—National Ballet of Canada, directed by Celia Franca,

produced *The Nutcracker* and added Tudor's *Dark Elegies*. Elizabeth Leese choreographed *The Lady From the Sea*.

Les Grands Ballets Canadiens was organized in Montreal by Ludmila Chiraeff. Stravinsky's *Les Noces* was produced. Montreal Theatre Ballet made its debut.

The Royal Winnipeg Ballet produced *The Devil in the Village*, choreography by Nenah Lhotka; *Parable*, choreography by Gweneth Lloyd; and *Clasico*, choreography by Paddy Stone. Ruthanna Boris and Frank Hobi were engaged to head the company; Boris' *Pasticcio* was produced.

Cuba.—Ballet Alicia Alonso produced Prokofiev's *Romeo and Juliet*, choreography by Alberto Alonso. Alicia Alonso staged *Narcissus and Echo*.

Denmark.—Frank Schaufuss was named ballet master of the Royal Danish Ballet, replacing N. B. Larsen, who became director of the Tivoli Pantomime Theatre but continued to dance in the Royal Danish Ballet. Jerome Robbins staged *Fanfare*; Dolin staged *Pas de quatre*; Bournonville's *Far From Denmark* was revived.

Germany.—At the Berlin City Opera (west zone), Tatiana Gsovsky staged *The Sleeping Beauty*. The Deutsche Staatsoper (east zone) presented *Gayne*. Gluck's *Don Juan* was given at the Komische Oper.

The Munich Opera presented *Giselle* and several ballets choreographed by Alan Carter; Peggy van Praagh staged De Valois's *The Rake's Progress*. In Hanover, Yvonne Georgi choreographed *Orpheus*, *Othello* and *The Nutcracker*. In Düsseldorf, Kurt Jooss produced Carl Orff's *Catulli Carmina*.

Iran.—William Dollar supervised the establishment of a government-sponsored ballet school in Tehran.

Israel.—Inbal, directed by Sara Levi-Tanai, produced *Yemenite Life* and *At the Gates of Zion*.

Italy.—Guest dancers and choreographers were featured in ballet performances at La Scala, Milan. Violette Verdy, Tamara Toumanova, Babilée, Vyroubova and Markova appeared in works staged by Massine, Rodrigues, Lifar, Charrat, Antonio and Ugo dell'Ara. Aurel Milloss choreographed ballets for the Florence festival.

Japan.—The Komaki Ballet produced *Nichirin*, *Petrouchka* and Tschaikovsky's *Fourth Symphony*. Arova and Job Sanders were guest artists in *The Sleeping Beauty*. Martha Graham toured Japan.

Mexico.—*El Mensajero del sol*, choreographed by Guillermina Penalosa, was presented in Mexico City. Ballet Concierto toured Mexico. Sokolow and Cunningham taught in Mexico City, at government invitation.

Netherlands.—The Netherlands Ballet presented *Giselle* and *Petrouchka*. Gore choreographed *Ginevra*; Van Dijk staged *Portrait d'un Maudit*. Ballet der Lage Landen presented *Paysage Triste*, choreography by Jack Carter. The Amsterdam Opera Ballet presented *Claire* and *Phèdre*, choreographed by Françoise Adret.

Norway.—The Norwegian Opera Ballet was organized in Oslo, with Robert Lunnun as ballet master. *Les Sylphides*, *Swan Lake* and *Pulcinella* were presented. Birgit Cullberg staged her *Medea*. Dancers included Grete Moller, Edith Roger and Jorunn Kirkenuer, with Fonteyn and Sones as guest artists.

South Africa.—Danilova and Franklin toured South Africa. Fonteyn and Sones danced at the Johannesburg festival. Merle Parke and Gary Burne toured Rhodesia.

South America.—At the Colón theatre, Buenos Aires, Tamara Grigorieva staged *La Valse* and *Concerto coreografico*; Michel Borowski choreographed *El Junco*.

At the Teatro Municipal, Rio de Janeiro, Massine choreographed *Hymn to Beauty*, music by Francisco Mignone, and staged *Le Tricorne* and *Gaité parisienne*. Igor Schwiezoff revived

Concerto Dancante.

In Santiago, Chile, Ernst Uthoff revived *Coppélia* and *The Green Table*; Patricio Bunster choreographed *Bastien and Bastienne*. Vadim Sulima's Classical Ballet company produced *Graduation Ball*.

In Guatemala, the Bellas Artes Ballet, directed by Denis Carey, produced *Peter and the Wolf*, *Sombreros y sueños* and Gluck's *Don Juan*.

In Lima, Peru, Dimitri Rostoff produced Fokine's *Paganini*. Nathalie Krassovska danced *The Firebird*. Roberto Ximenez, Manolo Vargas, Renate Schottelius and Toumanova toured South America.

Sweden.—For the Royal Swedish Opera, Stockholm, Mary Kreeping staged *Giselle*, with Elsa Marianne von Rosen, Gunnel Lindgren and Ellen Rasch. Massine staged and danced in *Le tricorne* and *Gaité parisienne*; Mariane Orlando appeared in his *Le sacre du printemps*. Guest artists included Struchkova, Konstantinov, Elvin and Svetlova.

Goteborg organized a ballet company, for which Massine staged *Le Beau Danube*.

Turkey.—The Turkish State Ballet, developed from the State Ballet school, founded in 1949, made its debut, with Molly Lake and Travis Kemp as directors.

U.S.S.R.—The repertory of the Kirov theatre, Leningrad, included *The Bronze Horseman*, danced by Nonna Yastrebova and Boris Bregvadze; *Giselle*, with Natalia Dudinskaya; and Fokine's *Chopiniana*.

At the Bolshoi theatre, Moscow, Olga Lepeshinskaya danced *Coppélia*, with Farmanyants; Maya Plisetskaya appeared in *Lautia*, choreographed by Vahktang Chabukiani. Ulanova danced frequently. The Filial theatre, Moscow, produced *Shurale*, choreography by Leonid Yacobson.

Yugoslavia.—In Split, Ana Roje prepared a production of *Giselle*. (LN. M.)

ENCYCLOPÆDIA BRITANNICA FILMS.—*Steps of the Ballet* (1950).

Ballroom Dancing.—The year 1956 brought two novelty ballroom dances into international prominence: the cha-cha and the rock 'n' roll.

The cha-cha, originally called cha-cha-cha, became top choice advanced Latin dancing not only in the Americas but wherever

SOVIET BALLET COMPANY in a performance of *Romeo and Juliet* on the opening night of their engagement at Covent Garden theatre, London, Eng., Oct. 3, 1956

Cuban music was known. The cha-cha stemmed from mambo, which was an offshoot of the more staid Cuban dances such as the rumba, dansant and son. Each change in the development of these Latin dances added syncopation, but despite the prevalence of swing styling, cha-cha was danced more by adults than by teenagers.

There were many new recordings of cha-cha, but the best known were by Cuban orchestras and were exported all over the world through popular demand. Among the favourites were "Poco Pelo," "Pedro Pablo," "Cha-Cha in Blue" and "Coco Seco."

Rock 'n' roll began its rise to popularity in the United States in 1955, and by 1956 had spread, internationally, among teenagers and young adults. It is a form of jitterbug plus jumps, and the enthusiasts prefer fast tempo. There was no doubt of the overwhelming effect of the music on both dancers and avid listeners. The *New York Times* gave a half-page account in September of a riot that took place in London, Eng., during a rock 'n' roll jam session; the *Manchester Guardian* reported similar excitement in Manchester, Eng., and other cities in England and Scotland.

In the United States, a singer named Elvis Presley rose meteorically through such rock 'n' roll recordings as "Don't Be Cruel," "I Want You, I Need You, I Love You" and "Hound Dog." Other top rock 'n' roll numbers were "Why Do Fools Fall in Love," "Rock Around the Clock" and "See You Later, Alligator" ("alligator" is a jive term for a rock 'n' roll dancer).

Among other dances, the fox trot continued to hold its international first place. The most popular rhythmic numbers were "Autumn Leaves" and "Poor People of Paris," danced in conventional style with little change in step patterns.

The waltz had a standard place in ballroom dancing. Two new compositions that were unusually popular in 1956 were "Allegheny Moon" and "Che Sera Sera," the latter adapted from an Italian folk song.

The merengue, which made such a strong start in 1955, declined in favour along with the samba, and the mambo was superseded by cha-cha. The tango had some revival in England and

the United States, probably because of the great popularity of a tango dance number called "Hernando's Hideaway" from the musical *The Pajama Game*.

Square dancing, with its intricate but standardized steps and "calls," held the interest of its devotees. In July 1956 dancers from 38 states, Canada and Great Britain attended the International Round and Square Dance festival in Missouri.

Deafness: see HEARING.

Deaths (of prominent persons in 1956): see OBITUARIES.

Death Statistics. The level of mortality in the United States remained low during 1956. The death rate in the first eight months was 9.4 per 1,000 population, slightly higher than for the like period of the previous year. During the whole of 1955 about 1,527,000 deaths were registered and the death rate was 9.3 per 1,000 population, excluding the armed forces overseas. This was only slightly above the record low of 9.2 reported in 1954.

For the United States, the death rates per 1,000 population of stated age in 1955 were: under one year, 29.6; ages 1-14 years, 0.7; ages 15-24 years, 1.2; ages 25-34 years, 1.5; ages 35-44 years, 3.1; ages 45-54 years, 7.5; ages 55-64 years, 17.4; ages 65-74 years, 39.4; ages 75-84 years, 89.1 and age 85 and over, 178.2. For all ages combined, both white males and females recorded small increases in their 1955 rates, as compared with 1954; on the other hand, nonwhite males and females showed decreases. The death rates per 1,000 population by race and sex for 1955 were: 10.7 for white males; 11.2 for nonwhite males; 7.8 for white females; and 8.7 for nonwhite females.

As in previous years, diseases of the heart was the leading cause of death during 1955 in the United States, accounting for 37.9% of all deaths. Malignant neoplasms (cancer and allied conditions) were second in importance, being responsible for 15.9% of the total mortality. The ranking of the ten leading causes of death is set forth in Table I. The causes associated with maternity accounted for only 1,950 deaths in the United States in 1955, the rate being 4.8 per 10,000 live births; this compares with a rate of 20.7 per 10,000 live births in 1945.

Table I.—Estimated Death Rates, Rank Order and Percentage of Total Deaths for the Ten Leading Causes of Death, United States, 1955

Rank	Cause	Death rate per 100,000 pop.	Percentage of total deaths
1	Diseases of heart	147.6	15.9
2	Malignant neoplasms, including neoplasms of lymphatic and haematopoietic tissues	106.6	11.5
3	Vascular lesions affecting central nervous system	55.6	6.0
4	Accidents	39.8	4.3
5	Certain diseases of early infancy	27.5	3.0
6	Influenza and pneumonia, except pneumonia of newborn	19.4	2.1
7	General arteriosclerosis	15.2	1.6
8	Diabetes mellitus	11.9	1.3
9	Congenital malformations	10.8	1.2
10	Cirrhosis of liver

The expectation of life at birth in the United States reached a new high of 69.6 in 1954. This established a gain of 22½ years since 1900. White females had an expectation of life at birth of 73.6 years in 1954, for white males it was 67.4 years, for nonwhite females 65.8 years and for nonwhite males 61.0 years.

Canada reported an increase of 3% in deaths during the first eight months of 1956, as compared with the same period of the year before. The number of deaths in Canada for the entire year

Source: United Nations, *Monthly Bulletin of Statistics* (Oct. 1956); Office of Population Research, Princeton University, and Population Association of America, *Population Index* (July 1956); Canada, Dominion Bureau of Statistics, *Preliminary Annual Report of Vital Statistics* (1955).

1955 was 128,154, and the death rate was given as 8.2 per 1,000 population. England and Wales recorded slightly fewer deaths in the first half of 1956 compared with the same period of 1955. During the entire year 1955, England and Wales had 518,865 deaths, with a death rate of 11.7 per 1,000 population; this was 3.5% above the rate for 1954. In Australia, the death rate for 1955 (excluding aborigines) was 8.9 per 1,000 population, or 2% below the rate for the previous year. New Zealand reported a death rate of 9.0 per 1,000 population of European origin in 1955 and 1954. Table II shows death rates for a number of countries in 1954 and 1955.

Debt, National. The national debt of the United States at the end of fiscal year 1956 amounted to \$272,751,000,000, about \$1,600,000,000 lower than a year earlier. (See Table I.) In its Aug. 28, 1956, report reviewing the 1956

Source: Data from 1915 to 1956 are from U.S. Department of the Treasury, *daily treasury statement* (revised); 1957 is estimate from "The 1957 Federal Budget and Year Review," Bureau of the Budget, Executive Office of the President, Aug. 28, 1956.

budget, the bureau of the budget estimated that the national debt would be further reduced to \$271,400,000,000 by June 30, 1957. The prospective decrease was attributed mainly to an anticipated budget surplus (estimated at \$707,000,000) in the fiscal year 1957.

The decline in public debt during fiscal 1956 was the first in five years. In the four fiscal years from 1952 through 1955, the public debt had expanded by more than \$19,000,000,000. The expansion followed a substantial reduction in public debt during the 1946-48 period and an irregular, moderate increase over the 1949-51 period. The national debt as of June 30, 1956, was about \$6,400,000,000 below the peak total of \$279,214,000,000 reached at the end of Feb. 1946.

In Aug. 1954 congress enacted legislation by which the stat-

tory debt limit of \$275,000,000,000, which had been in effect since mid-1946, was raised to \$281,000,000,000 until June 30, 1955. This legislation was extended for another year in June 1955. By an act of congress in July 1956, the statutory debt limit was set at \$278,000,000,000 for the fiscal year ending June 30, 1957.

The decrease in public debt during fiscal year 1956 stemmed primarily from a budget surplus of \$1,754,000,000 partly offset by an increase of \$331,000,000 in the treasury cash balance. The increases in national debt during 1952-55, in turn, had reflected mainly budget deficits.

As shown in Table II, the debt decrease in fiscal 1956 was concentrated in the nonmarketable category, with the principal change therein being the final redemption of treasury savings notes. Over the fiscal years 1952-55, marketable interest-bearing issues had increased by about \$17,300,000,000, absorbing more than nine-tenths of the net rise in total public debt. Such

issues accounted for 57% of the debt total as of June 30, 1956. Through fiscal 1951, the post-World War II debt retirement program of the treasury had involved a large reduction in marketable interest-bearing securities. From the debt peak in Feb. 1946, when they formed 71% of the total public debt, marketable obligations were reduced nearly \$62,000,000,000 by the end of June 1951. During the last ten months of 1946, the funds used to retire aggregate maturities of more than \$23,000,000,000 were obtained chiefly from the general fund cash balance accumulated in the Victory Loan drive. In the period Jan. 1947-June 1951, funds for reducing the marketable public debt were derived mainly from the growth in nonmarketable issues.

Of the public debt total of \$272,751,000,000 as of June 30, 1956, interest-bearing debt amounted to \$269,883,000,000 and matured debt and debt bearing no interest amounted to \$2,868,000,000. The interest-bearing debt consisted of \$224,769,000,000 in public issues and \$45,114,000,000 in special issues held by the various governmental funds and agencies. The publicly held debt, in turn, was comprised of \$154,953,000,000 in marketable obligations and \$69,817,000,000 in nonmarketable obligations. Table III shows the maturity distribution of interest-bearing, publicly held marketable securities for the years 1952-56. Particularly noteworthy is that the volume of securities becoming due or callable within one year rose almost \$14,000,000,000 in fiscal 1956. This marked a reversal of developments in the preceding two fiscal years, when securities maturing within one

year had been reduced by \$25,000,000,000. By the end of June 1956, the proportion that such securities formed of the marketable total amounted to 42%, as compared with 33% in the previous year and the postwar high of 52% registered on June 30, 1953.

In fiscal 1956 the banking system reduced its holdings of federal securities by \$6,400,000,000. (See Table IV.) Nonbank investors thus absorbed about \$5,000,000,000, as retirements amounted to about \$1,600,000,000.

The principal factor in the decline of bank holdings was the liquidation of government obligations by commercial banks. This was financed in part the heavy demand for loan accommodations on the part of businesses and persons.

The reduction in bank holdings of federal securities in fiscal 1956 may be viewed against the background of previous developments. As one of the measures adopted by treasury and federal reserve authorities to combat post-World War II inflation, a substantial reduction in bank ownership of federal securities was effected over the period from Feb. 1946 to June 1953. Securities held by the banking system declined from \$116,700,000,000 to \$83,600,000,000—or from 42% to 31% of total federal securities outstanding. During fiscal 1954 bank holdings of federal obligations expanded to \$88,700,000,000. They declined moderately in fiscal 1955 and then dropped to \$80,700,000,000, or 29½% of the total, in fiscal 1956.

Federal debt held by nonbank investors totalled \$192,200,000,000 at the end of June 1956, or \$5,000,000,000 more than a year earlier. Within this large category, insurance companies and mutual savings banks effected a further liquidation of federal obligations. The total holdings of individuals rose almost \$2,000,000,000 as higher-income investors purchased marketable bonds to take advantage of the relatively low prices and favourable yields offered by such securities. State and local govern-

ments, U.S. government investment accounts and miscellaneous investors continued to invest their accumulating pension and welfare reserves in federal bonds. Corporate holdings dipped \$1,000,000,000 as companies liquidated their holdings to pay income taxes and finance expansion programs.

During the fiscal year 1956, interest rates on both short-term and long-term federal securities continued to rise from the lows reached in June 1954. These advances reflected the heavy demand for borrowed funds on the part of businesses, persons and state and local governments during the entire fiscal year.

Short-term rates rose considerably faster than did long-term rates, and by June 1956 were about one-sixth above the previous peak of June 1953. Long-term rates, on the other hand, had not quite regained their postwar highs by mid-1956. These rates commenced to rise after the treasury-federal reserve "accord" of March 1951, when the federal reserve in its government security operations began placing greater emphasis on the supply and availability of bank reserves and less emphasis on maintaining fixed prices of federal obligations. After advancing by one-fourth from March 1951 to June 1953 and attaining the highest point

since the early 1930s, the average yield on long-term treasury bonds dropped sharply during fiscal 1954. Almost all of this decline was recovered in the subsequent advance through June 1956.

Interest payments by the federal government, consisting almost wholly of charges on the public debt, approximated \$6,-850,000,000 in fiscal 1956. This was about \$400,000,000 higher than payments in each of the two preceding fiscal years. In its Aug. 28, 1956, report on the 1957 budget, the bureau of the budget estimated that total interest payments by the federal government in fiscal year 1957 would amount to \$7,156,000,000. The anticipated increase over fiscal 1956 reflected higher interest rates.

U.S. State and Local Government Debt.—The latest official estimates available in 1956 of the aggregate debt of state

and local governments in the United States are shown in Table V. State and local debt amounted to \$43,200,000,000 at the end of June 1955, an increase of \$5,300,000,000 during the fiscal year. It was evident from available information on the volume of new offerings that the rise in such indebtedness continued into fiscal 1956.

These developments were an extension of past trend in the postwar period. After dropping from \$20,246,000,000 in 1940 to \$15,922,000,000 in 1946, the debt of state and local governments expanded steadily to the total of more than \$43,000,000,000 in 1955. In relative terms, the 1946-55 increase in indebtedness was much larger for state governments than for local governments.

Construction outlays occasioned a very large share of all borrowing by state and local governments in the 1946-55 period. In addition to projects that had been postponed from the pre-1946 period, such outlays stemmed from requirements created by the rapid postwar rise in street and highway traffic and in the school-age population.

Other Countries.—In Table VI are presented data on the national debts of many countries of the world. Insofar as permitted by available information, the data are shown for 1939 and for a late postwar year, affording a comparison of national debts before and after World War II.

(See also BUDGET, NATIONAL; TAXATION.)

Delaware. Delaware, on the middle Atlantic seaboard, one of the original 13 states of the United States, is called the "First state," having been the first to ratify the federal constitution, Dec. 7, 1787. The "Diamond state" is also a popular name. Area: 2,057 sq.mi. (land 1,978 sq.mi.; inland water 79 sq.mi.). Population: (July 1, 1956, provisional est.) 402,000; (1950 U.S. census) 318,085.

The principal city of Delaware is Wilmington (pop. 1950 census) 110,356. Other cities, with 1950 populations, are Dover (cap.) 6,223; Newark 6,731; New Castle 5,396; Elsmere 5,341; Milford 5,179.

History.—Outstanding legislation in 1956 by the held-over session of the 1955 general assembly was an increase of the school-building program to \$55,000,000; a program of substantial salary increases to teachers and all public school employees; authorization to the state highway department to build limited-access roads out of revenue (above interest and retirement obligations) from the Delaware Memorial bridge (congress was expected to amend the bridge charter accordingly); a bonus for all Korean war veterans.

During the first nine months of 1956 new construction of all types (except privately built homes) amounted to \$70,027,216 including industrial, \$21,000,050; commercial, \$4,058,142; institutional and public, \$25,362,024; group housing, \$19,027,216.

The chief state officers in 1956 were: governor, J. Caleb Boggs; lieutenant governor, John W. Rollins; secretary of state, John N. McDowell; tax commissioner, C. Douglass Buck; bank commissioner, Randolph Hughes; state treasurer, Howard H. Dickerson; auditor of accounts, Clifford E. Hall; chief justice, Clarence A. Southerland; chancellor, Collin J. Seitz; president judge, Charles S. Richards; attorney general, Joseph Donald Craven; adjutant general, Brig. Gen. Joseph J. Scannell; director, legislative reference bureau, Andrew Christie; director, state development department, Miles L. Frederick.

In the Nov. 1956 election 98,057 Delaware votes were cast for Pres. Dwight D. Eisenhower against 79,421 for Adlai Stevenson. A high proportion of registered voters, 94%, went to the polls.

Delaware's one congressman, Harris B. McDowell, Jr., Democrat, was defeated for re-election by Harry G. Haskell, Republican. State offices filled at the election were: governor, J. Caleb Boggs (Rep.), re-elected; lieutenant governor, David P. Buckson (Rep.); treasurer, Mrs. Vera G. Davis (Rep.); auditor of accounts, Dale E. Wheatly (Rep.).

Education.—The state appropriation for operation of the public schools in the 1956-57 fiscal year was \$20,240,478. Elementary schools had an enrolment of 39,183 and a teaching staff of 1,484. Secondary schools had an enrolment of 24,753 and teaching staff of 1,203. For the fiscal year ending June 30, 1956, the state board of vocational education placed 480 disabled persons in earning jobs. The state superintendent of public instruction was George R. Miller, Jr.

Social Insurance and Assistance, Public Welfare and Related Programs.—State unemployment compensation paid for the fiscal year ending June 30, 1956, was \$1,875,673. Active claims on Oct. 13, 1956, were 4,000. The cost of general assistance for the fiscal year ending June 30, 1956, was \$688,152 for an average of 1,048 cases per month. On Oct. 1, 1956, 1,601 persons were receiving old-age pensions.

During the same fiscal year a monthly average of 1,149 children were cared for in their own or foster homes at a cost of \$322,730. The number of dependent children aided averaged 1,153 per month at a cost of \$157,045.

State appropriations for public welfare in 1956 amounted to nearly \$5,000,000, including support of the state health centre and the state welfare home, care of the mentally ill and mentally retarded, crippled children, industrial schools and homes for the aged.

The state board of corrections in the fiscal year ending June 30, 1956, received at the New Castle County institution 3,203 prisoners and discharged 3,091. The total number of prisoners in the three county institutions on June 13, 1956, was 719.

Communications.—The mileage of all highways and rural roads was 3,983. The income of the state highway department for the fiscal year was \$13,009,226, including federal aid of \$2,486,186. Railroad mileage was approximately 350. During the year ending May 31, 1956, 8,463,935 vehicles crossed the Delaware Memorial bridge; revenue, \$7,229,769.55.

For the year ending Oct. 1, 1956, tonnage at the port of Wilmington was 740,656, value of cargoes \$48,029,797. On Oct. 1, 1956, the state had 107,354 main telephones in use.

Banking and Finance.—On June 30, 1956, there were 60 state banks and trust companies, including branch banks and offices, having total resources of \$622,322,309. Assets of 8 national banks were \$33,213,805. Demand deposits of state banks and trust companies increased by \$17,153,690, savings deposits by \$5,478,334 during the fiscal year. Savings deposits in the 10 mutual savings banks increased by \$6,338,651.

Total state receipts for the year ending June 30, 1956, were \$101,161,605, of which \$50,071,700 was from taxes and \$51,089,905 from special funds. The cash balance at the beginning of the year was \$6,653,212. Expenditures were \$89,814,282. The gross debt was \$84,491,000 and total debt service (interest and redemptions) amounted to \$5,799,798.

Agriculture.—Cash income from agricultural production in the first seven months of 1956 was \$60,574,000, of which \$42,958,000 was from livestock and \$17,616,000 from crops. The total cash income for 1955 was \$101,066,000, of which \$76,448,000 was from livestock, \$24,728,000 from crops, and \$186,000 from government payments.

Manufacturing.—Gross receipts of 783 licensed manufacturers for the year ending June 30, 1956, were \$637,156,192, compared with 816 for the previous year with gross receipts of \$698,450,745. The average number of employees under the unemployment compensation law for the year ending March 31, 1956, was 123,000. Total wages paid for the year ending June 30, 1956, were \$553,191,908. The Wilmington area quarterly survey of employment Aug. 15, 1956, showed 77,044 employed by 559 employers compared with 72,403 by 557 employers on the same day in 1955. New corporations chartered at Dover for the year ending June 30, 1956 were 616 compared with 3,692 the previous year. Corporations that became paid were 1,109 compared with 1,065 the year before. (J. EN.)

Mineral Production.—Delaware has the smallest mineral output of any of the states, and that almost entirely in building materials as given in

Table III.—Mineral Production of Delaware

	(In short tons)			
	Quantity	Value	Quantity	Value
Total		\$659,000		\$1,024,000
Sand and gravel	520,817	399,685	971,647	752,528
Stone	80,364	215,382	?	*
Other minerals	43,930	...	271,263

*Value included with other minerals.
Source: U.S. Bureau of Mines.

Table III, which shows only those minerals valued at \$100,000 or more. However, Delaware was first in titanium output in 1954. The value of the minerals produced in the state was 0.01% of the U.S. total.

ENCYCLOPEDIA BRITANNICA FILMS.—Northeastern States (1955).

Democracy. The most remarkable event in the development of democracy in 1956 was the progressive extension of democratic principles to Asia and Africa. In western Europe and in North America the democratic process had struck such deep roots that after having successfully withstood the pressure of fascism and communism in the 1930s and in the 1940s, its validity was nowhere doubted.

Democracy in Europe, 1956.—Parliamentary elections were held in Europe in 1956 in Austria, Sweden, Netherlands and France. In Austria, the 11-year-old coalition of the Catholic Conservative party and of the Social Democrats continued, indicating a stable development of this strategically located country. In France, however, the elections to the national assembly held at the beginning of the year did not strengthen French democracy. The Communist party gained heavily in number of deputies on the one end of the political picture and on the other end a new neo-fascist party under the leadership of Pierre Poujade succeeded in filling 51 seats. Nevertheless, the French were able to establish a relatively stable middle-of-the-road government under a right wing socialist premier, who had to cope with the difficult problems of monetary inflation in France and nationalist unrest in French North Africa.

The revelations regarding Stalin's terror and misdeeds, which Nikita Khrushchev, the secretary general of the Soviet Communist party, discussed in a closed session before the 20th Communist party congress in Moscow in Feb. 1956, were an indirect help to democracy in Europe. Under their impact, some of the communist leaders and parties in western Europe were confused and shaken. Negotiations started in Italy for a fusion of anti-communist democratic socialists under the leadership of Giuseppe Saragat and the powerful left-wing socialists under Pietro Nenni, who so far had been faithful allies of the communists. Such a fusion would greatly strengthen the democratic cause in Italy, though some observers expressed doubts about the validity of the conversion of Nenni to democracy. But even more important were the repercussions of the new developments in the Communist party in some of the satellite countries in eastern Europe, especially in Poland. The Polish press and intellectuals started to discuss openly the need for greater liberty in Polish life. The Polish workers in Poznan went on strike and in bloody demonstrations on June 28 demanded not only bread and a living wage but political liberties and free elections. How far the democratization of the Italian socialist movement and the liberalization of the Polish regime would go was not yet clear; yet the year had witnessed the first hopeful beginning in the break of the communist grip on the labour movement and the social life in the two countries.

Democracy in Africa.—Two African territories which had been French protectorates, Morocco and Tunisia, achieved their independence in 1956. The former territory was hardly prepared for a democratic development, but the situation in Tunisia was much more promising. There, as a result of national elections, Habib Bourguiba established on April 10, 1956, the first democratic government in the history of Tunisia. Following the example of Turkey, the Tunisian government abolished polygamy

Table I.—Leading Agricultural Products of Delaware

and changed the divorce laws in favour of the wives and their security after the western model. Literate women above 21 years of age received also the right to vote. The religious Islamic courts were abolished and replaced by secular courts. Thus Tunisia became, after Turkey, the first Mohammedan country to try to adopt traditional life to western democratic concepts and to protect the dignity of women, without, however, diminishing the respect for the precepts and position of the Mohammedan religion.

Even more far reaching were the democratic measures envisaged in the two British African colonies of Gold Coast and Nigeria; both of them looked forward to the rapid achievement of independence and the introduction of western parliamentary governments under British guidance in the immediate future. Even France, which so far had been strictly opposed to any form of real autonomy for its African colonies, slowly started to follow the British example of democratic reforms. A law of June 23, 1956, enabled the French government to establish in the African territories, territorial assemblies with the right to legislate in certain limited fields and to give the native populations some share in the exercise of executive power.

Independent Ethiopia also took its first step toward democracy. At the end of 1955 Emperor Haile Selassie granted his country a new constitution. It introduced for the first time in the history of this ancient nation the right to vote and provided for a lower house of parliament elected by universal suffrage. Following the British model of the 19th century, the constitution adopted the system of gradualness, to allow democracy to take real root in the popular mind. A codification of modern laws was being undertaken and the first elections were to be held within two years.

Democracy in Asia, 1956.—In Asia democracy had deep roots only in the Philippines and in the member states of the British commonwealth—India, Pakistan and Ceylon. Even in Turkey democracy was weakened in 1956 by an attempt of the ruling Democratic party to curtail the liberty of the press and the activities of the opposition parties. Elections in Burma showed the growing influence of the communists, especially among the students; as a result U Nu, the prime minister and leader of the Anti-Fascist People's Freedom league, withdrew from political life, deeply disappointed in the communist agitation. Elections held in Ceylon in April 1956 resulted in the defeat of the United National party which had been in power for 25 years and was strongly pro-western, by the People's United Front, whose leader, Solomon West Ridgway Diaz Bandaranaike, a wealthy Oxford-trained political leader, had shown neutralist inclinations. In Indonesia the elections at the end of 1955 resulted in the formation of a coalition government, from which the Communist party, although the third strongest among the four major parties, was excluded.

Democratic Party: see POLITICAL PARTIES, U.S.

Denmark. A democratic monarchy of north central Europe, Denmark has an area of 16,577 sq.mi. Greenland (q.v.), an island of 840,000 sq.mi. in the North Atlantic ocean, is an integral part of the kingdom. Pop.: (1950 census) 4,281,275; (1954 est.) 4,387,967. Capital: Copenhagen (with chief suburbs, 1954 est.) 1,202,891. Other principal cities (1954 est.): Aarhus 118,888; Odense 104,344; Aalborg 81,954. Religion: Lutheran Christian. Ruler in 1956: King Frederick IX. Prime

minister: H. C. Hansen.

History.—A government commission established in Dec. 1955 produced a revealing report on the country's economic problems. Despite emphasis on full employment, increased investment and the checking of inflation, none of these goals had been achieved. Progress made during the early months of 1955 had come to a halt. In the years 1950–55 Denmark's total production had increased only 9%, compared with increases of 16% in England and Sweden, 17% in Norway, 21% in the Netherlands, 32% in Italy and 60% in west Germany. An unfortunate relationship between the costs of imports and the prices obtained for Danish agricultural exports was part of the trouble. Denmark blamed the United States for "dumping" butter in west Germany, ruining Denmark's market there and depressing butter prices elsewhere. Of more general significance was the uncontrolled spending in Denmark for both building and consumption goods.

Unrest expressed itself in the outbreak of a series of strikes in March 1956. First 30,000 metal workers walked out, then 4,000 seamen; the resultant lack of fuel and electric power seriously hampered production and communication. Then the printing trades struck, with total strikers numbering about 60,000–70,000. Employers threatened, but did not carry out, a lockout of about 200,000 employees. The official conciliator worked out a proposal for wage increases of 1½ cents per hour and various fringe benefits; the workers rejected this solution, and went back to work in mid-April only after the parliament passed legislation compelling them to do so. The seamen did not yield until April 27 and were forced to pay a fine of 1,000,000 kr. for their intransigence; Communist-inspired riots occurred in a few places.

Early in March a number of Danish officials visited Moscow, but as Prime Minister Hansen said on his return, "We have not sold one another our points of view." Progress was made in an agreement to co-ordinate rescue work in the Baltic and to facilitate indemnity claims concerned with the former Baltic republics. "Cultural co-operation" was pledged, and Russian archives were opened to Danish historians. A Russian request for a tanker was parried with the offer of two freighters.

Denmark was much interested in research in the peaceful uses of atomic energy, and was granted \$200,000 by the Ford foundation for the promotion of such activity, primarily conducted through the institute headed by Niels Bohr.

In the field of Scandinavian co-operation, Denmark continued to press for action. The Nordic council met in Copenhagen in January, with the common Scandinavian market as one of the chief topics. Agreement was reached that about 45% of inter-Scandinavian trade was to be duty free, but 65%–70% was necessary if Denmark-Norway-Sweden was to qualify as a free trade area under G.A.T.T. (General Agreement on Tariffs and Trade).

The promoters of the riots of 1955 in Klaksvig in the Faeroe Islands were sentenced: harbour master Fischer-Heinesen and vice-chairman Joensen of the Klaksvig municipal council to six-months imprisonment and 31 others to lesser terms.

A unique clock was set in motion by King Frederick in the Copenhagen city hall on Dec. 15, 1955. Through 30 years watchmaker Jens Olsen had worked on the design, and when he died others carried through the construction in another 10 years. It was expected to deviate only two-fifths of a second in 300 years and to run without stopping for at least 1,000 years. In 11 connected works and on 10 dials the "world clock" showed, among other things, the days, weeks, months and years of both Julian and Gregorian calendars, and the movements of the planets and of sunrise and sunset.

In May the defense ministry was left vacant by the resignation of Rasmus Hansen, and Premier H. C. Hansen appointed

POLISH JET FIGHTER which landed on an uncompleted airstrip on Bornholm island, Denmark, Sept. 25, 1956, the third incident of its kind since 1953. The pilot was seeking political asylum in the west

Poul Hansen in his place.

(F. D. S.)

Education.—Schools (Dec. 1954): primary, middle and secondary 3,960, pupils 635,610 (of which 108,260 secondary), teachers 22,793; folk high, agricultural and domestic science schools (1954-55) 117, pupils 11,064; technical (1952) 581, pupils 96,407; teacher training schools (excluding domestic science, physical training and primary rural) 25, students 4,492. Institutions of higher education (1954) 10, of which 2 universities with 1,343 students.

Finance and Banking.—Monetary unit: krone, with an exchange rate of 4.907 to the U.S. dollar. Budget: (1953-54 actual) revenue 4,268,400,000 Kr., expenditure 5,143,600,000 Kr.; (1955-56 est.) revenue 4,895,800,000 Kr., expenditure 4,906,700,000 Kr. Internal debt (March 1954): 8,012,000,000 Kr.; external debt 1,566,800,000 Kr. Currency circulation: (Jan. 1955) 1,982,000,000 Kr.; (Jan. 1956) 1,984,000,000 Kr. Deposit money: (Jan. 1955) 5,171,000,000 Kr.; (Jan. 1956) 5,208,000,000 Kr. Gold and foreign exchange: (March 1955) 160,100,000 U.S. dollars; (March 1956) 188,000,000 U.S. dollars.

Foreign Trade.—(1955) Imports 8,142,000,000 Kr., exports 7,290,000,000 Kr. Main sources of imports: U.K. 25%; Germany 19%; other continental E.P.U. (European Payments Union countries) 34%; Latin America 2%; U.S. and Canada 8%. Main destinations of exports: U.K. 33%; Germany 18%; other continental E.P.U. 25%; U.S. and Canada 4%; Latin America 6%. Chief exports: bacon 16%; butter 12%.

Transport and Communications.—Roads (Jan. 1955): 57,490 km. Motor vehicles in use: passenger (1954) 193,300, commercial (Dec. 1954) 95,600. State railways (1954) 2,651 km.; private 2,039 km.; passenger-kilometres (1954) 3,313,154,000; freight, ton-kilometres (1954) 1,164,000,000. Shipping (July 1955): merchant vessels of 100 gross tons and over, 680; total tonnage 1,651,686. Air transport (1955): passenger-kilometres 296,580,000; freight, ton-kilometres 8,160,000. Telephones (Jan. 1955): 864,980. Licensed radio sets (1953) 1,320,000.

Agriculture.—Main crops (metric tons, 1955; 1954 in parentheses): wheat 248,000 (292,000); barley 2,197,000 (2,045,000); oats 870,000 (799,000); rye 194,000 (277,000); potatoes 1,442,000 (1,963,000); sugar beets 1,932,000 (1,694,000). Livestock (Sept. 1955): cattle 3,178,000; sheep 32,000; horses 308,000; pigs (April 1956) 4,587,000. Food production (metric tons, 1955): milk 5,136,000; butter 165,000; cheese 87,600; beef and veal 212,400; pork 512,400. Fish landings (1954) 352,500 metric tons (excluding Faroe Islands, 89,400 metric tons).

Industry.—Fuel and power (1955): lignite 804,000 metric tons; manufactured gas 90,000,000 cu.m.; electricity (excluding industrial generation) 3,396,000,000 kw.hr. Production (metric tons, 1954): superphosphates 454,689; glass containers 37,776; pig iron 39,551; cement (1955) 132,800. Index of production (1949=100): (January-March 1955) 124, (January-March 1956) 117. Merchant vessels launched (100 gross tons and over, 1955) 153,600 gross tons.

ENCYCLOPEDIA BRITANNICA FILMS.—Denmark (1955); Scandinavia—Norway, Sweden and Denmark (1950).

Dentistry. The effectiveness and safety of fluoridation in reducing tooth decay evolved conclusively from theory to scientific fact in 1956. Early in the year, the final reports of the ten-year field trials in Grand Rapids, Mich., Newburgh, N.Y., and Brantford, Ont., showed approximately a 60% reduction in tooth decay in children living in all three cities. The same results were reported after eight and a half years of fluoridation field trials in Evanston, Ill.

During 1956, the second and seventh largest cities of the U.S., Chicago, Ill., and Cleveland, O., initiated fluoridation programs.

As of Oct. 1, 1956, there were about 1,300 communities in 45 states with a total population of about 29,000,000 persons drinking fluoridated water. In addition, more than 3,000,000 persons were drinking water which naturally contained fluoride of 1.0 parts per 1,000,000 or more.

Interest in fluoridation also continued abroad. In addition to Canada, where a number of cities were employing it, fluoridation was reported to be in operation in at least one city in Brazil, Chile, Colombia, west Germany, Malaya, Netherlands, Japan, Sweden, United Kingdom, Belgium, Australia and New Zealand.

Expanded dental research programs were established as a result of a congressional appropriation of \$6,026,000 for the dental activities of the U.S. public health service. The major portion was earmarked for the activities of the National Institute of Dental Research, including nearly \$4,000,000 for research grants to schools and other nongovernmental agencies, fellowships and training grants. Congress also appropriated funds for the expansion and construction of research facilities in schools of dentistry and medicine.

Development of a panoramic X-ray machine, designed for use in mass surveys and examinations, was completed during the year. The machine, which rapidly takes a single X-ray picture of the entire dental arch, was developed by the national bureau of standards in co-operation with the U.S. air force. It was expected that the new technique would save much of the time required to take and process conventional X-rays, where up to 14 separate films were necessary to complete a full mouth survey.

In the new technique, the film is placed outside the patient's mouth and is exposed by passing a narrow beam of X-rays through the patient's head from the rear. An exposure time of 20 sec. is needed for each side of the arch. A complete panoramic X-ray of all the teeth is obtained on a single 5 x 10-in. film in 40 sec. While conventional X-rays fail to show pathological conditions lying outside the field covered by the small film, the single picture X-ray presents a comprehensive picture of the entire mouth. The panoramic X-ray machine records adequate detail to obtain a diagnosis of general mouth conditions; however, it is not designed to supplant the conventional X-ray machine in cases where extreme sharpness and detail are needed.

The establishment of a permanent dental health section in the World Health organization (WHO) was an indication of the trend toward increased interest in international dental activities. The WHO dental program, which covers more than 100 nations throughout the world, included a four-point plan for prevention, education, treatment and research.

The Fédération Dentaire Internationale, the recognized international organization for the dental profession, also continued to expand its activities. Representatives of the dental societies of 20 countries were present at the federation's May meeting in Zurich, Switz. One of the important resolutions passed at the 1956 session urged all member nations to take steps to combat extensive dentifrice advertising campaigns in operation throughout the world. The resolution pointed out that the advertising was based on "unsupported claims for the prevention of dental disease" and warned that the promotion of these dentifrices tended to mislead the public by minimizing the importance of accepted dental health practices. (H. T. DN.)

Dermatology. By 1956, a new significance was being attached to the importance of a positive "Wassermann" test. A person was formerly thought to be infected with syphilis if his blood test was positive. During World War II evidence increased that such positive tests did not necessarily indicate the presence of syphilis, for many men in service had so-called "false positive" tests especially after being vaccinated for smallpox. Usually, these blood tests gave positive reactions for only a short period and became negative in time. More recently it had become apparent that there are both temporary and permanent false positive reactions. It was believed now that the presence of a chronic or permanent false positive blood test carries serious import, for it was noted that such a test might well be the first sign of a serious disease, particularly systemic lupus erythematosus. New tests were devised to determine, if possible, whether a positive reaction is due to syphilis or not. The *Treponema pallidum* Immobilization test which, when positive, indicates rather reliably the presence of syphilis, is both technically difficult and expensive to perform. In 1956 a newer test, the *Treponema pallidum* Complement Fixation test, was reported to be equally reliable, and it could be performed by any laboratory that performed the standard type tests.

Oxypsoalens are a group of drugs capable, in some cases, of repigmenting areas of skin from which pigment has been lost, as in the disease vitiligo. Recently it was reported that these drugs act also to reduce all activities of the sun's rays, thus in effect tending to prevent sunburn. In addition, the drugs potentiate tanning of the skin. For the latter reasons they were exploited as sun-tan pills, to be taken by mouth.

Itching has long been considered a form of pain. Now the suggestion was made that itching may be a primary sensation distinct from either pain or touch. There were indications that itching might be engendered by chemical stimuli from proteolytic enzymes in the skin, and different enzymes it appears, have different latent periods, different durations and even different intensities. Under experimental conditions, certain enzymes actually produced itching sensations but not pain. The precise mechanism of the action was still unknown but it was postulated that certain circumstances perhaps produced a synthesis or release of an active proteinase from cells in the skin. If verified, these results might well open an entirely new field of research to develop effective anti-itch remedies.

Sarcoidosis, a peculiar disease without a common name, long thought to be limited to the skin, is now recognized as a systemic

disease capable of affecting almost any structure of the body. The condition is not common or rare, it affects American Negroes more than whites, and usually runs a prolonged benign course—though malignant forms are encountered. The cause is not known. Many physicians consider it to be a form of tuberculosis; others have noted a resemblance to leprosy; and some consider it to be a disease "sui generis."

Recently an interesting epidemiological study of sarcoidosis in 350 U.S. servicemen in World War II revealed a significantly greater frequency among those born in the southeastern states, those residing in rural areas, and those residing in regions where there is fine sandy soil, like that in which hookworm is most prevalent. It was suggested that some organisms may find certain soils in the southeastern United States a natural medium, and that plant and animal life in the areas might be worth studying for possible causative relationship to sarcoidosis.

During the year tranquilizing drugs were much used for patients with skin diseases thought to be linked with emotional disturbances and those producing an uncontrollable urge to scratch. More often than not, the effects of the drugs were satisfactory, though inevitably some untoward cutaneous reactions from their use were reported.

There were reports also of untoward reactions from the use of saccharin (urticaria); from "wet strength" tissue papers; from self medications with vitamin A for acne (a young woman was reported as becoming bald and suffered from bone and joint pains, insomnia, swollen ankles, haemorrhages in the skin, aphthous lesions and frequency of urination); and peculiar granulomatous lesions that developed in the armpits from the use of certain type stick antiperspirants.

Detroit. Detroit, Mich., seat of Wayne county, had an estimated 1956 population of more than 2,000,000 as compared with a 1950 federal census count of 1,849,568. Surrounding suburbs comprising the metropolitan area and lying in parts of four counties had a population approximately equal to that of the city proper.

As it was in several immediately preceding years, the trend in Detroit in 1956 was toward municipal rehabilitation. Its system of limited-access expressways continued to be extended. The Henry and Edsel Ford Memorial auditorium was completed and construction of the Convention and Exhibits building begun. The latter would accommodate the largest conventions. Both were elements in the river front development which had brought about the razing of many blocks of old structures.

Large-scale municipal parking facilities in the form of multi-deck garages, underground garages and surfaced lots were started, and in some instances completed, both downtown and in outlying shopping districts. Like the expressways, the parking program was required by the great extent to which Detroit is dependent upon private automobiles. With a land area of 139.6 sq. mi. its sole public transportation consists of city-owned bus lines.

Work was begun on a private housing development where blocks of slum hovels had been levelled, and a pilot rehabilitation program was carried on in a large section given mainly to older housing.

Preliminaries toward meeting berthing needs of larger and more numerous ocean-going vessels anticipated upon completion of the St. Lawrence seaway were undertaken, with policy calling for public facilities in addition to expansion of present private

hip terminals.

Planners also gave attention to the problem of "industrial tumors." Detroit is so completely surrounded by other incorporated communities that further annexations are all but impossible, and within the city limits virtually all land is occupied. With many of its factory structures growing obsolete, there has become apparent a need for industrial plant replacement which can be met only by clearing ground for it in present industrial areas of the city.

Detroit's government is nonpartisan and its officials are elected for four-year terms. The nine-member common council is elected at large. Its own courts for trial of criminal cases relieve the pocket of the state courts.

The school system is partly on the so-called 8-4 plan (elementary and high school) and partly 6-3-3 (elementary, intermediate and high). During 1956 the municipal university, Wayne, with an enrolment of about 17,000, was transferred to the state of Michigan as its third university. In terms of administration and financing the transfer would be conducted over a three-year period.

Detroit's 1956-57 fiscal assessed valuation was \$4,901,491,790; bonded debt \$310,620,703 and its municipal tax rate per \$1,000 of assessed valuation \$22.393; its school tax rate \$13.864.

(R. Ho.)

Diabetes. The blood sugar lowering effect of a sulfonamide was noted by Ruiz in 1930 in rabbits and in 1942 by Janbon in a case of typhoid fever. A. L. Loubatières and others of the French school found that, with oral or intravenous use of p-aminobenzolsulfonamid isopropyl thiodiazol (2254 IP) in animals, the sugar in the blood was lowered, but it was ineffective in the totally depancreatized animal. Subsequently in Germany while studying the antibacterial activity of BZ 55 (carbutamide-pan-aminobenzene-sulfonamide butyl urea) it was observed that certain patients would develop a lowering of the blood sugar and symptoms of an insulin reaction. Therefore, BZ 55 was given on a large scale by F. Bertram in his clinic, and his conclusions were substantiated to a remarkable degree. This drug in general acts best with diabetics over 45 years of age in whom the disease is of less than five to ten years' duration, who have not been treated at all or only for a part of the time with insulin and in whom it is considered probable that some of the beta cells of the islands of Langerhans are still producing insulin. In children and juveniles BZ 55 rarely is effective; in these cases it works presumably only when the disease is in an early stage with a remission. It seldom acts if the patients excrete more than 40 g. of sugar in 24 hours or require more than 30 units of insulin. Under all conditions, diet is fundamental for a successful treatment with BZ 55.

BZ 55 (carbutamide) was originally produced in Germany by Hoechring and Sons, but another drug in which the amino group is replaced by the methyl group in the benzene ring, thus eliminating an antibacterial effect, was manufactured by Farberwerk-Boechst. This is known as D860, tolbutamide or Orinase. These drugs were said to have been used by 70,000 patients in Germany. Contraindications for the use of BZ 55 and Orinase are known sensitivity to sulfonamides, infections, the presence of ketonidosis, surgery and pregnancy. They also should be avoided when complications in the liver or kidneys are suspected or when the patient is in an unstable condition so that the interpretation of results would be difficult.

Fewer complications were reported in Germany than in some other countries, where they had reached 10%. The commonest complications were skin rashes, occasionally accompanied by fever, headaches and rarely jaundice.

In 1956 these drugs were still in the experimental stage unlike

insulin. Presumably they act on the insulin-producing cells of the pancreas.

Prior to the discovery of insulin, diabetics lived on the average 6 years after onset of the disease, but in 1956 the span was 18 years. The enormity of the problem can be realized when it is considered that there were at least 2,000,000 diabetics in the U.S. in 1956. Those with onset under age 40 lived 25 years; those with onset between ages 40 and 59 lived 19 years; and those with onset at age 60 or more lived only 10 years. Up to 1914 the percentage of diabetics living more than 20 years was 1.8, but in 1956 it was 42. Of 1,072 diabetics the onset of whose disease took place in childhood and the duration of which had been 20 years or more, 82% were living, 16% had died and 2% were untraced. Of the 169 deaths, diabetic coma claimed 0.6%, infections 2.9%, tuberculosis 1.2% and cardiorenal-vascular disease 87.5%; of the last, 50.9% of deaths were attributed to disease of the kidneys.

The importance of sex in diabetes had become more and more evident because of greater interest in and investigation of the health of females and also because of the greater numbers who lived into the age zone when diabetes was most likely to have its onset. In 1948 in the United States the excess of diabetic females over males amounted to 70%. Female diabetics decidedly predominated in the age group from 45 years onward. Recently, D. A. Pyke added another cause. He found that the excess of women diabetics was confined to women who had borne children, and that it rose with increasing parity. In an analysis of 953 diabetics there was an approximately equal sex incidence below the age of 45, but a preponderance of women over 45. A woman who had borne five children appeared to have about three times as great a chance of developing diabetes as a woman who had borne none; on the other hand, parity did not lead to the earlier appearance of diabetes. Pyke found that this effect of parity could not be attributed merely to a slightly greater tendency of multiparae to become fat, since the preponderance of women diabetics were of normal weight or underweight. Likewise, he excluded the menopause as an aetiological factor because an excess of women diabetics would be expected in all parity groups and this was not the case. The age at diagnosis was similar for all degrees of parity.

The availability of a simple method of determining the percentage of sugar in the blood was of major importance in the discovery of insulin. The introduction of two paper tests, Tes-Tape and Clinistix, for the detection of sugar in the urine was of much less importance, but these tests were so simple that they stimulated patients to keep far better control of their disease. The Tes-Tape and Clinistix tests depended upon paper impregnated with glucose oxidase and O-tolidine and a second enzyme, a vegetable peroxidase which produces oxygen when in contact with beta glucose. Tes-Tape incorporates a dye which reacts by a colour change from blue to yellow in a partly quantitative way, while Clinistix depends upon orthocolidine which if oxidized is a deep blue. This enzyme system was more sensitive than methods formerly generally employed and was a specific for glucose.

Confusion sometimes occurred in the minds of patients and even doctors in the interpretation of the tests, because the colour changes showing the presence or absence of sugar were exactly opposite to those dependent upon Benedict solution. These tests were, however, harbingers of what the biochemists would some time provide as a ready method for the determination of sugar in the blood.

Diamonds. World production of diamonds increased 5.5% in 1955 over 1954. Table I, based on a U.S. bureau of mines compilation, gives the details of the industry. Thus output in all principal diamond producing areas, except South Africa, increased in 1955. The decrease there resulted from the closing of two of the mines of the De Beers group of Kimberley and curtailment of output at three others. The proportion of industrial stones in the total caratage was over 83%.

*Revised. †Preliminary.

The diamond sales syndicate reported sales in 1955 as £74,288,695 (gem stones £50,253,946; industrials £24,034,749) compared with £62,153,125 in 1954, an increase of 19%.

United States.—In 1955, the dollar value of diamond imports rose from \$170,201,321 in 1954 to \$217,184,643. The U.S. imports of industrials in 1955 were equal to 85% of the world output.

The syndicate reported that sales in the first nine months of 1956, in dollar values, totalled \$153,600,000 (gems, \$103,000,000; industrials, \$50,600,000). It also reported that diamond sales had been bolstered by the U.S. government defense

FOUR-HUNDRED TWENTY-SIX CARAT DIAMOND purchased by a New York city dealer in Jan. 1956. Cutting the stone into a single gem would give it an estimated value of \$2,500,000 but would pose the problem of finding a buyer wealthy enough to purchase the jewel

stockpiling, and when this ceased new outlets would have to be found. (F. E. H.; B. B. M.)

Disasters. The loss of life and property in disasters during the period Nov. 1, 1955, to Oct. 31, 1956, include the following. (See also articles on ACCIDENTS; FIRES AND FIRE LOSSES; FLOODS AND FLOOD CONTROL; METEOROLOGY; SEISMOLOGY.)

Aviation

- Nov. 1 Near Longmont, Colo. Commercial air liner crashed following time-bomb explosion, killing 44 persons.
- Nov. 8 Near Taegu, Kor. South Korean training plane struck school; 1 children and a student pilot were killed, 12 children injured.
- Nov. 17 Near Las Vegas, Nev. Crash of U.S. air force plane killed 1 persons.
- Nov. 18 Near Seattle, Wash. Commercial air liner crash killed 28 of 70 persons aboard.
- Nov. 20 Iwo Jima, Bonin Is. U.S. air force plane crashed during take-off; 10 of 11 persons aboard were killed.
- Nov. 29 Fairbanks, Alsk. U.S. air force plane crashed in residential area; 14 persons were killed, 8 injured.
- Dec. 21 Jacksonville, Fla. Commercial air liner crash killed 17 persons.
- Jan. 18 Near Torsky, Levoca, Czech. Air liner crashed in Tatra mountains; 22 persons were killed, 4 injured.
- Feb. 17 Near Niles, Calif. U.S. marine corps air transport struck mountain peak; 40 persons were killed.
- Feb. 18 Near Valletta, Malta. Scottish air liner crashed, killing 5 persons.
- Feb. 20 Near Cairo, Eg. French air liner crashed in desert; 52 of 60 persons aboard perished.
- Feb. 24 Near Aleppo, Syr. Syrian air liner exploded in mid-air; 19 persons were killed.
- Feb. 27 Dayton, O. U.S. air force plane crash and explosion killed 1 persons.
- March 3 North Atlantic ocean. U.S. air force plane with 17 persons crashed about 250 mi. from Iceland; there were no survivors.
- March 12 Placenta bay. U.S. air force plane crashed and exploded a short distance south of Newfoundland; all 6 persons aboard were killed.
- March 31 Near Nakhon Ratchasima, Thai. Thai air force plane crashed killed 19 persons.
- April 1 Near Pittsburgh, Pa. Air liner crashed and burned; 22 persons were killed, 14 injured.
- April 2 Puget sound. Air liner crashed and sank near Seattle, Wash.; 38 persons aboard were killed.
- May 15 Orleans, Que., Can. Canadian air force jet plane crashed into Roman Catholic rest home; 15 persons, including two crew members, were killed; the home was totally destroyed by fire.
- May 15 Katmandu, Nep. Indian air liner crashed into canyon killing a 21 persons aboard.
- May 15 Jeffersonville, Ind. Eight persons died when private plane crashed.
- May 24 Izabal province, Guat. Guatemalan air liner crashed into mountain peak, killing 30 of 31 persons aboard.
- June 9 Minneapolis, Minn. U.S. navy jet plane crashed and burned housing area; the pilot and 8 other persons were killed, 5 injured.
- June 20 Atlantic ocean. Venezuelan air liner crashed in flames off Asbury Park, N. J.; all 74 persons aboard perished.
- June 24 Near Kano, Nig. Thirty-two of 45 persons aboard British air liner died in crash following take-off.
- June 30 Northern Arizona. Two commercial air liners collided in flight over the Grand Canyon during a storm; all 128 persons aboard planes were killed. It was termed the worst commercial air disaster in aviation history.
- July 13 Near Fort Dix, N.J. U.S. air force transport plane crashed in rain; 46 of 66 persons aboard were killed, 20 injured.
- July 16 Near Rio Cuarto, Arg. All 18 persons aboard died in crash of Argentine air liner.
- Aug. 22 East China sea. U.S. navy patrol bomber with 16 persons aboard was admittedly shot down by Red Chinese guns about 160 mi. north of Formosa and about 35 mi. off the China coast; there were no survivors.
- Aug. 29 Cold Bay, Alsk. Crash of Canadian air liner killed 15 of 20 persons aboard.
- Aug. 31 Near Anchorage, Alsk. Crash of U.S. air force weather plane killed all 11 persons aboard.
- Sept. 10 Sea of Japan. U.S. air force weather plane lost in typhoon near Niigata, Jap.; all 16 persons aboard were presumed dead.
- Sept. 24 Near Buena Vista, Colo. U.S. air force plane crashed into mountain, killing all 12 persons aboard.
- Oct. 11 Atlantic ocean. U.S. air force plane with 59 persons aboard, a military personnel, disappeared on flight between Lakenheath Eng., and the Azores.

Fires and Explosions

- Nov. 1 Near Akahira, Hokkaido, Jap. In mine explosion, 60 coal miners were killed, 6 injured.
- Nov. 9 Near Fukouka, Jap. Explosion in coal mine killed 11 persons, injured 18.
- Dec. 1 Piacenza, It. In explosion of World War II bombs 9 persons were killed.
- Dec. 7 Frankfurt-on-Main, Ger. Gas explosion in apartment building killed 27 persons and injured 7.
- Jan. 9 Near Amos, Que. Fire in home killed 8 members of one family.
- Jan. 29 Baltimore, Md. Fire in hall terrified crowd; 11 persons were killed, 227 injured in crush.
- Feb. 13 Gerze, Tur. Fire in office building killed 20 persons.
- March 2 Motize, Moz. Explosion in coal mine killed 34 persons.
- March 7 Joban City, Jap. Gas explosion in mine killed 14 persons, injured 7.
- March 8 Oxford, Pa. Fire in home killed 11 persons, all members of same family.
- April 4 New York, N.Y. Collapse of burning factory killed 6 firemen, injured 8.
- April 15 Prachuab Khiri Khan, Thai. Bomb accidentally dropped from Thai air force plane killed 30 persons, injured 29.
- April 26 Near Sylvania, O. Seven children, all members of one family, died when house burned.
- April 27 Pulaski, Va. Gas heater in 3-story building exploded, killing 10 persons.
- May 17 Near Takoradi, Gold Coast. Explosion in ammunition dump killed a reported 25 soldiers.
- July 2 Madrid, Sp. A reported 15 persons were killed and more than 40 injured when apartment building collapsed after a fire.
- July 15 New York, N.Y. Conflagration of 25-hr. duration in abandoned Wanamaker store building injured 208 firemen.
- July 29 Near Dumas, Tex. Explosion and burning of 4 oil tanks killed 19 persons, injured 32.
- July 30 Puxico, Mo. Fire in nursing home killed 12 persons.
- Aug. 7 Cali, Col. Seven military trucks laden with dynamite and gasoline exploded in midcity; a reported 1,200 persons were killed, more than 2,000 injured; 8 city blocks were destroyed and property damage was set at more than \$40,000,000.
- Aug. 8 Marcincelle, Belg. Fire in coal mine killed 262 persons. It was termed the worst mining disaster in Belgium history.
- Aug. 13 Monticello, Utah. Explosion, caused by leakage of natural gas in restaurant, killed a reported 15 persons, injured 9.
- Aug. 27 Koenigshuette, Pol. Fire and escaping gas killed a reported 29 coal miners.
- Sept. 3 Johannesburg, U. of S.Af. Dynamite explosion in gold mine killed 11 persons.
- Oct. 8 Near Middelburg, U. of S.Af. Gas explosion in coal mine killed 11 persons.
- Oct. 18 Herrin, Ill. Explosion of propane gas killed 8 persons, injured 4 others.

Marine

- Nov. 6 Off Fiji Islands. Launch, apparently struck by ship, found drifting in South seas; 25 persons were missing and presumed dead.
- Nov. 11 Pacific ocean. U.S. navy bomber crashed into destroyer "U.S.S. Hopewell" off Southern California coast killing 5 sailors, injuring 5 others.
- Dec. 31 Near Nandabi, Ken. Launch capsized in Lake Victoria during storm; 24 persons perished.
- Jan. 12 Samchonpo, S. Kor. Estimated 71 persons perished when ship "Taishin-Ho" burned at dock.
- Jan. 18 Lake Charles, La. Oil tanker exploded and burned in Calcasieu river; 4 persons were killed, 8 injured and 14 missing and presumed dead.
- Feb. 12 Near Mansoura, Eg. Ferryboat capsized in Nile river; 22 persons were killed.
- March 1 Near Alesund, Nor. Fishing boat capsized; 19 of 20 persons aboard were killed.
- March 16 Off Bajo Rapel, Chile. Fishing boat with 16 persons aboard foundered; 2 persons were killed, 14 missing and presumed dead.
- April 7 Badagri, Nig. Motor launch sank outside harbour, killing 28 persons.
- April 8 Parris Island, S.C. During military manoeuvres in swamp, 6 U.S. marines drowned.
- April 20 Off Shikoku Island, Jap. Ferryboat capsized; 16 persons were killed.
- May 13 Java sea. Overloaded launch capsized off Tegal, Java; 73 persons drowned.
- May 30 Rio de Janeiro, Braz. Ship and barge collided killing 10 persons.
- June 2 Bay of Bengal. Coastal steamer capsized between Chittagong, E. Pak., and Sandwip Island during monsoon; a reported 199 of 206 persons aboard were drowned.
- July 12 Chenab river, Pak. Boat sank about 80 mi. N.W. of Lahore; 95 persons were reportedly drowned.
- July 25 Atlantic ocean. Two trans-Atlantic liners, the Italian "Andrea Doria" and the Swedish "Stockholm," collided about 60 mi. south of Nantucket, Mass. The "Andrea Doria" sank but the "Stockholm" made port under her own power. Of 1,709 persons aboard both ships 50 were killed.
- July 28 Near Kuopio, Fin. Bus rolled off ferryboat and sank; 15 persons were drowned.
- Aug. 22 Near Baghazar, India. Ferryboat capsized in flooded Ganges river; 14 persons perished.
- Sept. 15 Near Lofoten Islands, Nor. U.S. freighter "Pelagia" sank in storm off Bodo, Nor.; 32 of 37 persons aboard died.
- Oct. 4 Off Ijmuiden, Neth. Polish fishing boat "Cyranka" sank; 10 trapped persons died.
- Oct. 31 Off Ishinomaki, Jap. Fishing boat "Hyohei Maru" capsized during storm; 38 of 45 crew members perished.

Miscellaneous

- Nov. 5 Paris, Fr. Faulty stove flues, supposedly clogged by heavy fog, asphyxiated a reported 15 persons.
- Nov. 17 Istanbul, Tur. Apartment house collapse killed a reported 15 persons.
- Dec. 25 Tampico, Mex. Panic in theatre caused deaths of 13 persons.
- Jan. 1 Niigata, Jap. Wall collapsed at shrine during New Year's festivities; 124 persons were killed.
- Feb. 13 Rio de Janeiro, Braz. Two-day pre-Lenten festivities left 13 persons dead, 437 injured.
- Feb. 19 La Paz, Bol. During Lenten season activities 31 persons fell into a sewer and were killed.
- Feb. 22 Kosti, Sudan. Imprisoned in a small jail, 194 farmers were suffocated and 8 injured.
- March 17 Kafr Saqr, Eg. Balcony in theatre collapsed; 12 persons were killed, 50 injured.
- March 23 Rawalpindi, Pak. Crowd en route to celebrate Pakistan's Republic day stampeded on bridge; 35 persons were killed, more than 60 injured.
- April 21 Granada, Sp. Falling of cavern roof killed 20 persons.
- June 8 Madrid, Sp. Floor collapsed during wedding dance; 17 persons were killed, 30 injured.
- June 12 Brooklyn, N.Y. Six children were killed when sand bank in which they were playing caved in.
- Aug. 6 Genova, Col. Ferris wheel collapsed killing 6 persons, injuring 30.
- Oct. 22 Karachi, Pak. A reported 48 workers were killed, 28 injured when concrete girder fell on them.

Natural

- Nov. 30 Mindanao-Visayan area, Phil. A reported 93 persons died in rainstorms.
- Dec. 2 Madras, India. Rainstorm and resultant 3-day floods, killed a reported 120 persons.
- Dec. 18 Tripoli area, Leb. Floods killed a reported 140 persons; 300 were missing and presumed dead.
- Dec. 27 Northern California-Oregon area. Nine-day rains and resulting floods killed a reported 74 persons, and caused property damage estimated at more than \$150,000,000. Hardest hit was Yuba City (Calif.) area.
- Jan. 10 Florida. Storm and low temperatures caused more than \$10,000,000 damage to crops.
- Feb. 4 Texas. Snowstorm swept entire state and killed a reported 18 persons.
- Feb. 9 Toyama, Jap. Avalanche killed 40 persons.
- Feb. 25 Illinois, Missouri, Indiana. Tornado killed 6 persons in Illinois, injured many others and caused property damage estimated at more than \$3,000,000.
- Feb. 26 Europe. Four-week intense cold wave, which swept over entire continent, killed a reported 907 persons and caused crop damage estimated at more than \$2,000,000,000.
- March 2 Near Seoul, Kor. Snow avalanche engulfed South Korean army barracks; 79 persons were killed, 36 injured and 24 missing.
- March 2 Santos, Braz. Cloudburst and resultant landslide killed 30 persons.
- March 16 Southern Lebanon. Series of earthquakes killed 145 persons, injured more than 200.
- March 20 Northeastern U.S. Four-day snowstorm extending northward from West Virginia to Maine killed a reported 162 persons and caused property damage of more than \$150,000,000.
- March 25 Santos, Braz. Heavy rains followed by landslide caused deaths of 36 persons.
- April 2-3 Midwestern-Southern U.S. Tornadoes killed 45 persons, injured 375 and caused property damage in 13 states estimated at more than \$15,000,000.
- April 11 Nampula-Niassa districts, Port. E.Af. Cyclone killed 107 persons.
- April 15 Near Birmingham, Ala. Tornado killed 22 persons, injured more than 800.
- May 12 Michigan-Ohio. Heavy wind, rainstorms and tornadoes killed 10 persons, injured more than 135; hardest hit was Cleveland, O., area.
- June 10-17 Kabul, Afg. A reported 2,000 casualties, 100 reported dead in week-long period of earthquakes.
- July 6 Central Philippine Islands. Tropical storm killed a reported 39 persons; 11 others missing and presumed dead.
- July 9 Thera, Gr. Earthquake, tidal wave and volcanic eruption killed 48 persons, injured 92.
- July 21 Kutch area, India. Earthquake killed 113 persons, injured 219; city of Anjar devastated.
- July 23-24 Kashan and Isfahan area, Iran. Floods killed a reported 450 persons and caused property damage estimated at \$60,000,000.
- July 26 Kandahar area, Afg. Floods caused by heavy rains killed a reported 51 persons.
- Aug. 2 Hangchow, China. Hurricane killed a reported 83 persons, injured 300.
- Aug. 4-5 Southwestern Pennsylvania. Floods following violent rainstorms killed 15 persons.
- Aug. 1-7 Chekiang, Hopeh and Honan provinces, China. Floods following typhoon "Wanda" caused deaths of a reported 2,161 persons, injured thousands more.
- Aug. 17-18 Northern Japan and Okinawa. Typhoon "Babs" killed 30 persons, left 16 others missing, injured 168.
- Aug. 22 West Pakistan. Flood in villages resulted in deaths of at least 70 persons, with hundreds missing.
- Aug. 22-23 Adjejan province, Tur. Flash floods caused by heavy rains killed 138 persons.
- Sept. 10 Okinawa, Japan, S. Korea and Philippine Is. Typhoon "Emma" killed a reported 55 persons and caused property damage estimated at more than \$2,000,000.

Above: SERIOUSLY INJURED passengers being comforted by relatives and other persons after interurban train overturned in Los Angeles, Calif., on Jan. 22, 1956

Above, left: WEARY SURVIVORS of collision between the passenger ships "Andrea Doria" and "Stockholm" on July 25, 1956. Below is the "Andrea Doria," listing to starboard shortly before sinking about 60 mi. from Nantucket, Mass., at 10:15 a.m., July 26

DISASTERS

Left: CHARRED GROUND in lower part of photograph marks remains of one of two airliners that collided in flight over the Grand Canyon in Arizona on June 30, 1956

Below: BELGIAN SOLDIERS, called to emergency duty, waiting for bodies to be carried up from coal mine disaster at Marcinelle. Short-circuited cable started fire 3,000 ft. below surface Aug. 8, 1956

Natural—Continued

- Sept. 17 Nemours, Alg. Cyclone killed at least 21 persons, injured 40.
 Sept. 26—Okinawa-Japan area. Typhoon "Harriet" killed a reported 23 persons.
 Sept. 27 Near Anasol, India. Flood in coal mine killed 28 workers.
 Sept. 30 Darbhanga, N. Bihar, India. Flash floods along Gandak river the previous week killed a reported 100 persons.
 Oct. 11 Near Manizales, Col. Twenty truck drivers died when landslides buried trucks.
 Oct. 14 Near New Delhi, India. Floods on Jumna river caused deaths of a reported 50 persons and property damage estimated at more than \$30,000,000.
 Oct. 20 Near Bampa, Garhwal, India. Avalanches killed 27 persons.
 Oct. 30 Honshu, Jap. Rainstorms caused deaths of 44 persons.

Railway

- Nov. 20 Near Didcot, Eng. Derailment of train killed 10 persons, injured 99.
 Dec. 2 Barnes, Eng. Commuter train struck stopped freight train; 13 persons were killed, 50 injured.
 Jan. 13 Near Kopparberg, Swed. Collision of rail bus and ore train killed 20 persons.
 Jan. 22 Los Angeles, Calif. Passenger train overturned after jumping track; 30 persons were killed, estimated 150 injured.
 Feb. 14 Near Santiago, Chile. Two trains collided; 21 persons were killed, 114 injured.
 Feb. 23 Near Odenton, Md. Broken axle caused train to jump track; 6 persons were killed, more than 100 injured.
 Feb. 25 Bornitz, E. Ger. Collision of two trains killed 32 persons, injured 40.
 Feb. 28 Near Swampscott, Mass. Train crashed into rear of another stopped at station; 13 persons were killed, 100 injured.
 Mar. 1 Near Ixaca, Mex. Train wreck caused deaths of 15 persons, injured 61.
 Sept. 2 Near Mahbubnagar, Hyderabad, India. At least 121 persons were killed when bridge collapsed and caused train section to drop into flooded stream.
 Sept. 5 Springer, N.M. Switching error by worker caused collision of 2 trains; 20 persons were killed, 10 injured.
 Oct. 15 Near Tsu, Jap. Collision of two trains caused deaths of 36 persons, injured 36.

Traffic

- Dec. 23—U.S. Deaths in auto accidents over 4-day Christmas weekend totalled 609 persons; a record.
 Dec. 26 United States. Traffic death toll over 3-day New Year weekend numbered 364 persons.
 Jan. 2 Near La Paz, Bol. Workers' truck crashed on mountain road killing 19 persons, injuring 14.
 Jan. 4 Near Karachi, Pak. Thirty-one of 51 persons aboard drowned when bus was swept away by rain-swollen river.
 Jan. 5 U.S. Deaths attributed to traffic mishaps over 30-hr. Independence day period totalled 137 persons.
 Aug. 5 Near Silay, Philippine Is. Collision of two buses killed 20 persons, injured 27.
 Sept. 4 U.S. Traffic deaths over Labor day weekend, as reported by the *Associated Press*, numbered 435 persons.
 Oct. 4 Near Virden, Man., Can. Head-on collision of two automobiles killed 10 persons, injured one.
 Oct. 25 Sigourney, Ia. Train-auto collision killed 8 car passengers, injured one.

Disciples of Christ.

Total membership of the Disciples of Christ in the United States and Canada in 1956 was 1,921,000; the world membership was 2,050,000; net increase in membership for the year was 30,321; local congregations in the world numbered 8,940; in the United States and Canada, 8,059. The total world number of ministers was 6,680. In the United States, Missouri had the largest number of local congregations and Indiana the largest membership. Total contributions for the United States and Canada were \$80,400,000. Missionary and benevolent giving exceeded \$25,000,000. Unified Promotion, the central receiving agency for missionary funds, raised \$4,238,156.21 during 1956. This represented a gain of 97.31% during the past five years. The 1956 Assembly of the International Convention of Disciples of Christ was held in Des Moines, Ia., Sept. 28-Oct. 3. The registration of 9,641 was the largest in history. The theme of this convention was "Spokesmen for God," highlighting the Year of the Ministry," which was the 1956 annual emphasis of the long-range program now in effect among Disciples of Christ. The program recognized the shortage of qualified ministers, and special effort was being made to recruit, educate and sustain the local ministry. Actions taken at the Des Moines assembly included a revision

of the pension plan to provide more liberal benefits to its members; establishment of new congregations, with special attention to the needs in New York city; emphasis on the urgency of interracial membership in local congregations; encouragement of continuance of fraternal visits between churchmen of the United States and the U.S.S.R.; an appeal for the extension of the refugee program; urging of more stringent laws for adoption of homeless children; and authorization of negotiations with other religious bodies in the formation of the United Church.

Missionary work during the year was conducted in 11 fields outside the United States: South Africa, Argentina, India, Jamaica, Japan, Mexico, Paraguay, the Philippines, Puerto Rico, Thailand and the Belgian Congo; 235 missionaries and 2,019 national leaders were serving under the United Christian Missionary society. Baptisms in overseas missions numbered 6,462. The membership of mission churches was 111,663, with a net gain in membership of 1,690.

The pension fund of Disciples of Christ reported a total active membership of 4,660 with 1,203 beneficiaries. This fund had total assets of \$21,166,186.07.

The National Benevolent Association of the Christian Church was in process of reorganization. There were 15 benevolent homes served by this organization, with an annual budget of \$1,500,000.

The Disciples of Christ are active members of the World Council of Churches and the National Council of the Churches of Christ in the U.S.A. Christian unity is their major objective.

The 1957 Assembly of the International Convention of Christian Churches (Disciples of Christ) was to be held in Cleveland, O., Oct. 11-16.

Dominican Republic. The eastern two-thirds of the island of Hispaniola is occupied by the Dominican Republic. Area: 18,682 sq.mi.; pop.: (1950 census) 2,135,872, (1956 est.) 2,463,000. The western one-third of the island comprises the republic of Haiti. The capital of the Dominican Republic is Ciudad Trujillo (known from the beginning of the 16th until the second quarter of the 20th century as Santo Domingo, whence the name of the nation); it has a population in excess of 200,000 (1953 est.). The 1950 census gave the largest cities as follows: Barahona 14,654; Ciudad Trujillo 181,553; La Romana 14,074; La Vega 14,200; Puerto Plata 14,843; San Francisco de Macoris 16,083; San Pedro de Macoris 19,876; and Santiago 56,558. The president in 1956 was Gen. Hector B. Trujillo y Molina.

History.—International relations were not seriously disturbed by some minor controversies with Cuba. The disappearance of a Spanish republican refugee named J. Galindez from his usual circle of activity in New York city, on the eve of the publication of a book adverse to the controlling regime in the Dominican Republic, where Galindez had once lived while working for that government, was the occasion of a campaign of charges in the United States against President Trujillo and his brother, the former president, Gen. Rafael Trujillo.

The international fair early in 1956, which cost the government more than \$30,000,000, was a substantial success, not only promoting a tourist influx, but bringing about also some stimulation of imports of manufactured goods. The establishment of a free zone was proposed as a proper use of the grounds and

buildings of the fair, and was under consideration late in the year. The value of exports, however, dropped in 1956, as in the preceding year, but there were slight increases in the volume of sugar, cacao and coffee sold abroad. Prices of consumers' goods changed very little in 1956. Budget receipts in 1956 were expected to exceed \$122,000,000, and expenditures to amount to \$120,000,000; but as the year progressed it became evident that outgo would exceed \$130,000,000, and income might attain that figure.

The investment of capital in the development of mineral resources proceeded rapidly during 1956. The mechanization of the gypsum mines promised an increase in the exportation of this product in 1957. The bauxite mines of the Aluminum company began operation at the end of 1956. The shipyard known as Astilleros Dominicanos Gibbs was pushed to completion, and was expected to receive its first repair jobs early in 1957.

European immigration continued at the same rate as in 1955; approximately 6,000 settlers (chiefly from Spain) entered the country during the two years. (C. E. Mc.)

Education.—In 1954 there were 2,641 schools (including 1,250 emergency schools), all of which were maintained by the state except 112 semiofficial (state-aided) and 169 private schools. The total number of pupils enrolled was 246,734. There were also 3,568 centres for combating illiteracy with 78,709 students enrolled. The University of Santo Domingo had 2,560 students. According to the 1950 census, 56.7% of those 10 years of age and over were illiterate.

Finance.—The monetary unit is the peso, officially pegged at par with the U.S. dollar. The 1956 budget estimated revenue at \$122,729,500 and expenditure at \$119,972,890. Revenue in 1955 was \$129,680,682. There was no public debt. Currency in circulation (June 30, 1956) totalled \$40,370,000; demand deposits, \$39,000,000. The U.S. department of commerce estimated U.S. direct private investments in 1955 at \$134,000,000. The cost-of-living index (Ciudad Trujillo) stood at 99 in June 1956 (1953=100). The gross national product at market prices in 1955 totalled \$527,700,000.

Trade and Communications.—Exports in 1955 totalled \$114,849,773; imports were \$99,278,688. Leading exports were sugar (36%), coffee (25%), cacao (15%), chocolate (6%) and tobacco (4%). Leading customers were the U.S. (53%), the United Kingdom (21%), the Netherlands (5%), Belgium (3%) and Puerto Rico (3%); leading suppliers, the U.S. (66%), the Netherlands Antilles (6%), Germany (4%), Canada (4%) and the U.K. (3%).

In 1951 there were 152 mi. of public railway, all owned and operated by the government, and 748 mi. of industrial railway, operated mainly by the sugar companies. Road mileage in 1950 was placed at 1,966, of which 694 mi. were classified as first-class all-weather, 1,027 secondary and 245 third-class. On Jan. 1, 1955, there were 11,308 motor vehicles, including 5,794 automobiles, 5,034 trucks and 480 buses. Telephones (Jan. 1, 1955) numbered 8,900, of which 85.6% were automatic.

Agriculture.—In the 1955-56 season 662,000 metric tons of sugar were produced; in 1955, 574,500 tons were exported. Production of other important crops in 1955-56 (preliminary) included coffee 595,000 bags of 132 lb. each (exports 1955: 408,000 bags); cacao 60,186,000 lb.; rice 220,000,000 lb.; tobacco (1955) 45,532,000 lb. In 1953 there were 857,000 cattle, 888,000 pigs, 125,000 horses and 121,000 mules and asses.

Manufactures.—In 1954 there were 3,416 industrial establishments with capital of \$166,567,172, 66,299 employees and sales amounting to \$162,516,994. Important products included sugar, cotton textiles, cement, beer, edible oils and chocolate. Installed electric energy capacity (Dec. 31, 1955) was estimated at 60,000 kw. (J. W. Mw.)

Donations and Bequests. Philanthropy in the United States apparently reached a record high in dollar volume in 1956. While official statistics of giving, recorded in both individual and corporate income tax returns, were not available beyond 1953, preliminary estimates indicated that total giving in the United States in 1956 considerably exceeded \$6,000,000,000. For 1953, the internal revenue service reports showed contributions by business and individuals estimated at \$5,275,000,000.

A record of benefactions of \$100,000 and over, announced in ten large urban areas (New York, N.Y.; Baltimore, Md.; Boston, Mass.; Chicago, Ill.; Houston, Tex.; Los Angeles, Calif.; Philadelphia, Pa.; Pittsburgh, Pa.; St. Louis, Mo.; and Washington, D.C.), during the first six months of 1956 totalled \$443,242,746 for 269 such gifts. The two largest recipients were colleges and universities, \$242,845,574, and hospitals and health agencies, \$129,551,025.

Corporate income tax returns for 1953 showed deductions for philanthropic giving totalled \$494,517,000, an increase of \$96,-

000,000 over 1952. According to the American Association of Fund-Raising Counsel, 1955 corporate giving totalled an estimated \$528,460,000. With the increasing number of business firms setting up programs for charitable contributions, the 1956 estimate exceeded \$625,000,000.

Estimates for religious giving which, for the most part, is by individuals exceeded \$3,000,000,000 for 1956.

The greatest increase in dollar volume of giving in 1956 apparently was in the foundation field, where estimates of grants and appropriations ranged from \$750,000,000 to \$950,000,000. The Ford foundation, on three appropriations made in 1955, totalling \$560,000,000 to the nation's privately supported universities, medical schools and hospitals, paid out in 1956 more than \$246,000,000.

According to a study of giving to 50 leading colleges and universities, 15 returning the 1955-56 questionnaire reported that total giving was running 38% ahead of 1954-55, not including first payments on the Ford foundation endowment and accomplishment grants. If Ford foundation grants were included, giving to those 15 institutions was more than 50% ahead of the 1954-55 fiscal year.

Drug Administration, U.S. The 50th anniversary of the federal drug control, which began with the Food and Drugs act of 1906, was celebrated throughout 1956, focusing attention on past achievements and future needs. Rewritten and strengthened in 1938 as the Federal Food, Drug and Cosmetic act, it is enforced by the Food and Drug administration (FDA), a unit of the department of health, education and welfare.

All aspects of the medical program relate to safety. Purity, quality, identity and labelling, including therapeutic claims, are required to measure up to safety requirements.

Research in medicine and pharmacology led to the development of many new drugs which the 1938 act required to be tested for safety, with supporting evidence evaluated by the Food and Drug administration. Applications for 520 new drugs were submitted during the fiscal year 1956, including 438 for human use and 82 for veterinary use. In the same period, 407 were allowed to become effective, 346 for human use. Many supplementary applications were received and 2,492 went into effect, half for veterinary preparations.

Some of the drugs considered during the year were tranquillizing agents, some nonbarbiturate hypnotics and sedatives, two general anaesthetics administered by intravenous injection, an antibiotic useful in staphylococcal and protein infections resistant to other agents, and others.

The pilot study initiated in 1955 for reporting adverse effects of drugs on some patients was expanded to include 11 leading hospitals, in collaboration with national medical and hospital groups. The preliminary study indicated that safety tests in the laboratory or conducted on limited groups were not sufficient. Results from a larger group would be more effective for evaluating any risks involved.

Growing awareness and concern over the hazards connected with careless storage of many household products resulted in a campaign in co-operation with other public health groups. While 12 caustic poisons were required to bear a poison label, many other products in common household use, such as some silver

polishes, cleaners, detergents, insecticides and drugs, can also be poisonous. A leaflet warning against accidental poisonings was issued by the FDA and given wide distribution. An advisory ruling was issued recommending that manufacturers label aspirin and other salicylates with warnings to keep them out of the reach of small children, and the drug industry responded commendably.

Congress made a special appropriation to the FDA to maintain surveillance over national distribution of the Salk polio vaccine in 1955 when the supply was short. From Aug. 1955 to June 1956, inspections were made of manufacturers, wholesalers and retailers to audit distribution records. No major abnormalities developed. As the supply increased, it appeared that the special program would not be required for the 1957 fiscal year and that surveillance could be maintained as part of normal drug operations.

Twenty drug recalls were supervised during the year, for deviations from the labelled potency, contamination of injectables and an eye medicine, corrections in dosage directions and expiration dates, dangerous pressure in bottles after shipment and toxicity to experimental animals.

Illegal sales of drugs continued to account for the majority of drug prosecutions. Cases were filed against 114 drugstores, pharmacists, lunch counter and tavern operators and employees, filling station operators and peddlers. Twenty-two of the actions, involving 42 defendants, were developed from complaints that truck drivers were using illegally obtained "stay awake" pills and were jeopardizing highway safety.

False and misleading claims were the causes of other actions. A public warning was issued with regard to a cancer clinic which had been enjoined previously from shipment of misbranded drugs. Two brothers were fined and placed on probation for the mail-order distribution of an inert glandular product, misrepresented as to origin and misbranded with sex rejuvenation claims.

The manufacturer and distributor who continued shipments of "orgone energy" devices after an injunction were prosecuted for criminal contempt, sentenced to jail and fined. The distributor of a misbranded ulcer remedy, who had contested a seizure and continued the misbranding after the case was decided in favour of the government, was fined and the responsible officers placed on probation.

Among the 51 medicines seized for false and misleading claims were articles composed of dried alfalfa, cereal grass, apple derivatives, buckwheat flowers, powdered pumice, phosphates, sulphates, papaya, royal jelly or an irrational mixture of one or more of these with vitamins and minerals. Among these medicines, claims could be found for the treatment or prevention of almost any disease known to man.

Twelve veterinary medicinals were seized for misbranding or for violation of the new-drug and antibiotic certification requirements.

Domestic drug and device shipments seized totalled 142 actions, based on 286 violative samples. Three injunction and 30 criminal prosecution actions were recommended for federal court action. Inspections were made of 3,215 drug and device establishments and 7,822 samples were collected. Of 3,429 import drug shipments inspected, 2,409 were refused entry because of failure to meet U.S. requirements.

During the fiscal year, 337 batches of insulin and insulin products and 18,183 batches of antibiotics were certified after passing tests for purity, potency and stability. Also certified were 776 batches of coal-tar colours, representing more than 5,000,000 lb. for use in foods, drugs and cosmetics. (G. P. L.)

Drug Production and Sales.—A rise of almost 20% from the preceding year in the volume of drug production in 1955 was

Table I.—U.S. Production and Sales of Medicinals

	1954	1955
Production	65,884,000 lb.	78,227,000 lb.

Other retail stores	612,570,000	676,490,000
Total	2,546,600,000	2,826,100,000

*Includes prescription accessories, first-aid products, foot preparations, veterinary medicines, feminine and baby medicaments.
Source: *Drug Topics* (March 5 and Aug. 6, 1956).

revealed in the reports of the U.S. Tariff commission. Sales were up nearly 29% in quantity, but the increase in the value of these sales was slightly more than 9%. As a result, the average per pound value of drug sales dropped from \$8.15 in 1954 to \$6.79 in 1955.

Expenditures for physicians' prescriptions were up more than 15% in 1955. The number of these prescriptions increased more than 9%, and the average price per prescription rose from \$2.21 in 1954 to \$2.33 in 1955. Approximately 98% of physicians' prescriptions were filled in the 53,500 drug stores in the United States.

Sales of nonprescription packaged medicines were up nearly 8% to set a record for the year. Sales of auxiliary health aids also increased, by almost 6%. Articles in this category include prescription accessories, first-aid products, foot preparations, veterinary medicines and feminine and baby medicaments.

In the export market, trade barriers, currency and foreign exchange restrictions, quota limitations and other restrictions imposed by foreign governments continued to restrict greatly and even to stop altogether the sales of U.S. drug exporters in some of their overseas markets. (P. C. O.)

Dulles, John Foster (1888–), U.S. cabinet member, was born on Feb. 25 in Washington, D.C. He graduated from Princeton university, Princeton, N.J., in 1908 and was awarded a law degree at the George Washington university law school, Washington, D.C., in 1911. In World War I he served as a major on the army general staff, and after that war went to the Paris peace conference as U.S. counsel on reparations and other financial matters. Between the two wars he became a prominent international lawyer. In 1945 he was a member of the U.S. delegation to the conference to organize the United Nations at San Francisco, Calif.

In 1951, as U.S. ambassador-at-large, he travelled to both Asia and Europe to arrange for agreement among the World War II Allies, the U.S.S.R. excepted, to a peace treaty with Japan, which was signed on Sept. 8 by Japan and 48 noncommunist nations. Dulles prepared the foreign-policy plank of the Republican party platform in 1952 and after the national election of that year was designated Pres. Dwight D. Eisenhower's new secretary of state. He was sworn into office Jan. 21, 1953.

Dulles created a minor political furor in Jan. 1956 with his published "brink" statement that "the ability to get to the verge (of war) without getting into the war is the necessary art. . . . If . . . you are scared to go to the brink, you are lost." He continued his extensive travels during the year, attending another SEATO (Southeast Asia Treaty organization) conference in Karachi, Pak., in March, and later visiting Formosa, Korea and Japan.

Dulles played a major role in the conferences and negotiations that followed Egypt's nationalization of the Suez canal July 26, 1956. It was at his suggestion that the Suez Canal Users' association of western nations was organized, after he had declared that the United States did not "intend to shoot (its) way" through the canal. Shortly after the outbreak of Israeli-Egyptian hostilities Oct. 29, 1956, Dulles was hospitalized for major surgery.

Dyes. The discovery of mauve, the first synthetic dye, by Sir William Henry Perkin in 1856 was honoured throughout the chemical world during 1956, culminating in a week-long celebration in New York. This event was sponsored by the American Association of Textile Chemists and Colorists with the cooperation of 27 technical, chemical and scientific societies.

The United States dye industry continued to maintain a high level of production during 1956 despite a slight downward trend of approximately 10%. This anticipated falling off was primarily caused by fluctuations in textile activity, while other colour-consuming industries remained relatively stable. The increasing number of numerous synthetic fibres being developed continued to claim the attention of dye research.

Sales of U.S. dyes in the export field were down to the same degree as domestic, caused by intensified activities of European producers in world markets and their lower production costs. No significant changes in the price structure of U.S. dyes occurred.

According to official figures released by the U.S. tariff commission, production of all types of dyes in 1955 amounted to 167,472,000 lb., an increase of 17.1% over the 142,982,000 lb. produced in 1954. Sales of all dyes in 1955 totalled 155,458,000 lb. valued at \$180,909,000, compared with 137,463,000 lb. value at \$160,302,000, an increase of 13% in quantity and 12.8% in value. The average unit value of all dyes sold was \$1.16 per pound in 1955, a one cent reduction from the previous year. The vat-colour group continued to maintain the lead in both production and sales, accounting for 33% of the 1955 production and 31.7% of the poundage sold; direct dyes represented 19.1%, sulphur dyes 15.3% and acid dyes 8.9%.

Four chemical classes of dyes represented 83.7% of the total production in 1955: azo dyes accounted for 35.6%, anthraquinone vat dyes 23.5%, sulphur dyes 15.2% and indigoid and thioindigoid 9.4%. These classes also showed considerably increased production over the previous year: the output of anthraquinone vat colours was 26.6% higher, azo dyes increased 14%, indigoid and thioindigoid dyes 12.4% and sulphur dyes were 13.1% higher.

Sales of vat dyes other than indigo amounted to \$49,234,000, direct dyes \$41,368,000, acid dyes \$20,429,000 and sulphur colours \$6,639,000. Foreign invoice value of U.S. dye imports in 1955 was higher than in 1954. Switzerland regained top position with 50.33% of total imports, West Germany was next with 45.13% and the United Kingdom accounted for 4.02% of the total.

(A. G. BR.)

Other Countries.—A working party of the Organization for European Economic Cooperation reported that the demand for dyestuffs, in the short-term, was expected to be stable although some fluctuations in export demand were possible. In the medium term, the working party considered that the activity of the textile industry would ensure a slightly increasing demand for dyestuffs on home markets. The development of the textile industry in overseas countries and the rising standard of living also suggested a slightly increasing demand for dyestuffs. Leaders of the industry tended to be less optimistic about the long-term prospects. They referred to increased competition, pressure on prices, the building up of the dye industry in countries which formerly had imported their requirements, import quotas and other obstacles.

An International Fastness Label association was formed in Zürich, Switz., to promote interest in dyes of high fastness to light, washing and weather. It was proposed to introduce an international label bearing the name Felisol to denote textile dyed with approved dyes according to prescribed methods.

"THOSE HATS MAKE GOOD TARGETS," a 1956 cartoon by Justus of the Minneapolis Star (Minn.)

An important development was the introduction in the United Kingdom by Imperial Chemical Industries of an entirely new type of dyestuffs, the procions, which, unlike any other dyes, reacted with cellulosic fibres.

Further progress was made with plans to manufacture dyestuffs on a large scale in India. Indian dye output in the first half of 1956 was reported to be about 50% greater than in the corresponding period of 1955. (L. E. Ms.)

Ear, Nose and Throat, Diseases of. Surgical Restoration of Impaired Hearing.—

A "simplified" technique for the restoration of certain types of hearing loss was proposed during 1956 by Samuel Rosen and endorsed by many other otologic surgeons who had followed the surgical principles of the mobilization of the fixed stapedial footplate. This is the tiny ossicle or ear bone of the middle ear which is shaped like a stirrup and which becomes immobile through the replacement of a small holding ligament by bony tissue.

During recent years several operative procedures had been developed for certain types of hearing loss resulting from middle ear disease. These included:

1. Fenestration by the creation of a new window connecting the middle ear with the inner ear, as a substitute for the normal oval window. The operation is used in cases where the stapes or stirrup bone of the middle ear is held down (ankylosed) by a bony growth in a condition called otosclerosis.

2. Tympanoplasty by the microscopically controlled removal of adhesions (scars), proud flesh and dead bone, for partial relief of hearing loss resulting from chronic inflammatory middle ear infections.

3. Stapes mobilization, which is also an operation for otosclerosis. The principle of this procedure is to loosen the stapes footplate from its fixed position in the oval window while leaving the ossicular chain intact.

It is unfortunate that the idea had been expressed that otosclerosis is a very common cause of impaired hearing and that stapes mobilization for otosclerosis is a "simple" operation. Neither of these notions is correct, according to Milos Baskak and E. P. Fowler, Jr. Stapes mobilization is admittedly less time-consuming for the surgeon, less costly to the patient, than, for example, fenestration, and there is rarely troublesome post-operative care.

A study by Rosen of the cases in which the attempt to mobilize the footplate did not result in improved hearing suggested the following possible explanations: (1) an extreme degree of fixation of the footplate which does not yield; (2) thin and fragile crura which fracture under the force required to mobilize the footplate; (3) faulty technique; and (4) still unknown factors.

Hypometabolism in Relation to Ear, Nose and Throat Disorders.—A. R. Hollender called attention to the fact that in ear, nose and throat practice, as in medicine in general, modern concepts of endocrinology had diverted attention from older knowledge. These revised concepts had often totally disregarded the significance of other pertinent factors, especially those related to the problem of metabolism. Hollender's feelings were shared by Jerome A. Hilger, who discussed hypometabolism and its relation to otolaryngology.

From the facts presented by both Hollender and Hilger, it seemed that in certain otolaryngologic disorders even a mild hypometabolic state may be the influencing factor. Sneezing, rhinorrhea, nasal discharge, hearing loss, headache and numerous other signs and symptoms have been ascribed to hypometabolism. Because the symptoms and signs are not clear-cut and easily recognized, the likelihood of endocrine dysfunction is rarely

considered. Experience had demonstrated that many clinicians regarded "subclinical" hypothyroidism to be of minor significance. Yet some degree of thyroid dysfunction may be present despite the fact that measured thyroid activity is normal. Results of therapeutic tests often serve as convincing evidence of functional irregularities.

The test most commonly employed in the past, and even at present, yields the determination of the basal metabolic rate (BMR). It remains the ideal method for most practical purposes, and while it is subject to inaccuracies from various influences, correctly and carefully performed it serves a highly useful purpose. More recently, use was made of the blood protein-bound iodine test (PBI).

This is a delicate test with definite advantages under certain circumstances over the basal metabolism test. In hypothyroidism, the result may be low or low normal.

Some confusion exists concerning the terminology employed to designate the subclinical form of hypothyroidism—hypometabolism—in which classical myxoedematous signs and symptoms fail to manifest themselves. Between the clinically obvious hypothyroid state and the normal there is a kind of no man's land in which the true or effective level of thyroid activity is not easily decided. In persons in whom a low basal metabolic rate is the only indication of hypothyroidism, clinical symptoms being absent, the dysfunction is probably a secondary process.

Nonmyxoedematous hypothyroidism—hypometabolism—produces definite changes in the nasal mucosa; is, according to Hollender, one of the underlying causes of vasomotor rhinitis; and frequently accounts for persistent postnasal discharge and, occasionally, for refractoriness of tubal obstruction, deafness and tinnitus. In growth of pharyngeal lymphoid tissue and in some headaches, alterations in metabolism sometimes play a prominent aetiological role.

Contrary to the general belief, patients with subclinical hypothyroidism do not become resistant to thyroid therapy; in fact, the drug can be withdrawn without disturbing effects if the causes of the hypometabolism are eliminated or corrected.

Lack of appreciation of the part played by endocrine dysfunction, more especially hypometabolism, in certain ear, nose and throat disorders could logically explain the futility of some time-honoured local procedures.

The Problem of Headache.—Head pain, which includes headache and neuralgias, is, according to Francis L. Lederer, to be regarded as a medical orphan. The patient complaining of headache deserves a complete physical, neurologic and ophthalmologic examination. Laboratory tests should be performed as necessary.

Howard D. Fabing discussed in detail tension headache as primarily caused by pull on the neck muscles. These cases require more than prescriptions. Careful history taking and a thorough physical examination should be followed by reassurance and explanation. Posttraumatic headache is regarded as similar to psychoneurotic headache, differing in that it follows a trauma to the head, usually severe enough to produce unconsciousness; it is frequently associated with sensitivity to noise and a subjective sensation of vertigo, usually brought about by a sudden change of the position of the head. Fabing found that migraine sufferers were driving persons with high ambitions and that their headaches were readily touched off by trivialities. These persons were characteristically perfectionists who complained of "bilious attacks," "sick headaches," "weak stomachs" and so on.

Paul S. Pentecost and John Adriani described an atypical head and face pain which may originate in the neck and can be diagnosed as well as controlled by blocking the nerves in the cervical plexus. According to A. Curtis Jones, Jr., headaches can be caused

by hypothyroid states and can be relieved by the administration of thyroid extract.

Functional Swallowing Disturbances.—Conditions affecting the function of swallowing but not the organ structure were discussed by John R. Lindsay. Changes in muscle action, alterations in innervation (nerve supply to the muscles) or disturbances of psychic (emotional) control are the common causes of functional swallowing disorders. The muscles of the soft palate, the constrictors and elevators of the pharynx and the muscles that close the upper aperture of the larynx (voice box) propel food through the pharynx. The action of these muscles is readily observed by direct examination with instruments, and symptoms of weakness or failure to function may be recognized. After the patient swallows a thick barium (radiopaque) mixture the action of the pharyngeal constrictor muscles and the cricopharyngeal sphincter muscle may be demonstrated on fluoroscopic examination or with spot X-ray films, special positions and manipulations. X-ray studies plus the use of parasympathetic-acting drugs were employed by Stanley H. Lorber and Harry Shay to differentiate spasm and irregularity of action of the oesophagus and to provide a basis for treatment.

Symptoms of choking, dryness, burning, irritation, pain or a lump in the throat often denote psychic (emotional) disturbances. Such a disorder occasionally may be associated with organic disease, since severe anxiety or depression may be prominent with early malignant conditions. Psychogenic difficulty in swallowing (dysphagia) differs widely in severity, and X-ray and endoscopic (wherein a tube is passed down into the oesophagus through the mouth to reveal the entire passage) examinations are essential to exclude organic causes such as tumours, ulcers and the like.

In severe cases of neurosis, hysteria and even psychosis, psychiatric therapy may be required.

Economics. Economic and industrial developments in 1956, the world around, continued to direct the attention of a sizable group of economists toward the subjects of growth patterns of backward areas, regional economics, locational analysis and the significance of technological change. The shift away from concern over the concepts and the models of static equilibrium and economic maturity continued through the first three-quarters of the year in both publication titles and research agenda. In view of the increased importance of cer-

tain newly significant raw materials, not ordinarily found in the highly industrialized areas, the old and oversimple distinction between the "have" and "have not" nations was disappearing. At the same time the so-called "backward" countries were providing useful laboratories for the observation of accelerated economic dynamism.

Population increases, rising standards of living, technological advances and continued high governmental expenditures kept aggregate incomes high in nearly the entire western world. In Britain, for example, the situation throughout the first half of 1956 could be described as one of more than full employment with moderately essential jobs going unfilled because of lack of man power. In the United States, in spite of a serious inventory cycle in the automotive industry, the gross national product again broke records at an annual rate of more than \$400,000,000,000 by the third quarter of 1956. This prolongation of postwar prosperity for another year led to a further reconsideration of theories with reference to the business cycle and economic fluctuations.

Theorists of the more nearly traditional stripe commented that western capitalism was the lucky beneficiary of the failure of dynamic depressants since the war to cause serious trouble. Difficulties had appeared but had always been counteracted effectively.

Optimists hoped that this dynamic pattern might continue. Pessimists saw no reason to rule out the possibility of a developing conjuncture of local depressants. They pointed to the possibility of inventory trouble appearing simultaneously in several important industries, expressed concern over the unprecedented volume of consumer and residential mortgage indebtedness, predicted some downward readjustments in stock market prices and were fearful about the effects of tightened bank money lending policies. They were sceptical about a prosperity built largely on the demand for durable consumables, high private investment and high governmental expenditures continuing indefinitely. Even these pessimists, however, saw nothing in the situation forecasting a repetition of the early 1930s. The dominant attitude was one of cautious optimism.

More forward looking theorists re-examined the depression-born work of J. M. Keynes to find the keys to continued prosperity, and the ideas of Joseph Schumpeter with his emphasis on dynamism and innovation. Developments in collective bargaining stimulated concern over certain aspects of wage theory. Statisticians continued to provide improved materials for induction, and abstract theorists, chiefly the econometricians, continued to sharpen the tools of deductive logic.

In 1956 as in 1955 price theorists, especially in their role as assistants in policy-making, were less concerned over the tradition-bound concepts of competition, oligopoly and monopoly and more interested in possible workable compromises between competition and oligopoly—workable total situations in markets containing elements which theorists of a few decades ago would have classified as monopoloid. Such objectives as the provision of cheap and plentiful goods for consumers, the insurance of continuity of production and the setting-up of a system of incentives for rational, careful and persistent innovation seemed to many modern price theorists to be more rational than those relating to maintaining specific market structures consistent with the competitive models of earlier times. The phrases "counter-vailing power," "workable competition" and "workable oligopoly" suggested this new emphasis. Ecuador. A republic on the west coast of South America, straddling the equator, after which it was named. Ecuador is bounded on the north and east by Colombia, on the east and south by Peru and on the west by the Pacific ocean. It has an area of 105,743 sq.mi. (including the Galápagos Islands, a dependency of 3,029 sq.mi.) and a population (1950 census) of 3,202,757; (1955 official estimate) 3,675,000. About 60% of this figure represents Indians, 30% mestizos, 9% "whites" and 1% Negroes. Quito (pop. 1950 census, 209,932, 1954 est., 212,873) is the capital; other major cities (with 1950 census, 1954 est. in parentheses) are Guayaquil, the main port, 258,966; Cuenca 39,983 (53,871); Riobamba 29,830; Jipijapa 7,759 (8,000); Vinces 3,748; Chone 8,046 (10,000); Ambato 31,312; Loja 15,399 (18,000); and Latacunga 10,389 (18,000). The predominant religion is Roman Catholic. Presidents in 1956: José María Velasco Ibarra until Aug. 21; thereafter Camilo Ponce Enríquez.

History.—Pres. José María Velasco Ibarra, finishing his first full term in 1956, relinquished the office to Camilo Ponce Enríquez, the first Conservative to win the presidency in 60 years. The Conservative victory in the election on June 3 did not represent a marked increase in party support, the Liberal vote being split between three strong candidates.

The presidential campaign began in earnest in January and February, when the various parties convened to select slates. The Conservatives' Ponce Enríquez was expected to have a strong following, but the Frente Democrático Nacional and the Concentración de Fuerzas Populares appeared to have somewhat better prospects of winning. The Frente, a coalition of Liberals, Socialists and independents, selected Raúl Clemente Huerta as standard bearer after prolonged convention balloting. Carlos Guevara Moreno was the C. F. P. candidate. An independent who entered the race with the support of moderate Conservatives and Liberals, and for whom the followers of Velasco Ibarra later declared themselves, was José Chiriboga Villagómez, former ambassador to the United States.

Clemente Huerta seemed to be the strong contender as the campaigning neared its climax. However, Velasco Ibarra, an important factor, revealed a preference for Conservative Ponce Enríquez shortly before the election. The margin of victory was small; Ponce Enríquez received more than 178,000 votes, Clemente Huerta in excess of 175,000 votes, Guevara Moreno nearly 150,000 votes and Chiriboga Villagómez more than 110,000 votes.

Serious threats to the continuity of orderly government occurred on June 29 and Aug. 8. President Velasco Ibarra was advised while en route to Riobamba that a garrison revolt was pending upon his arrival. He turned back to Quito in his plane, and loyal troops arrested officers who had conspired to exile the president and to replace him with Col. Reinaldo Varea Donoso, a former defense minister. A more subtle diversion by disgruntled opponents of the Conservative president-elect was a boycott by deputies of the inaugural session of the lower house. It was designed to prevent the chamber from approving his inauguration. Faced with the prospect of losing certain privileges of office, however, the opposition became more tractable, and the ceremony took place on the scheduled day of Aug. 21. His cabinet appointments reflected the delicate position in which Ponce Enríquez, as a minority-party president, had been thrust. It was composed of Liberals, Social Christians and Conservatives.

Normal relations were re-established with Peru in February, when both countries agreed to exchange ambassadors. The border problem was unsettled, but no incidents disturbed the peace. Foreign petroleum companies were granted exploratory rights near the Colombian border and new concessions on the Santa Elena peninsula. (R. HN.)

Education.—In 1952 there were 3,706 primary schools with 7,487 teachers and 352,396 pupils and 182 secondary schools with 1,031 teachers and 32,390 pupils. Institutions of higher learning included four public universities, the Catholic university of Quito and the polytechnical school; they had a total of 411 teachers and 4,562 students in 1952. According to the 1950 census, 43.7% of those 10 years of age and over were illiterate.

Finance.—The monetary unit is the sucre, valued during 1956 at 6.6 cents U.S. currency, official rate, and on Oct. 15, 1956, at 5.17 cents, free rate. Ordinary revenue in 1955 was 730,270,000 sucres; ordinary expenditure, 665,735,000 sucres. The foreign debt on Dec. 31, 1955, was \$37,087,000; internal, 337,407,000 sucres. Currency in circulation (Sept. 30, 1956) was 740,000,000 sucres; demand deposits, 619,000,000 sucres. The U.S. department of commerce estimated U.S. direct private investments in 1955 at \$25,000,000. The cost-of-living index (Quito) stood at 99 in Sept. 1956 (1953=100). National income was estimated at 9,100,000,000 sucres in 1955.

Trade and Communications.—Exports in 1955 (Ecuadorian ports) totalled \$89,663,000; imports through the port of Guayaquil, \$88,751,000. Chief exports were bananas (41%), coffee (26%), cacao (21%), rice (3%) and crude petroleum (1%). Important imports included machinery, instruments and vehicles (32%), food, drink and tobacco (13%), metals and manufactures (13%) and textiles (12%). Leading customers were the U.S. (61%), western Germany (9%), Colombia (6%), Belgium (4%) and Italy (3%); leading suppliers, the U.S. (52%), western Germany (11%), the U.K. (6%), Belgium (6%) and Canada (5%).

Railway mileage is 698; in 1955 the railroads carried 553,818 metric tons of freight and 2,678,566 passengers. Mileage of roads suitable for motor vehicles was estimated in 1955 at 6,000–6,500. On Jan. 1, 1954, there were 5,500 automobiles, 10,000 trucks and 2,300 buses. Telephones (Jan. 1, 1955) numbered 12,000, 60.8% of which were automatic.

Agriculture.—Production estimates for the 1955–56 crop year included coffee 375,000 bags of 132 lb. each; cotton 15,000 bales of 480 lb. each; cacao 60,000,000 lb.; rice (rough) 250,000,000 lb. Exports in 1955 included bananas 26,150,000 count bunches (50 lb. each); coffee 384,000 bags; cacao 24,409 metric tons; rice 20,749 tons. Unofficial estimates placed the number of cattle at more than 2,000,000 and the number of sheep and goats at 2,000,000 in 1952. Forest exports in 1955 included tagua nuts 6,428 metric tons; balsa wood 3,999 tons. No rubber was exported in 1953–5.

Manufactures.—Production estimates for 1955 included sugar 70,478 metric tons; cement 146,287 tons; salt 49,965 tons; beer 56,974,000 bottles. Exports of *toquilla* (Panamá) hats totalled 1,285,000. Installed electric energy capacity (Dec. 31, 1955) was 63,000 kw.; production in 1955 (public use only) was about 212,000,000 kw.hr.

Minerals.—Production in 1955 included gold 15,289 troy oz.; silver 47,500 oz.; copper 15,289 kg.; lead 157 metric tons; crude petroleum 3,530,600 bbl. (J. W. Mw.)

Eczema: see DERMATOLOGY.

Eden, Sir (Robert) Anthony (1897–). British statesman, was born at Windlestone hall, near Bishop Auckland, Durham, Eng., June 12, and was educated at Eton college and at Christ Church, Oxford. In 1923 he was elected to the house of commons. In 1931 he became undersecretary of state for foreign affairs. He was made lord privy seal in 1934 and minister for League of Nations affairs a year later. Eden became foreign secretary in 1935 but resigned in 1938 because of disagreement with Neville Chamberlain's policy toward Italy. At the outbreak of World War II he returned to government as dominions secretary, and when Winston Churchill became prime minister in 1940 Eden was appointed secretary of state for war and, later that same year, foreign secretary. He was appointed deputy prime minister and foreign secretary in 1951, and on April 6, 1955, he was appointed prime minister.

Eden arrived in the United States on Jan. 30, 1956 with foreign secretary Selwyn Lloyd and, after meetings with Pres. Dwight D. Eisenhower and John Foster Dulles, secretary of state, he flew to Ottawa, Ont., for discussions with the Canadian prime minister, Louis St. Laurent.

In a debate on March 12 Eden was put on the defensive by Hugh Gaitskell concerning the alleged mishandling of middle eastern affairs; at this time his prestige as a statesman seemed to be diminishing even in the eyes of his supporters.

He presided at the conference of Commonwealth prime minis-

ters, June 28–July 6. After Pres. Gamal Abdel Nasser's announcement on July 26 of the nationalization of the Suez canal, Eden said to parliament on Aug. 2 that various "precautionary measures of a military nature" were being taken. In a radio and television broadcast on Aug. 8 he declared "we do not seek a solution by force, but the broadest possible international agreement."

After the outbreak of larger-scale hostilities between Israel and Egypt (Oct. 29), Eden announced to parliament the Anglo-French ultimatum to the combatants. The next day followed Anglo-French military action against Egypt which, he declared, was not war but "armed conflict." The general assembly of the UN having voted overwhelmingly (Nov. 2) against the attack, Eden made a radio and television broadcast in which he stated that the invasion of Egypt was "police action" and declared that "if the United Nations would take over the police action we would welcome it." Events and world opinion seemed to be too much for Eden and he ordered a cease fire to take effect from Nov. 6. He was visibly a tired man and on Nov. 19 he was persuaded by his medical advisers to take a rest and flew to Jamaica for a holiday on Nov. 23.

Besides many foreign indications of disapproval of his policy, he had to face at home the resignations of two junior ministers; allegations in the press that R. A. Butler was in strong disagreement with him; and newspaper and opposition demands for his resignation. Nevertheless he was still considered to have considerable support for his actions.

Education. The outstanding events in education in the U.S. from Oct. 15, 1955, to Oct. 15, 1956, included the following: (1) the persistence of the shortage of qualified teachers, sufficient funds for educational activities and adequate school buildings; (2) the consistent rise in school attendance for the 12th year in a row; (3) the White House Conference on Education, which drew attention to the need for more and better schools; (4) the defeat in congress of a bill for federal aid to education; (5) the constant rise of the number of college students, indicating the beginning of the tidal wave expected for 1960; (6) the continuing slow progress of racial integration in education in the face of active opposition in some southern and border states; (7) the end of the G.I. Bill of Rights, which provided opportunities in education on the secondary and higher levels to large numbers; (8) the growing recognition of the shortage of brain power, especially scientists and engineers, and the factors associated with limited enrolments in those fields, such as poor teaching; (9) the increasing concern in educational, governmental and other circles over the education of the gifted child and youth; and (10) the rapid growth of the movement for the use of television in teaching on all scholastic levels.

Statistics.—Early in September the U.S. office of education of the department of health, education and welfare released its annual estimate of enrolment for the year 1956–57 as follows: kindergarten through grade 8, public, private and parochial, 29,618,000, an increase of 1,103,800 over the previous year; secondary schools (grades 9 through 12), public, private and parochial, 8,111,600, a rise of 364,500; higher education, 3,232,000, or 236,000 more than in 1955–56; private commercial and nurse training schools, 591,400, or 50,000 over the figure of the previous year. The grand total of 41,553,000 marked an increase of 1,754,300 and represented 24.9% of the entire population of the U.S.

The office of education also reported the following significant facts: a shortage of 51,400 classrooms in the elementary and secondary schools to accommodate increased attendance; the need for 120,700 additional qualified teachers, which would have to be supplied by emergency teachers, the return of former teachers and overcrowding of the classes; and predicted increase

in enrolment of 30% from 1956 to 1965.

Federal Participation in Education.—The White House Conference on Education, which had been called by Pres. Dwight D. Eisenhower in an effort to obtain information about the school crisis, took place in Washington during Nov. 28–Dec. 1, 1955. About 1,700 delegates, representing 48 states and five territories, arrived to deliberate on six major questions of importance to education in the U.S.: (1) What should our schools accomplish? (2) In what ways can we organize our school systems more efficiently and economically? (3) What are our school building needs? (4) How can we get enough good teachers—and keep them? (5) How can we finance our schools—build and operate them? (6) How can we obtain a continuing public interest in education? The most dramatic outcome of the conference was the approval by the delegates, by a vote of more than two to one, of the principle that the federal government should increase its financial participation in public education, in particular for the construction of school buildings. Significantly, the delegates voted almost unanimously to oppose any attempt by the federal government to control the money granted to local schools other than to require a fiscal accounting by the states. The final report of the Committee for the White House Conference on Education to the president, on April 6, 1956, was less enthusiastic about the principle of federal aid. Its point of view was that federal funds "should be provided under the philosophy of encouraging greater use of state and local funds for school purposes"; that "the best schools can be produced by continuing to assign to the states and local districts primary responsibility for financing, organizing, administering and controlling the public schools"; and that federal aid "to all the states can be justified . . . only on a temporary basis to meet an emergency situation such as the present school building emergency."

In his special educational message to congress, Jan. 12, President Eisenhower strongly urged annual federal grants of \$250,000,000 a year for five years "to supplement local construction efforts in the neediest school districts," as well as a total of \$750,000,000 in federal credits over the same period of five years to stimulate local school authorities to construct the estimated 470,000 needed classrooms. When action on the school construction bill was still being held up by the house of representatives, the president, in his letter of May 14 to Neil McElroy, chairman of the Committee for the White House Conference on Education, made a special plea for a congressional law to furnish federal aid to help meet the school emergency. He pointed up this need for federal aid to education as "one of the major goals" of his administration.

After much delay, the Kelley bill (H.R. 7535), which differed in details from the president's plan, came up on July 5 for a vote before the house of representatives. The situation had become even more controversial than usual because of the Powell amendment, which specified that no funds were to be given to states which failed to comply with decisions of the supreme court. This was an obvious reference to the attitude of many southern states to the supreme court decision declaring unconstitutional the practice of racial segregation in the public schools. The complication was illustrated in the voting: 148 Republicans and 77 Democrats supported the Powell amendment, and 140 Democrats and 46 Republicans opposed it; 119 Democrats and 75 Republicans favoured the Kelley bill (including the Powell amendment), while 119 Republicans and 105 Democrats voted against it.

The following months saw charges and countercharges by both political parties as to the responsibility for the defeat of the bill. The major outcome of the congressional struggle over federal aid to education was that no positive action was taken.

during the year. Educators and interested laymen were beginning to wonder if there was any possibility for legislation for any kind of federal aid to school construction, let alone for the broader programs of federal educational aid.

Congress passed several laws of concern to education during 1955-56. Public law 597 (June 1956) provided a five-year program of federal grants up to \$7,500,000 each year to the states for the improvement of library services in the rural parts of the country. Public law 465 (April 1956) extended and increased the special school milk program through 1958. Other acts were the extension until 1958 of public laws 815 and 874 (81st congress), which offer funds for the construction and operation of schools in localities affected by federal activities, and grants for the education of nurses and public health specialists.

President Eisenhower appointed in April a National Committee for the Development of Scientists and Engineers "to foster the development of more highly qualified technological manpower." Later in the same month he set up a Committee on Education Beyond the High School to study the problems of higher education, professional education and adult education and to recommend policies for federal action.

Elementary and Secondary Education.—Late in Nov. 1955 the National Manpower council issued a report, "Improving the Work Skills of the Nation," in which it urged the nation to improve its high schools by stressing the fundamental subjects and work habits, so that there would be an adequate supply of skilled manpower to meet the technical competition of the U.S.S.R. All through the year, educators and other specialists continued to assess the teaching of specific subjects in the schools. At the February meeting of the American Association of School Administrators, various leaders admitted the shortcomings of the schools' instructional program, but insisted that the children of today can spell, read and write as well as their parents can. Defenses of educational work were previously made, in November, by two bodies of teachers. The National Council of Teachers of English upheld the current procedures used in the teaching of reading, while the National Council for the Social Studies praised the teachers and the pupils of the nation for the children's interest and alertness in national and world affairs. The New York state education department announced in June that 45% of the high schools require two years of United States history, as compared with 25% in 1946. Of further interest to the teaching of the social studies was the suggestion by President Eisenhower in September that the schools teach the facts of communism, so that the children could "discriminate between truth and falsehood . . . between the American form of government and the Soviet form."

Much attention was showered upon the teaching of science and mathematics during 1955-56. In many instances, comments upon the insufficient number of pupils in these subjects were accompanied by warnings that the U.S.S.R. was forging ahead in scientific and technical education. One scientific authority, Pres. A. DuBridge of the California Institute of Technology, claimed in July that improper teaching and inadequately prepared teachers were responsible for the avoidance of science and mathematics by high school pupils. Several weeks earlier, in June, DuBridge had stressed the importance of a larger and better supply of scientific personnel, but urged that Americans should not get hysterical over statements that "the Russians are getting ahead of us." A survey reported by Purdue university in September revealed that high school pupils were not interested as a rule in careers in the field of science. Only two days later the National Association of Secondary School Principals announced the results of a survey which indicated that many of the current high school graduates about to enter college were attracted to careers in engineering and science. Other

TWELVE-YEAR OLD HARVARD FRESHMAN, Fred Safer, Jr. (right), registering for classes at the opening of the 1956 fall term. Safer was given a scholarship after making a perfect mark in advanced mathematics in his college entrance examination

items of interest were the results of a survey by the Educational Testing service, reported in June, showing that teachers of mathematics were poor in knowledge and teaching ability; and the announcement by the office of education, also in June, that enrolments "in mathematics and in principal science courses in high school are larger now than they were 20 years ago." While there was an apparent lack of agreement about the facts of the situation, it was evident that some concrete steps were being taken by educational authorities to improve the situation in the teaching of science and mathematics in the high schools of the country.

There was some action during the year to encourage gifted children and youth. More than 60,000 selected high school seniors in 10,800 schools all over the country in Oct. 1955 took tests to determine the 445 winners of college scholarships under the new national merit scholarship program. The highest scorers on the first test took subsequent tests after the start of the new year, and the successful candidates were named in the spring. Late in November Charles C. Cole, Jr., assistant dean of Columbia college, Columbia university, proposed on the basis of a survey published several months later, an annual program of 100,000 scholarships costing \$200,000,000 to make it possible for gifted young persons to go to college.

The use of television in education was greatly stepped up in 1955-56. In Dec. 1955 the Ford foundation made grants totaling \$6,493,840 to the Educational Television and Radio centre and the Joint Council on Educational Television, located at Ann Arbor, Mich., and Washington, D.C., respectively, for the co-ordination and expansion of educational television. The council reported in June 1956 that there were 25 stations on the air and that seven more communities were expected to set up stations for the transmission of television programs devoted to education. Schools in various communities and colleges all over the country made use of closed circuit television programs in

their educational work. Much attention was given in the press to the project in Hagerstown, Md., which began in September to teach the basic and other subjects in the curriculum by means of regular television lessons. Opinion was divided among educators as to the role of television in classroom instruction.

Higher Education.—The continuous increase in higher educational enrolments was shown in the estimate revealed in Dec. 1955 by the U.S. office of education, 2,716,000, or 8.6% greater than the previous year, "an all-time record," according to Commissioner Samuel M. Brownell; and in the figure published by Raymond Walters in *School and Society* (Dec. 10, 1955), 1,612,225 full-time students in 886 approved colleges and universities, a 9% rise over 1954. The Veterans administration reported in November an attendance of 341,000 college students under the Korean G.I. Bill of Rights, 50% more than in 1954.

On July 25 the G.I. Bill of Rights for World War II veterans was concluded, except for the voluntary enlistees of the year Oct. 1945 to Oct. 1946. Since 1944 more than 7,800,000 veterans, or 50% of those who had served during the war, had taken advantage of the law giving them educational benefits, with large numbers attending colleges.

Some improvement took place during the year with regard to professors' salaries. Increases were announced by a number of institutions, in some cases up to 25%.

The foundations were active in allocating financial grants to colleges and universities. Late in Dec. 1955 the Council for Financial Aid to Education estimated a total of \$507,000,000 in grants and gifts to all types of institution during the fiscal year 1954-55. The council also reported in Sept. 1956 that 49 business firms gave almost \$25,000,000 for higher education in 1955. In June seven noted private universities adopted an eight-point guide for soliciting unrestricted gifts from industry for independent teaching and research.

The Ford foundation gave the largest sums to the most institutions: Dec. 1955, \$1,600,000 for the revision of the Yale law school curriculum, \$210,000,000 to raise the salaries of professors in private liberal arts colleges and \$90,000,000 to improve instruction in private medical colleges; April 1956, \$296,000 to expand international law studies at Cornell university; June, \$1,275,000 for international relations studies at Columbia university; September, \$570,000 for fellowships in economics and business administration to encourage teaching and research in these fields; and October, \$1,725,000 for a five-year program to stimulate and support the publication of scholarly studies in the humanities and the social sciences. Other grants were as follows: Fund for the Advancement of Education, \$502,000 to 34 public and private colleges for improving their teaching resources as enrolments mount (April); Carnegie corporation, \$1,500,000 to the Institute of International Education (February), \$750,000 for research institutes in higher education at the University of California and at Teachers college of Columbia university (May) and \$375,000 for a centre on higher educational statistics at the American Council on Education (May); U.S. Steel foundation, more than \$1,000,000 to more than 500 higher educational institutions (April); Commonwealth fund, \$7,150,000 for medical education (Nov. 1955); and Sealantic fund, \$10,375,000 for theological education (Dec. 1955).

The importance of providing opportunities for higher education to all who are capable of it was frequently stressed during the year, especially in a statement prepared in March by the American Council on Education for the use of the President's Committee on Education Beyond the High School. This was published later in the form of a 125-page book, *The Strength to Meet Our National Need*. The enrolment pinch was already beginning to be felt in 1955-56 all over the nation. *New York*

Times surveys in June showed qualified students were denied admission to colleges in New York state because of the shortage of facilities and that most state universities were limiting the number of students from other states.

The problem of enrolments and instruction in science and engineering was the object of much concern during the year. In January the Massachusetts Institute of Technology announced that it would establish a school for advanced study for advanced theoretical studies and research in the sciences, while the Rockefeller institute revealed plans for the opening of a graduate school to develop research experts in the natural sciences. With reference to enrolments, numerous speakers and writers reminded the nation of the insufficient scientists and engineers being trained. Very often comparisons were made with the production of scientists and engineers in the U.S.S.R. Thus, the National Science foundation reported in August that Soviet institutions graduated twice as many scientists in 1955 as did those in the U.S. On the other hand, some warned of the dangers of unlimited expansion in these fields. In the spring, the Engineering Manpower commission of the Engineers Joint council disclosed that engineering enrolments were rising so rapidly as to outstrip available funds, facilities and faculties in the professional schools. More particularly, the American Society for Engineering Education stated late in June that there would be a shortage of 1,300 engineering teachers for 1956-57 enrolments. Warnings that too much stress on the need for scientific personnel and pressure for students to enrol in science courses would result in the weakening of the humanities and the social sciences were made at the Oct. 1956 conference of the American Council on Education.

In spite of the fact that there was a record number of students of medicine, as reported by the American Medical association—28,639 in about 80 schools—there were demands in medical circles for the solution of the "critical" shortage of physicians. The financial plight of the dental schools was pointed up in the Oct. 1956 convention of the American Dental association.

Other events in higher education during 1955-56 included the following: the placing on probation, in May 1956, of Texas Agricultural and Mechanical college, the University of Kansas, Mississippi college, Alabama Polytechnic institute, the University of Louisville and the University of Florida by the National Collegiate Athletic association for violation of rules of athletic competition; the penalization and placing on probation also in May, of the University of Washington and the University of California at Los Angeles by the Pacific Coast conference, and the approval of these decisions by the N.C.A.A. in August; the decision by the University of Illinois in Dec. 1955 to discontinue the teaching of remedial English in 1960; and the establishment in Oct. 1956 of a clearinghouse of private and public colleges for the co-ordination of research projects and for the co-operative use of faculty members.

The Teacher Situation.—The ninth annual report on teacher supply and demand by the National Education association, released in April 1956, indicated that 96,000 new teachers (38,731 for elementary schools and 57,348 for high schools) would be graduated in June. This was an increase of 9.9% over the figure for the previous year. Nevertheless, there was a shortage of 190,000 teachers, according to the report.

The salary question involving teachers played an important role in many communities. Some, such as Long Beach, N.Y., raised the maximum salary for teachers to \$9,500 a year. In May the teachers of Irvington, N.J., went on strike for a day to emphasize their need for salary increases. The board of education of New York city voted in May to raise the salaries of the teachers and to compensate high school teachers for extra-

curricular activities after school hours, but dissatisfaction remained and the boycott of such activities was not called off.

Other developments in teacher circles included the decision by the N.E.A. in July to campaign strongly in behalf of federal aid to education, the ruling by the American Federation of Teachers in August to expel eight southern chapters if they did not end racial segregation of teachers by the end of 1957, and the announcement in January by the U.S. department of labour of plans to recruit retired army officers and other former military personnel to teach in high schools.

Adult Education.—In June 1956 President Eisenhower signed public law 597, which granted \$7,500,000 a year for five years to libraries in rural communities having fewer than 10,000 persons. The president stated that the new law "shows promise of leading to a significant enrichment of the lives of millions of Americans." Another action which was expected to benefit adult education was the establishment in September of the Council on Library Resources with a \$5,000,000 grant from the Ford foundation. The aim of this new organization was to search for new procedures and devices to enable the libraries to give better and faster service, especially in connection with research activities. A survey by the New York state education department revealed on Oct. 13, 1956, that more than 1,000,000 inhabitants lived in communities that had no public libraries, that almost 400,000 lived too far from the libraries in their towns or districts and that several hundreds of thousands more lived in villages which supported libraries failing to meet the minimum standards of library service.

Academic Freedom.—In April the U.S. supreme court, in a five-to-four decision, ruled that the board of higher education of New York city did not have the right to dismiss Harry Slochower, associate professor of German at Brooklyn college, for invoking the privilege of the 5th amendment against self-incrimination in regard to membership in the Communist party. The court stated in the majority opinion, "At the outset we must condemn the practice of imputing a sinister meaning to the exercise of a person's constitutional right under the Fifth Amendment." Subsequently, near the end of May, the supreme court refused to hear the appeal of New York city, in spite of the fact that it was supported by the supreme courts of eight states and Hawaii.

There were several developments involving the issue of communism in education and related questions. The federal district court in Washington, D.C., acquitted Barrows Dunham, former professor of philosophy at Temple university, on Oct. 19, 1955, of charges of contempt of congress with regard to the use of the 5th amendment. The trustees of American university, late in Oct. 1955, dismissed Herbert Fuchs, professor of law, who had admitted to a congressional committee that he had once been a communist. In Nov. 1955 the New York state court of appeals ordered that a court trial be given to Charles W. Hughes, who had been dismissed from the faculty of Hunter college for refusing to give information about alleged communist affiliations. The state circuit court of Illinois in March 1956 upheld as constitutional the Broyles law, which requires teachers to take an oath that they are not communists.

On April 13 the federal district court in Washington, D.C., found Marcus Singer, professor of zoology at Cornell university, guilty of contempt of congress for not wishing to identify former communist colleagues. On the other hand, on the same day, the federal district court in Dayton, O., freed Lee Lorch, a professor at Fisk university, from charges of contempt of congress for not answering questions by the house committee on un-American activities. Commissioner Frederick M. Raubinger of the New Jersey state department of education in May ordered the board of education of Newark to reopen the cases of three teachers who had invoked the 5th amendment. In June the trustees of

Dickinson college dismissed Laurent R. LaVallee because of his refusal to answer the questions of the house committee on un-American activities. The Pennsylvania state supreme court, also in June, ruled that teachers may be discharged on grounds of incompetency if they do not want to say whether or not they have ever been communists.

Commissioner James E. Allen, Jr., of the New York state department of education handed down a ruling in August which stated that teachers could not be forced to mention the names of other teachers who were or had been affiliated with the Communist party. A bitter controversy was ended in August with the approval by the New Jersey senate of John O. Bigelow as a member of the board of governors of Rutgers university. Judge Bigelow had been opposed by some senators because, in his capacity as a lawyer, he had represented a client who had invoked the 5th amendment and because he had doubted that a teacher should be discharged on the sole ground of pleading the 5th amendment at a congressional investigation.

The Race Problem.—The issue of integration of the races in the schools of the south was a very complicated one during 1955-56. Early in Oct. 1956 the Southern Education Reporting service revealed that 650 out of 3,711 school districts with Negro children in the 17 southern states (plus the District of Columbia) had completed or had begun the process of integrating the public schools. This involved the educational contact of 319,184 Negro children with nearly 2,000,000 white pupils, leaving about 2,400,000 Negroes in districts that were still segregated. The current figure of integrated Negro pupils represented an increase of about 60,000 over that of 1955. There was a net increase of 208 school districts engaged in the integrating process since the start of the 1955 school year. There was no desegregation at all in Alabama, Florida, Georgia, Louisiana, Mississippi, North Carolina, South Carolina or Virginia. The only area that had completely integrated its public school system was the District of Columbia, but integration of about 85% of the Negro pupils was under way in Maryland and Missouri.

On the level of higher education, the Southern Education Re-

FORMER MAU MAU TERRORISTS, detained in a Kenya work camp, being issued news sheets printed in the vernacular, part of the re-education program carried on in 1956 by British colonial officials for Kikuyu tribesmen

porting service stated that 110 out of 208 tax-supported colleges and universities in the southern states either admitted Negroes or were willing to do so.

Negro students were actually in attendance in about 100 institutions in 12 of the 17 states and in the District of Columbia, but they were still barred from the white public institutions of higher education in Alabama, Florida, Georgia, Mississippi and South Carolina.

From the statistical standpoint, there was evident progress in the campaign toward integrated schools. By way of contrast, there were signs which indicated that resistance to efforts at desegregation would continue. Thus, at the beginning of the 1956-57 school year, violence resulted when Negro children entered white schools in Kentucky, Tennessee and Texas, while less serious demonstrations of opposition took place in Maryland and West Virginia. Prosegregation laws were enacted in Virginia, and some states made attempts to ban through court action the National Association for the Advancement of Colored People.

The U.S. supreme court on March 5 unanimously affirmed the decision of a federal court prohibiting racial segregation in tax-supported colleges and universities, thus extending to higher education the principle laid down in the decision of May 17, 1954. The following week, the supreme court ordered the law school of the University of Florida to admit Virgil D. Hawkins, a Negro, without delay. When the case remanded to the supreme court of Florida, the state's attorney general requested the court to delay the Negro applicant's admission to the university, in spite of the U.S. supreme court decision. Early in May the U.S. supreme court upheld a lower court decision compelling Louisiana State university to admit a Negro applicant to its undergraduate college.

Because of the previous rulings by the supreme court against racial segregation in the public schools, and no doubt because of anticipated similar decisions in the future, there developed a demand among congressmen and states attorneys general to curb the court's power to invalidate state laws in conflict with national legislation.

In apparent disagreement with the statement by President Eisenhower on March 21 that "it is incumbent on all the South to show some progress" toward compliance with the policy of racial integration in the public schools, some of the southern states not only did not show any progress but also took steps to make segregation as strong as possible. In Alabama a Negro student, Autherine J. Lucy, who had been admitted to the school of education of the University of Alabama in February, was suspended after violence developed. After the federal district court of Birmingham ordered the reinstatement of Miss Lucy, the university expelled her for having made accusations against the institution in her court appeal. This expulsion was not overruled when the Negro student appealed once more in August to the federal court.

Among the other significant events affecting the racial issue in education were the following: students at the Georgia Institute of Technology forced the authorities to allow the football team to play an intersectional game in January with the University of Pittsburgh, despite the presence of a Negro player on the latter team; national attention was given by President Eisenhower and the press to the successful start by Louisville, Ky., in integrating its public schools; violence directed against desegregation in August and September at Mansfield, Tex., Clinton, Tenn., and at Clay and Sturgis, Ky., attracted the attention of the press in the U.S. and in many foreign countries; in February Mississippi joined the states which declared legislatively that the U.S. supreme court decisions against segregation were "invalid"; Texas Southern university, a Negro

STATE POLICE ESCORTING NEGRO STUDENTS to school at Sturgis, Ky., after mob violence protesting the racial integration of public schools in 1956

institution, enrolled several white students in September, but a violent crowd prevented two Negroes during the same month from entering Texarkana (Tex.) Junior college; despite picketing, in Oct. 1956, Negroes continued to attend the Lamar State College of Technology, Beaumont, Tex.; threats of violence forced a Negro Methodist church school of Camden, S.C., to discontinue an integrated class in July; Virginia adopted in September a program which would deny state funds to integrated public schools; in September the investigation of integration in the public schools of the District of Columbia by a house of representatives subcommittee led to charges of unfairness; West Virginia State college, a former Negro college, announced in Nov. 1955 that white students made up a third of its student body; the gap in educational achievement between white and Negro pupils was attributed by many educators to inferior school facilities; and a new journal, *Race Relations Law Reporter*, appeared in February with full and impartial documentation on all aspects of the controversial issue of racial segregation.

International Educational Relations.—The annual survey by the Institute of International Education showed 43,309 foreign citizens (36,494 students, 6,033 physicians and 782 teachers and research workers) from 132 nations, 9% more than in the previous year, were engaged in educational work during 1955-56 in 1,660 colleges and universities in the U.S. The institute received in July a ten-year grant totalling \$3,500,000 from the Ford foundation. The National Council on Asian Affairs was formed in Nov. 1955 to promote teaching and research about the nations of Asia. President Eisenhower in May urged that private foundations and universities open scientific and cultural centres to aid foreign nations and promote peace. The Fulbright act for the exchange of students and teachers abroad completed ten years of existence.

The United Nations Educational, Scientific and Cultural organization (UNESCO) had 77 member nations with the admittance of Bulgaria in May, Rumania in July and Finland in Oct. 1956. Late in Oct. 1955 the highest administrative tribunal of the United Nations ordered UNESCO to reinstate four American employees who had been discharged because they had refused to co-operate with a U.S. loyalty investigating board. The Economic and Social council of the United Nations in Dec. 1955 rejected the application by east Germany to join UNESCO on an equal basis with west Germany. Among UNESCO's achievements during the year were the publication in December of *World Survey of*

Education, a source of information on school organization and statistics; the joint sponsorship with the International Bureau of Education in July 1956 of the 19th International Conference on Public Education at Geneva, Switz., with 74 nations discussing problems of school inspection and the teaching of mathematics; and the setting up in August of an international agreement for the protection of artistic and other cultural treasures in time of war.

With ratification by the Netherlands in August, the number of nations signing the Council of Europe's convention on the equivalence of university entrance requirements reached 12. Also in August, the fourth assembly of the World Confederation of Organizations of the Teaching Profession, meeting in Manila, Phil., forced two European teachers' groups to give up their affiliation with the World Federation of Teachers Unions, located in east Germany.

World Trends.—The ministry of education of England and Wales stated in its annual report, released in July, that there were more than 6,500,000 pupils in publicly supported primary and secondary schools. Late in February the national assembly of France voted for the time being to defer consideration of a bill to end state aid to private school, including church school, students. In Belgium there was a controversy between those who wished to preserve and those who desired to weaken the study of Latin and Greek in the secondary schools and universities. In Dec. 1955, 80,000 secondary school teachers went on strike in Italy because of dissatisfaction with the amount of salary increases. In Cyprus primary school children joined violent demonstrations against the British in Feb. 1956, but in September Gov. Sir John Harding permitted the reopening of the island's secondary schools, which had been closed since the previous year because of the students' conduct. University students in Czechoslovakia submitted in May a resolution to the ministry of education in behalf of greater political freedom.

Much attention was given during the year by the U.S.S.R. to the training of scientific and engineering personnel, with full details and figures offered in Nicholas DeWitt's *Soviet Professional Manpower*, published by the U.S. government on Nov. 14, 1955. A U.S.S.R. official report in July indicated that schoolchildren were spending at least one-fifth of their time at school in the study of mathematics, since this subject was considered of the greatest importance for the discovery of special talents for advanced technical and scientific training. The constant stress on science and mathematics led to the protest during the winter by some Russian scholars that the classical studies were being neglected. The de-emphasis of Stalin was carried out by the publication of new textbooks and directives in history. In July the U.S.S.R. announced that a course in Communist party history, plus courses in political economy and historical and dialectical materialism, would be introduced in the fall in all institutions of higher education. The Tass news agency of the U.S.S.R. in January reported an attendance of 1,865,000 students, or 140,000 more than the previous year, in the universities. Also of interest in Soviet education were the announcements in March that church schools were being permitted on Sunday, and in June that a system of boarding schools would be set up and that school fees would be abolished in higher educational institutions and in the highest three years of the secondary schools.

In Dec. 1955 the Argentine government restored the autonomy withdrawn by former Pres. Juan D. Peron to the country's six universities. Ryukyu university in Okinawa in Aug. 1956 expelled six students on "charges of instigating anti-American activities." The Singapore government in Oct. 1956 closed two Communist-dominated Chinese schools and expelled students and

teachers.

In June the Japanese diet abolished the popular election of local school board members and placed the selection of textbooks under the authority of the ministry of education, thus reversing the school reforms introduced by the U.S. after World War II, in view of the fact that these policies had operated in favour of pro-Communist teachers. (W. W. BN.)

Canada.—Enrolment in Canadian public elementary and secondary schools in June 1955 totalled 3,012,700, almost 190,000 more than in June 1954. The number of teachers rose by 6,851 during the same period, to a total of 112,060. Full-time enrolment in institutions of higher education was estimated by the dominion bureau of statistics as 71,600 in Dec. 1955, an increase of 6.2% over Dec. 1954.

Problems arising from the increasing school enrolment continued to constitute a major concern of educational authorities, both provincial and local. The supply of fully trained teachers remained inadequate, despite a noteworthy rise in enrolment in teacher-training institutions. The shortage was becoming acute in secondary schools, where the percentage of increase in enrolment was almost twice as great as that in elementary schools. Several provinces undertook extensive revision of teacher-training plans, partly aimed at securing better integration of elementary and secondary programs; this would facilitate the improvement of professional qualifications of teachers in service who were unable to complete a full university course but who could now qualify as secondary school teachers through a series of steps.

In British Columbia the training of all teachers was placed under the authority of a college of education of the university, replacing the former system of one-year normal college courses for elementary school teachers. Emergency summer training courses were also being employed to improve the supply of secondary school teachers. A plan of this nature in Ontario provided professional training courses in two successive years for persons who were already university graduates.

Another emergency scheme in Quebec enabled "permit" teachers to qualify through summer courses for teaching certificates at either the elementary or secondary school level; previously, full-time attendance at a teacher-training institution had been a prerequisite.

In the field of educational finance, the Quebec provincial government for the second time assumed responsibility for long-term debts of school boards. In 1946 this government assumed such debts, amounting to more than \$100,000,000. Under the new legislation the government would pay half the capital and interest on all long-term debts contracted by school boards in the province since that time, except in two cities.

In Ontario and Alberta major studies were being made of methods of identifying at an early stage high school students most likely to succeed in university courses. Both studies sought to determine whether existing university selection and admission procedures were adequate to locate and encourage potential students, who were urgently needed for the best development of Canada's rapidly expanding economy. Eggs. Production of chicken eggs in the United States in 1956 exceeded the record 67,000,000,000 eggs of 1955 and provided fully 365 eggs per capita for food consumption, 23% more than pre-World War II. In October production was 4% above a year earlier and one-fifth above the ten-year average.

As of Jan. 1, 1956, there were 382,218,000 chickens on farms as compared with 390,708,000 a year earlier and 449,649,000 average for the previous decade; potential layers numbered 359,696,000, a 3% decline as compared with Jan. 1955. Nevertheless, March egg production was 2% larger than a year earlier, in spite of the fact that the flocks contained an uncommonly large proportion of older hens. The replacement hatch was large and early; by October there were 1% more layers than in 1955, and all parts of the country showed record rates of lay per hen.

Egg prices declined as much as ten cents per dozen early in the year but remained above the levels of a year earlier until late spring. In October producers received an average price of 38.1 cents per dozen as compared with 42.9 cents per dozen in Oct. 1955. The poultry ration increased in price during the latter part of the year but remained slightly below 1955 levels. The usual autumnal seasonal rise in egg prices was earlier and less pronounced than in 1955 when prices to producers reached 47.1 cents per dozen. Export of shell eggs, which amounted to 50,000,000 doz. valued at \$20,000,000 in 1955, an all-time high, increased in 1956. (J. K. R.)

Egypt. A republic of northeast Africa, Egypt is bounded north by the Mediterranean, south by the Sudan, east by Israel and the Red sea, west by Libya. Area: 386,100 sq.mi. Pop.: (1947 census) 19,021,840; (1955 est.) 22,934,000. Language: 97% Arabic, with minorities speaking Greek, Italian, Armenian, etc. Religion: Moslem (mainly Sunni) 91.4%; Christian (mainly Copt) 8.19%; Jewish 0.4%. Chief towns (pop., 1947 census, 1952 estimate in parentheses): Cairo (cap.) 2,090,654 (2,367,900); Alexandria 919,024 (1,070,100); Port Said 177,703 (186,300); Tanta 139,926 (147,800); Mehalla el-Kubra 115,758 (131,000); Suez 107,244 (115,200); Mansura 101,965 (118,100). President of the republic and chief executive in 1956: Gamal Abdel Nasser.

History.—The first half of 1956 was largely taken up with preparations, procedural and psychological, for the plebiscite of June 23. Two issues were to be presented to the electors: the confirmation of Col. Gamal Abdel Nasser as president (no other candidate for the presidency was standing), and the approval of the draft constitution announced in January. This constitution purported to safeguard the basic freedoms of speech, worship, association and private ownership. It provided for a unicameral legislature and made the president both chief of state and head of the executive with a six-year term of office. Future presidents were to be nominated by the national assembly (the elected legislature) and confirmed by a popular referendum. All laws were to be approved by the national assembly, which was also to have the power to override the president's veto, to question ministers and remove them by a vote of no confidence and to impeach the president and ministers for high treason. It was to consist of 350 members and to be convened in November. Thus, on the face of it, the constitution was to be the basis of a new democratic life for Egypt, but the democracy it offered was qualified in certain important respects. Many of the paragraphs guaranteeing democratic freedoms ended with the vague phrase "as prescribed by law." Moreover, the candidates for the national assembly were to be hand-picked men, chosen by a nebulous "national union" representing all citizens and organized in a form decided upon by the president.

However, a number of measures were taken before the plebiscite to relax the dictatorship and create a certain feeling of

freedom among the electors; martial law was abolished, press censorship was lifted, a number of political detainees were released and the military junta, the Revolution Command council, was dissolved. Voting was made compulsory for men and optional for women. The results of the poll as announced on June 25 were: for Nasser 5,496,965 votes; against, 2,857; for the constitution 5,488,225; against, 10,046.

Egypt's campaign in the Arab world against Iraq and the Baghdad pact was vigorously pursued during the first half of the year. Nasser's prestige grew steadily throughout the Arab world and his influence became strongly established over Syria, Saudi Arabia and, particularly after the dismissal of Lieut. Gen. J. B. Glubb, in Jordan. In March King Saud and Shukri el-Kuwatli, the president of Syria, met Nasser in Cairo and the three affirmed their identity of views. Later in the year it was announced that Egypt, Syria and Jordan had agreed to a unified army command, to be headed by the Egyptian commander in chief. Toward the Arab league Egypt was increasingly adopting the attitude that that association had proved its bankruptcy and should be replaced by a much closer form of union between the Arab states grouped around Egypt.

In July there was an abrupt and dramatic change of scene from internal Egyptian and Egypto-Arab affairs to an international crisis of the first magnitude. The crisis began with Nasser's announcement in the second half of July that Egypt had decided to accept help from Great Britain, the United States and the International Bank for Reconstruction and Development for the execution of the Aswan dam scheme (this came after several months of uncertainty, following a reported Soviet offer to finance the building of the dam, as to whether Egypt would accept the western or the Soviet offer). No sooner had Nasser announced his decision than the U.S. secretary of state, John Foster Dulles, made a statement to the effect that the United States was no longer willing to give the help it had offered because of doubts regarding the economic soundness of the scheme and Egypt's ability to make an adequate contribution toward it. Another reason for the U.S. change of policy was said to have been that Egypt had been establishing close relations with the U.S.S.R. and had recognized Communist China. The U.S. announcement was followed by similar decisions by Great Britain and the International bank.

To this rebuff from the west Nasser replied by announcing, on July 26, that the Egyptian government had nationalized the Suez Canal company and would use the annual revenue from the canal (about £36,000,000, he said) to build the dam. Shareholders of the company would be compensated in accordance with the last closing prices for canal shares on the Paris Bourse.

Britain and France reacted with extreme vigour to the Egyptian government's action which was described in British notes of protest as an arbitrary action which constituted a serious threat to the freedom of navigation on a waterway of vital international importance. Financial measures were taken by the treasury to freeze Egyptian accounts in the United Kingdom; similar action was taken by France. On July 31 the two governments began taking military and naval measures which were described as precautionary. British and French residents were advised to leave Egypt. The U.S. government froze Egyptian government and Suez canal assets. Discussions in London between representatives of the British, French and U.S. governments resulted, on Aug. 2, in a decision to summon a conference of 24 countries to meet in London on Aug. 16 to consider the establishment of an international body or agency for the Suez canal to ensure that freedom and security of passage were preserved. The 24 countries were the following: Egypt, France, Italy, the Netherlands, Spain, Turkey, the United Kingdom, the U.S.S.R., Australia, Ceylon, Denmark, Ethiopia, the German Federal Republic,

Greece, India, Indonesia, Iran, Japan, New Zealand, Norway, Pakistan, Portugal, Sweden and the United States. They were selected because they were either parties to the 1888 convention guaranteeing freedom of passage through the canal, or because their ships represented an important proportion of the tonnage using the canal or because their geographical position gave them a special interest in it.

At the London conference, which Egypt and Greece declined to attend, the United States put forward a plan for international control of the canal. This plan, slightly amended by Pakistan, Ethiopia, Iran and Turkey, was supported by 18 nations: the five just mentioned as well as Australia, Denmark, France, the German Federal Republic, Italy, Japan, the Netherlands, New Zealand, Norway, Portugal, Spain, Sweden and the United Kingdom.

Another plan was put forward by India for the operation of the canal by Egypt, assisted by an international advisory body representing users of the canal. This was supported by the U.S.S.R., Indonesia and Ceylon.

The 18 nations supporting the majority plan decided to send a five-nation committee headed by the Australian prime minister, R. G. Menzies, to present the plan to Nasser and try to obtain his agreement to it. The committee was received by the president but he rejected the plan, taking his stand on Egypt's sovereignty and the right to nationalize what he considered to be an Egyptian company, while declaring his willingness to respect the 1888 convention and offering to negotiate on such matters as technical advice to Egypt, a "ceiling" for dues, etc.

In mid-September the British government announced that it had, in conjunction with the United States and France, decided to set up a provisional Canal Users' association which other countries would be invited to join and which, it was hoped, would prepare the way for a permanent settlement. A second conference (consisting of representatives of the same 18 countries) met in London during Sept. 19-21 to discuss this plan.

From the beginning, however, it was clear that there were serious differences between the U.S. and the Anglo-French interpretations of the functions of the association. The United States was not willing to use the association as an instrument of coercion against Egypt, whereas Britain and France wanted to use it to establish international control of the canal. However, the association was formally inaugurated on Oct. 1, when 15 of the 18 governments agreed to join it. The U.S.S.R. denounced it. India criticized it.

In the meantime, on Sept. 23, Britain and France asked the Security council of the United Nations to consider the canal dispute. Egypt forthwith brought a countercomplaint. The Security council met on Oct. 5 to consider both complaints. The debate ended on Oct. 14 when the U.S.S.R. vetoed the Anglo-French resolution asking the Security council to approve the Canal Users' association and urging Egypt to co-operate with it. During the debate Egypt made some concessions but did not concede international control.

Deadlock ensued again. Then on Oct. 29 Israeli forces launched a sudden attack on Egypt in the Gaza strip and the Sinai peninsula. On Oct. 30 Britain and France addressed an ultimatum to both sides calling on them to cease all warlike operations and withdraw their forces to a distance of ten miles from the canal, failing which, Anglo-French forces would intervene within 12 hours to stop the fighting and protect the canal. World opinion, revealed in almost every capital and at the UN headquarters, suspected that this ultimatum was a pretext to impose on Egypt the Suez solution which, in their view, Britain and France had since July desired, failing agreement, to enforce by military means. Some observers, indeed, went beyond this. To them the real issue was not the Suez canal but the survival of Nasser; the aim of Britain and France, they considered, was to over-

throw him as a dangerous leader of Arab nationalism both in North Africa and the middle east.

At an emergency meeting of the Security council held immediately after the launching of the Israeli attack, Britain and France vetoed a resolution which called upon the Israelis to withdraw to the armistice line and on all UN members to refrain from the use of force. Egypt rejected the ultimatum and the Anglo-French attack was launched. In New York, to circumvent the Security council veto, the UN general assembly itself was convened in emergency session. On Nov. 2 it passed a first resolution by 64 votes to 5 (only a two-thirds majority was required) calling for an immediate cease fire and the withdrawal of the Israelis to the armistice line. This resolution was defied by Great Britain, France and Israel. The Israelis captured the Gaza strip and pushed their advance deep into the Sinai desert. Meanwhile, after the steady bombing for several days of airfields and other targets in Egypt, Anglo-French troops began to land on Nov. 5 in and around Port Said by sea and air. A second emergency session of the UN general assembly had passed a resolution on Nov. 4 by 57 votes to none (19 abstentions) ordering an immediate cease fire and the creation of a UN police force to keep the peace between Israel and Egypt and bring about a resumption of navigation through the canal, which had been heavily blocked by the Egyptians at several points. This cease fire had been observed by all the parties concerned by midnight of Nov. 6 and the UN police force began to arrive in Egypt shortly afterward.

During the brief period of hostilities quantities of modern Soviet military equipment were captured from the Egyptian forces.

On Dec. 3 the British and French governments announced that they would withdraw their troops from the canal zone and the withdrawals began immediately. British and French salvage equipment had speedily cleared channels for shipping at the Port Said end of the canal and negotiations were opened by the UN authorities for the hiring of salvage ships and equipment to clear the remainder of the canal which was blocked with sunken ships and other obstructions. The last French and British troops re-embarked on Dec. 22. (See also IRAQ; SUDAN; SUEZ CANAL CONFLICT; UNITED NATIONS.)

(E. S. AH.)

Education.—State schools (1953-54): primary 7,492, pupils (1955-56) 1,860,819; secondary (including preparatory) 595, pupils (1955-56) 436,082; vocational 85, pupils (1955-56) 36,398. Teachers' training colleges (1953-54) 80, students 23,051. Institutions of higher education (1955-56) 5 (of which 3 state universities with 60,376 students in 1955-56), students 67,435.

Finance and Banking.—Monetary unit: Egyptian pound with an exchange rate of £E0.348 to the U.S. dollar. Budget: (1953-54 actual) revenue £E206,400,000, expenditure £E199,700,000; (1956-57 est.) balanced at £E326,000,000. Currency circulation (Dec. 1954) £E189,000,000, (Dec. 1955) £E186,100,000. Deposit money (Dec. 1954) £E170,000,000, (Dec. 1955) £E183,000,000. Gold and foreign exchange (Dec. 1954) \$746,000,000 U.S., (Dec. 1955) \$653,000,000 U.S.

Foreign Trade.—(Excluding trade with Sudan, 1955.) Imports £E194,160,000; exports £E140,100,000. Main sources of imports: U.K. 13%; other sterling area 9%; Germany 10%; Italy 8%; other continental E.P.U. (European Payments union countries) 18%; U.S. and Canada 12%; Soviet area 7%. Main destinations of exports: Soviet area 21%; France 9%; Germany 6%; Italy 5%; other continental E.P.U. 12%; U.K. 6%; other sterling area 12%; U.S. and Canada 7%. Main exports: cotton 77%; rice 5%.

Transport and Communications.—Roads (1954) 23,960 km. Motor vehicles in use (Dec. 1954): passenger (including taxis) 71,029, commercial (including buses) 20,487. Railways (1954) 5,797 km. Shipping, merchant vessels, 100 gross tons and over (July 1955) 68; total tonnage 130,571. Telephones (Jan. 1955) 141,320. Radio receiving sets (1954) 650,000.

Agriculture.—Main crops (metric tons, 1955; 1954 in parentheses): maize 1,713,000 (1,753,000); wheat 1,451,000 (1,729,000); barley 127,000 (116,000); rice 1,268,000 (1,118,000); sugar, raw value, 300,000 (262,000); broad beans 262,000 (239,000); lentils 49,000 (60,000); cotton, lint 334,000 (348,000); cottonseed 733,000 (673,000); onions (est.) 791,505 (746,415); potatoes 182,000 (225,000). Livestock (Sept. 1955): cattle 1,362,000; horses 42,000; mules 10,000; asses 927,000; sheep 1,237,000; buffaloes 1,323,000. Fish landed (1954) 23,400 metric tons.

Industry.—Production (metric tons, 1955): crude oil 1,824,000; cement 1,371,600; cotton yarn 73,080; woven cotton fabrics (70% total production) 246,000,000 m.; phosphate rock (1954) 527,000 metric tons; manganese ore (1954) 51,000 metric tons; salt (1954) 450,000 metric tons.

Eire: see IRELAND, REPUBLIC OF.

Eisenhower, Dwight D. (1890–), 34th president of the United States, was born at Denison, Tex., Oct. 14; his parents moved to Abilene, Kan., when he was a year old. He was graduated from the U.S. Military academy at West Point, N.Y., in 1915. (See also his biography in *Encyclopædia Britannica*.) In June 1942, during World War II, he was named Allied commander of the European theatre of operations and headed the invasions of North Africa and Germany that led to defeat of Italy and Germany.

After serving as chief of the army staff at the end of the war, he resigned from active service on Feb. 7, 1948, to become president of Columbia university, New York city. He was recalled to active duty in Dec. 1950 as head of the North Atlantic treaty forces in Europe. He resigned that post as of June 1, 1952, to campaign for the Republican presidential nomination. He was nominated on July 11, and with his running mate, Sen. Richard M. Nixon of California, elected on Nov. 4. He was re-elected along with Nixon on Nov. 6, 1956, in what was generally regarded as a great personal tribute, for the Democrats captured congress in the face of his electoral and popular landslide.

For a while during 1956, there were doubts that Eisenhower would be able to seek a second term because of his Sept. 1955 heart attack. But on Feb. 11, 1956, after numerous medical tests, he announced his decision to run again, adding that his physicians had given him assurance of an "active life for five or ten years." Some prominent Democrats disagreed with this verdict, and publicly deplored the fact that, if re-elected, he would be only a "part-time president."

Eisenhower's health worried Republicans again in June 1956, when he was hurriedly operated on at Walter Reed hospital for an intestinal obstruction, an ailment known as ileitis. But his physicians again pronounced his postoperative condition as excellent, and doubted that there would be any serious recurrences. On the weekend before election, he underwent a two-day medical examination, and on Oct. 28 his physicians reported in an unprecedented and detailed diagnosis that "he gives every appearance of being in excellent health." There arose again in the press a politico-medical controversy over his capacity to perform his full presidential duties, and this issue was injected into the re-election contest, but without any evident effect.

Eisenhower returned to the White House in mid-July after a two weeks' rest at his Gettysburg (Pa.) farm. From July 21 to 23 he attended a conference of American presidents in Panamá, and showed no ill effects from his exertions.

Eisenhower was relatively successful in dealing with a Democratic congress, largely because he eschewed bitter personal or political controversy. His request of \$4,300,000,000 for foreign aid was cut to \$4,100,000,000, a compromise which he accepted. Besides providing \$41,500,000,000 for national defense, congressional Democrats forced an additional \$900,000,000 on him for heavy bombers.

He vetoed a Democratic farm bill because it provided for rigid 90% price supports, but congress passed his measure for lower and flexible payments. He obtained a \$33,000,000,000 highway construction program. There was no action on his five year, \$2,000,000,000 school building project because of northern Democrats' insistence that federal funds be withheld from communities which failed to abolish segregation.

He accepted two Democratic proposals. Although he favoured raising the hourly minimum wage from 75 to 90 cents, he approved the opposition's \$1 figure. He also agreed to their amendments lowering to 62 years the age at which women become eligible for Social Security benefits, and to 50 the age when totally disabled persons may collect federal payments. Although he approved its basic principle, he vetoed a natural gas act relieving that industry of federal control because of the questionable be-

MRS. DWIGHT D. EISENHOWER AND SON, Maj. John Eisenhower, arriving at Walter Reed Army hospital, Washington, D.C., after learning of President Eisenhower's attack of ileitis in June 1956

haviour of the "natural gas lobby."

On foreign affairs, Eisenhower sought to cement the free world against the Communist menace. He rejected Soviet Premier N. A. Bulganin's proposal for a 20-year peace treaty because of the postwar failure of the U.S.S.R. to keep previous promises. After a visit from British Prime Minister Anthony Eden in February, the two issued a communiqué reaffirming U.S.-British belief in the "self-determination of peoples." They also cautioned free nations against reliance on the U.S.S.R. for economic or political aid lest they mortgage their independence. Other foreign visitors in 1956 included Pres. John Costello of Ireland, Pres. Giovanni Gronchi of Italy, Pres. Sukarno of Indonesia, Chancellor Konrad Adenauer of Germany and numerous South American statesmen.

Eisenhower proposed to Bulganin that the U.S. and U.S.S.R. join in ending production of nuclear weapons for war, but without success because of Soviet opposition to an international inspection system. But at the year's end 82 nations had agreed to the president's earlier proposal for an international atomic pool devoted to peacetime use.

Eisenhower gave considerable thought to improving relations with western hemisphere neighbours. In March he spent several days at White Sulphur Springs, W. Va., in informal conferences with Pres. Ruis Cortines of Mexico and Canadian Prime Minister Louis Stephen St. Laurent. At the Panamá conference in July he urged the "beneficial use of nuclear forces for peaceful purposes throughout the Western Hemisphere." With the other American presidents, he signed a "declaration of ideals" which advocated devotion to freedom, opposition to totalitarianism and full economic development of the western hemisphere resources.

In accepting renomination at San Francisco, Calif., Eisenhower pledged that the G.O.P. would be "the party of the future," and

he waged his campaign on that basis. He again declared his purpose of "liberalizing" and "modernizing" it. His principal appeal to the voters was that his administration had brought "peace, progress and prosperity" without war activities or expenditures. He stressed the fact that he had ended the Korean conflict, and had emerged from such crises as those in Indochina and Formosa, the Israeli-Arab dispute and Suez canal controversy without war.

He also emphasized that national income, wages, employment and other economic indexes were at a record figure. Travelling more extensively and speaking more frequently than he had originally intended, on television and in countryside appearances, he proved to the people and politicians that he was far more popular than the party he headed.

Eisenhower undoubtedly benefited from overseas events in the closing weeks of the campaign. He sponsored United Nations resolutions condemning the U.S.S.R.'s brutal behaviour in Poland and Hungary. He expressed his firm disagreement with Israel and the major U.S. allies in Europe, Britain and France, when they invaded Egypt. He promised that there would be "no American involvement" in that conflict. He characterized Adlai E. Stevenson's proposal to end the draft and H-bomb tests as "incredible folly."

In accord with his relaxed routine, the president spent many weekends at his Gettysburg farm with other short visits to his Augusta Country Club cottage and to Sec. George M. Humphrey's Georgia plantation, where he fished and hunted.

The only important changes in his official family during the year were the substitution of former Sen. Fred A. Seaton of Nebraska for Douglas McKay of Oregon as Secretary of the Interior, and the appointment of Justice William J. Brennan, a New Jersey Democrat, to the supreme court. He succeeded Justice Sherman Minton of Indiana, who resigned because of ill health. (See also ELECTIONS, U.S.; POLITICAL PARTIES, U.S.; UNITED STATES.) (R. TU.)

Eisenhower, Milton Stover (1899–), U.S. educator, brother of Pres. Dwight D. Eisenhower and one of the latter's closest advisers, was born at Abilene, Kan., on Sept. 15. He took his bachelor's degree at Kansas State college in 1924. While in college he was city editor of the *Abilene Daily Reflector*, and after graduation was for a time assistant professor of journalism at Kansas State college.

Eisenhower was U.S. vice-consul at Edinburgh, Scot., 1924–26, after which he served in a series of government posts—assistant Secretary of Agriculture William M. Jardine in the Coolidge administration; public relations director of the department of agriculture, 1928–40; land use co-ordinator, 1937–42; director of the War Relocation authority, 1942; and associate director of the office of war information, 1942–43. From 1943 to 1950 he was president of Kansas State college, then for the next six years president of Pennsylvania State university; in 1956 he was named president of Johns Hopkins university. He also served on a number of official and semiofficial federal commissions and boards, and from 1953 was President Eisenhower's personal representative for Latin-American affairs; in the summer of that year he made an extensive tour of South America as a special presidential envoy.

Elections, U.S. Pres. Dwight D. Eisenhower rolled up an unprecedented total of about 35,500,000 votes to win a second and final term in the presidency in the Nov. 1956 elections. Automatically elected with him was Vice-Pres. Richard M. Nixon. Defeated by about 9,500,000 votes, Adlai E. Stevenson, the Democratic nominee, and his vice-presidential running

mate, Sen. Estes Kefauver of Tennessee, carried only seven states.

In carrying 41 states, including several in the south and the political border areas, Eisenhower received 457 electoral votes, 191 more than the 266 needed for election. Stevenson got a total of 73¹ from the seven states he carried—Alabama, Arkansas, Georgia, Mississippi, Missouri, North Carolina and South Carolina. It was the worst defeat for a presidential candidate since Franklin D. Roosevelt's 523-to-8 electoral vote landslide over Republican Alfred M. Landon of Kansas in 1936.

Riding a wave of personal popularity that carried into every corner of the country, Eisenhower won about 57% of the two-party vote for president. This compared with the 55.4% of the vote he got against Stevenson in 1952 when Eisenhower won 15 fewer electoral votes.

But despite the president's tremendous political sweep, Democrats retained control of congress and gained a net of two governorships in 30 ballot contests, including that in Maine in September when Democratic Gov. Edmund S. Muskie won re-election. The 1956 election results provided the first instance since 1848 that a president had not carried his party along with him to control of at least one of the houses.

In the Nov. 1956 voting, Democrats retained numerical control of the senate by the same margin they had had in the 84th congress, 49 Democrats to 47 Republicans. Sen. Lyndon B. Johnson of Texas, the Democratic majority leader, had predicted that his party would retain control of the body, despite some indications that Republicans might benefit by absences of members when the organization test came or might gain strength through the resignation from the senate of Sen. Price Daniel to become governor of Texas in Jan. 1957.

The party standoff in the election came through the exchange of eight contested seats. Democrats took over Republican senate

seats in Ohio, Idaho, Pennsylvania and Colorado, defeating Republican incumbents in all except Colorado, where Sen. Eugene Millikin had retired in favour of another G.O.P. nominee, former Gov. Dan Thornton. Aided in some instances by Eisenhower's landslide, Republicans captured Democratic seats in New York, West Virginia and two in Kentucky.

Including vacancies caused by deaths and resignations, there were 35 senate seats at stake in 33 states in the November voting. South Carolina and Kentucky each filled two seats, and
